Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

+ *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.

+ *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.

+ *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.

+ *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter `http://books.google.com` durchsuchen.

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

Twenty-five Years of Transport.

"A new era is dawning upon the Carrying World, the motor wagon opening up vast possibilities for the immediate future."—*The World's Carriers, October 15th*, 1904.

IT is not easy to find words in which to put in writing one's thoughts on the completion of a quarter of a century of work in connection with transport, and if, on this occasion, I depart from the use of the editorial "we," I trust I may be forgiven by those who are sticklers for the strict etiquette of the profession. Writing in October, 1929, it is difficult to visualise the position of the transport industry in October, 1904, when the first number of this journal saw the light of day.

The words which I have placed at the head of this article, taken from the first issue, formed the foundation of our belief that a trade journal, dealing with all kinds of transport, but specially chronicling the developments in road transport which we then foresaw, was needed, and the first number was published with high hopes that *The World's Carriers* would be given the privilege of assisting in such developments. At that date railway transport was adequately represented by several old-established journals and the same could be said of the shipping trade. Road transport alone had no organ to voice its interests, to record month by month happenings of particular importance to those engaged in this industry, and, if the word may be allowed, to educate the members to the advantages of a new form of traction which was not only in its infancy, but was looked upon with suspicion and prejudice by those whose business had been built up on horse transport. It was natural therefore that, while dealing with transport generally, *The World's Carriers* should have a special leaning towards road transport. The proposed journal was accorded enthusiastic support by such well-known firms as Carter, Paterson & Co., Ltd., Pickfords, Ltd., The London Parcels Delivery Co., Ltd., Beans Express, Ltd., Chaplin & Co., Ltd., Thos. Tilling, Ltd., and I am proud to say that the friendships then formed have continued until the present time and that this journal starts on its second quarter of a century with the good wishes not only of these firms, but of the leaders in every branch of transport—men occupying the highest positions in the associations and organisations with which we have been closely identified.

It may be considered quite unnecessary for me to write anything, in view of the galaxy of talent contributing to this Twenty-fifth Birthday Number—men who speak with authority on the different branches of transport with which they are connected, and indeed such a symposium leaves little to be said on any branch of transport taken by itself, but the mission of this journal may be summarised as an attempt to co-ordinate all kinds of transport and to take the broad view, which is so difficult for anyone, however able, whose work of necessity compels him to devote his energies to one phase only of the industry. Sir Josiah Stamp, the new President of the Institute of Transport, in a fine address to the Metropolitan Graduate and Student Society, reported in this issue, emphasised the necessity for a broad-minded and comprehensive outlook, as the great need of the day and pointed out how fortunate the new generation of transport men was in this respect. Possibly his Presidential address, which, all being well, will have been delivered before this issue is in the hands of our readers, may have made other suggestions of an important character, but we cannot imagine that even he, with all his genius for saying the right thing, can set forth any views more deserving of the attention and earnest consideration of transport men than that statement. This is indeed the era of co-ordination and co-operation and it will tax the abilities, the energies, and the perseverance of the coming generation to get out of the groove, in which their fathers have worked, and, while being specialists in their own departments, to have that vision of transport as a whole which is so essential.

Digitized by Google

The period of twenty-five years can be divided, and in fact divides itself into two clearcut periods of ten years each—1904 to 1914 and 1919 to 1929, with the Great War period in between, forming a gulf between the two decades, which seems to place the first period in the far-away distant past. The first ten years was a time of steady though slow development, in which the principal events to be chronicled were the increasing use of motor vehicles and the successful efforts made by pioneer motor manufacturers to produce vehicles which should be efficient and economical. A feature of this issue is a brief history of some of these firms. Mr. J. Maughfling, President of the Society of Motor Manufacturers and Traders, records in his contribution the missionary work undertaken at heavy cost by motor manufacturers in those early days, and the article by "A Pioneer," which will be read with interest by those who were engaged in motor transport twenty-five years ago, puts the other side of the picture and shows what difficulties those pioneers had to fight against in their endeavours to make a living.

In 1904 the Commercial Motor Users' Association, then called The Motor Van & Wagon Users' Association, had been in existence for twelve months and probably the founders never imagined in their wildest dreams that it would become so important and influential an organisation, that H.R.H. The Prince of Wales would honour it by becoming its guest at its Twenty-fifth Annual Banquet. The cartage trade had its influential associations in London—The London Master Carmen & Cartage Contractors' Association, now known as the London Cartage & Haulage Contractors' Association, and the Metropolitan and Home Counties Road Transport Contractors' Association, working in harmony with the Liverpool Cart Owners' Association, now the Liverpool Cart and Motor Owners' Association, and the Manchester Team Owners' Association, now the Manchester Transport Owners' Association. The removal industry had founded a national association, called the Furniture Warehousemen & Removers' Association, in the year 1900, and this was already making good progress in watching over the interests of its members when this journal was started. The horse vehicle owners were represented also in London by the Jobmasters' Protection Association, afterwards the United Horse Owners' & Allied Trades Protection Association. In 1909 the National Union of Horse Vehicle Owners was formed and did splendid work on behalf of this branch of transport up to 1921, when it was amalgamated with the National Alliance of Commercial Road Transport Associations, previously formed in 1918, the two bodies becoming the National Road Transport Employers' Federation. The shipping and forwarding trade was being well served in London by the London Shipping & Forwarding Agents' Conference and in Liverpool by the Liverpool Shipping & Forwarding Agents' Association and these two organisations have done yeoman service for their members at the great ports of London and Liverpool. Later the Manchester Shipping & Forwarding Agents' Conference was formed to look after the shipping trade in the Port of Manchester.

The process of improvement and development in transport went on year by year until the outbreak of the Great War threw everything into the melting pot. Shipping and Forwarding almost ceased to exist; railway transport became part of the military machine; road transport vehicles were commandeered and business was completely dislocated. The result of the Great War for road transport was to do in four hectic years what might have taken at least ten under ordinary conditions and the end of the War saw motor transport firmly established as an alternative system to rail transport.

The chief event of post-war days was the founding, in 1919, of the Institute of Transport, the history of this new venture being written for us by Mr. A. Winter Gray, the able and hard-working secretary. Although it is only ten years since it was founded with the support and active help of all branches of transport, it has attained already a position of great influence and undoubtedly has raised the status of transport to a higher level than before its advent. Although it is so young comparatively, yet to the younger men in the industry it is already of old standing and its influence as an educational force has been of great value. That it has still more important work to do is clear to all those who take an active interest in its work.

The railways have laboured under great disadvantages since the war, as after being under Government control with all that means, they were handed back to the owners and managers with enormous leeway to make up in rolling stock and equipment. They were then forced to combine into groups, willy nilly, and it is even yet too early to say with what permanent results. After a tremendous struggle lasting many years they secured parliamentary powers to run road services and they have now become owners of or partners in many passenger road transport organisations. Where this is leading them it is difficult to say. They have also secured air transport powers.

It is difficult to realise that, as Sir Sefton Brancker states in his contribution, air transport had already made a very small beginning the year before this journal was started, but it is only since the close of the Great War that civil aviation has become a real factor in transport, opening up new vistas, which may lead us—who knows where. Mr. James Paterson, in his interesting contribution, asks a number of questions and particularly inquires what will be the position of transport in another twenty-five years' time. What the future has in store for transport is in the lap of the gods. For myself I believe the future of transport is in the air, whether by improved giant airships, the outcome of the experiments, which are being made in the R101, as reported in this issue, and the R100, nearing completion at Howden, Yorks., or by means of giant flying boats, such as that built by Dr. Dornier in Germany, capable of carrying from 60 to 100 passengers, I do not pretend to say, but I am convinced that the next generation will take as naturally to the air and to aerial transport as this one has done to the road and the motor vehicle.

As regards internal transport, I believe that the day of the fixed rail is passing and although, owing to the immense capital invested in our railway and tramway systems, it may be many years before these are entirely scrapped, yet I am confident that the future is with the small mobile unit, carrying passengers and goods from door to door and that the day will come, when our railway tracks will be turned into motor roads for fast traffic, which will travel at a speed that will put into the shade anything which we have yet seen.

Whether these views will prove true or not, time alone can show, but in any event, the position of transport will be one of ever-growing importance, for as has often been said, Transport is Civilisation.

Notes and News.

Deputation to the Minister of Transport.—A deputation representing the Transport and General Workers' Union, introduced by Mr. Bevin, recently waited upon Mr. Herbert Morrison, the Minister of Transport. The deputation urged the desirability of introducing more widely, and particularly in London, vestibule fronts on tramcars, which are already used in many provincial areas, so as to secure the greater protection and comfort of the drivers. Mr. Morrison said that it had already been intimated that the Ministry had no objection to such vehicles being tried, but that the decision rested with the Tramway undertakers, with whom he would communicate. The deputation also drew attention to certain aspects of the London Traffic problem, and the need for early legislation. They further stressed the importance of passing, without delay, a Road Traffic Bill, including among other points to which they referred, a reform of the present system of licensing public passenger vehicles and the introduction of a system of compulsory insurance on the lines recommended by the Royal Commission on Transport. Mr. Morrison said that he was giving his close attention to these matters and would give full consideration to the views which had been advanced by the Union.

Dates for Furniture Removers to Note. — The Bi-Annual Meeting of the Furniture Warehousemen and Removers' Association will be held at Birmingham on November 14th and 15th next at the Imperial Hotel, Temple Street. The general meeting will be held on November 14th at 2.15 p.m., to be followed in the evening by a Dinner and Entertainment, tickets for which cost 10/6 each. Ladies are invited to be present at the Dinner. Two very interesting conducted tours have been arranged for the following day, November 15th, members and their ladies having the choice of (a) a tour of Fort Dunlop with lunch and tea at the kind invitation of the Dunlop Rubber Company, Ltd., (b) a tour of the works and model village of Messrs. Cadburys, Bournville, returning to the Imperial Hotel for lunch, at the kind invitation of the Midland centre of the Association. It is hoped that there will be a record attendance at the meetings.

TWENTY-FIVE YEARS OF TRANSPORT.

By HERBERT MORRISON, M.P.
Minister of Transport.

It is now recognised as a truism that the provision of adequate facilities for the transportation of both goods and passengers—whether by air, water, rail or road—is as essential to civilisation as is oxygen to life. The complexity of the technical, commercial and other questions arising in connection with the growing volume of transport which the country demands makes the existence of technical and specialised publications in turn a matter of great utility and interest.

MR. HERBERT MORRISON, M.P.,
MINISTER OF TRANSPORT.

It is, therefore, with pleasure that, on the occasion of the twenty-fifth anniversary of the publication of *The World's Carriers,* I send this message of congratulation to the Editor on the services which his journal has rendered during the last quarter of a century in keeping those who are concerned with the business of transportation informed of the developments which have taken place throughout the world.

Lectures and Classes on Railway and Cognate Subjects — London School of Economics.—The syllabus of lectures and classes on railway and cognate subjects for the session 1929-30 has been issued by the London School of Economics and Political Science (University of London), Houghton Street, Aldwych, London, W.C.2. On all hands it is recognised as desirable that young men should be incited to an intellectual interest in their daily work. A practical difficulty, however, lies in the reconciliation of study with the necessity, according to general experience, of entering upon business at an early age. To meet this difficulty the University of London has organised a curriculum—leading up to a degree if that be desired—of such a character that daily work in the office, when supplemented by the best attainable instruction, shall be accepted as equivalent to the laboratory work of the student of natural science or the library work of the literary student. In other words, the intention is to obtain the advantages of intellectual culture by the co-ordinated practical and theoretical study of subjects which are the life of the business man. Full information may be obtained upon application to the Secretary at the School.

General Motors, Ltd.—The Sales Organisation of Vauxhall Motors, Ltd., has been brought down to General Motors, Ltd., The Hyde, Hendon, and the Vauxhall factory, at Luton, will be confined entirely to manufacturing the products of General Motors, Ltd., and it is here that Chevrolet cars and trucks will be produced in future. Mr. A. F. Palmer Phillips has been appointed Director of Sales of all General Motors lines.

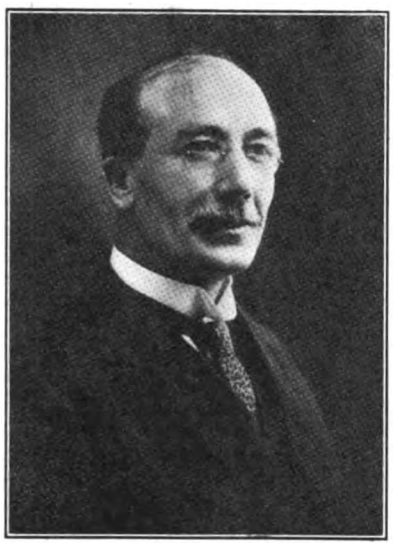
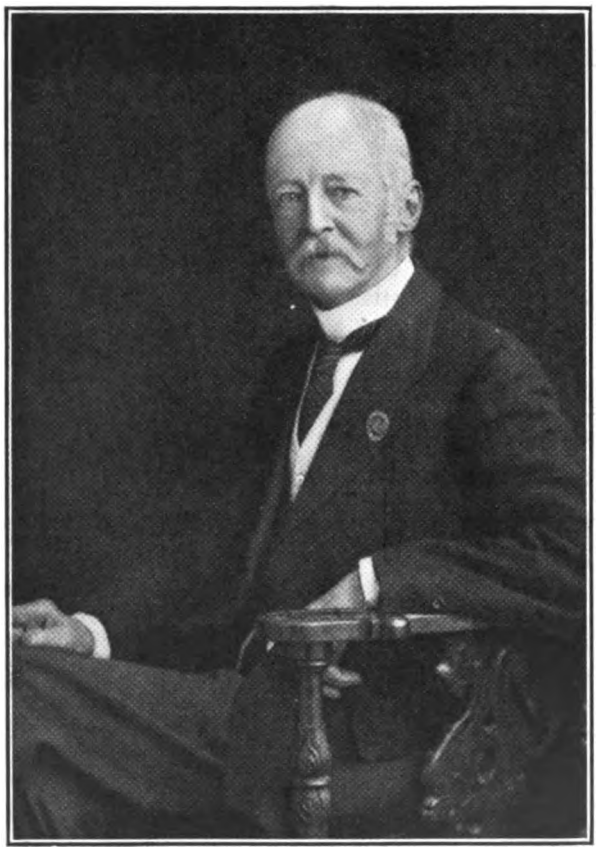
Municipal Tramways and Transport Association. New President.—At the Annual Conference of the Municipal Tramways and Transport Association, held at Great Yarmouth last month, and reported in our September issue, Alderman Thomas Canby, J.P., Mayor of Huddersfield, was unanimously elected President for the ensuing year. Mr. Canby was elected a member of the Huddersfield Town Council in 1911 and made an Alderman in August, 1922. He was made a Magistrate in November, 1923. He has always taken a very deep interest in Tramway matters and has been Chairman of the Tramways Committee since 1921, previous to which date he was for many years Deputy Chairman of that Committee. He has been Deputy Chairman of the Estate Committee of the Corporation since its formation in 1920. In 1928 he was unanimously elected Mayor of the town. Alderman Canby is one of the outstanding figures of the Town Council, one of "The big five." He is a popular personality, and in 1925 was the President of the Rotary Club.

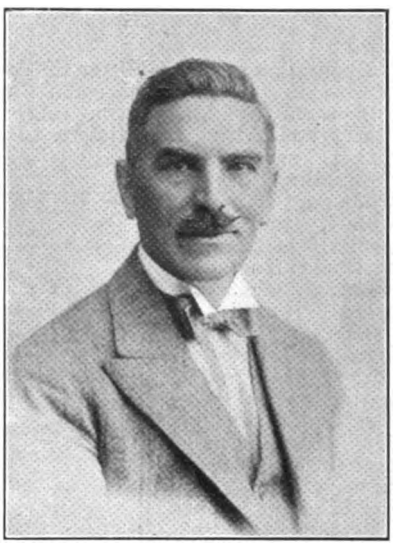


ALDERMAN THOMAS CANBY, J.P., MAYOR OF HUDDERSFIELD. PRESIDENT, MUNICIPAL TRAMWAYS AND TRANSPORT ASSOCIATION.

A Great Record.—Carter, Paterson & Company was founded in 1860 and the firm have in their strong room the first trading account drawn up by Mr. C. H. Nevill for the period to the 30th June, 1861, and he has written up every set of accounts each half-year since, and the style of the writing in the last accounts is almost identical with that of sixty-eight years ago. Truly a wonderful achievement. Throughout this long period Mr. Nevill has been greatly respected by all the Partners and Directors of Carter, Paterson & Co., Ltd., and last September the shareholders of the Company unanimously resolved to present to him his portrait in oils. Mr. Nevill, many years ago, founded the well-known firm of Chartered Accountants, Nevill, Hovey, Gardner & Company. He was one of the earliest volunteers, rising to the rank of Lieut.-Colonel in the First Surrey Rifle Corps.



LT.-COL. C. H. NEVILL, V.D., F.C.A.



MR. H. P. STOKES, M.I.E.E., A.M.I.MECH.E.

United Automobile Services, Ltd.—We are pleased to be able to reproduce a photograph of Mr. H. P. Stokes, M.I.E.E., A.M.I.Mech.E., M.I.A.E., M.Inst.T., engineer and general manager, City of Plymouth Transport who, as announced in our September issue, has been appointed general manager of United Automobile Services, Ltd.

Motor Show at Olympia.—The Motor Show, which opens at Olympia on October 17th and continues until the 26th of the month, will be the 23rd international exhibition arranged by the Society of Motor Manufacturers and Traders, and it is an exhibition which should on no account be missed by anyone interested in motoring. The Exhibition is open from 10 a.m. to 10 p.m., and the following charges will be made for admission:—Thursday, October 17th, 10/-; Friday and Saturday, October 18th and 19th, 2/6; Monday to Thursday, October 21th to 24th, 5/-; Friday and Saturday, October 25th and 26th, 2/6.

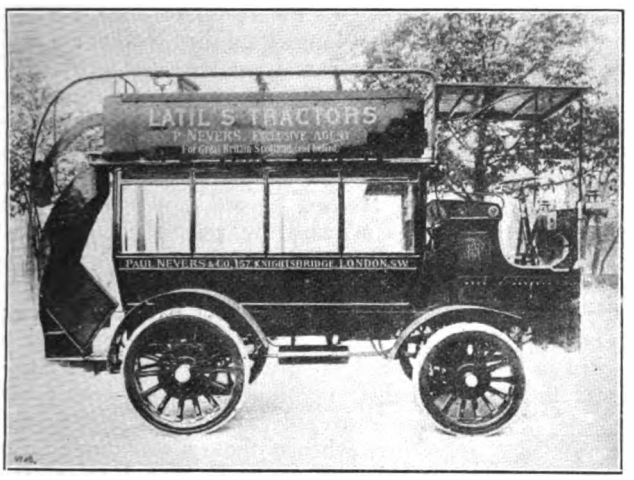
Chrysler Motors.—Mr. C. Morton Lomax, who has been associated with Chrysler Motors, Ltd., as Director and Treasurer for the past ten years, has been placed in charge of operations of both Chrysler Motors, Ltd., at Kew, and of Dodge Brothers (Britain), Ltd., at Park Royal Road, North Acton. This is one of the developments consequent upon the acquisition of Dodge Brothers' interests by the Chrysler Corporation. Mr. Macaire, the late Managing Director of Chrysler Motors, Ltd., at Kew, has resigned, and the very onerous duties which the control of these two companies must bring about now fall on the shoulders of Mr. C Morton Lomax.

MR. C. MORTON LOMAX.

Port of London Authority—Publicity Department. — In order to co-ordinate the various duties comprised in the words publicity and propaganda, the Port of London Authority has decided to set up a special department to deal with these matters, and Mr. A. E. Wildey has been appointed publicity officer and Mr. E. K. Holmes has been appointed assistant publicity officer. Mr. Wildey entered the service of the Thames Conservancy in 1896,

Digitized by Google

and after serving in various departments for thirteen years, he was transferred to the Port of London Authority in 1909. He acted first as personal assistant to the secretary of the P.L.A., and later became clerk to the Dock and Warehouse Committee under Sir Joseph Broodbank. He was then appointed chief of the charges and canvassing department of the Port of London Authority, and in 1924 became assistant to the commercial manager. This position he now relinquishes to take up his new office.



A LATIL OMNIBUS ON THE LONDON STREETS IN 1903.

£100 Reward.—Very acceptable to the recipient will be the £100 reward offered by Harris & Hasell (1929), Ltd., manufacturers of the new B.A.T. Cruiser Chassis. It is claimed that the "Cruiser" represents the very latest developments, yet Harris & Hasell are eager to incorporate any possible improvement, and a prize is offered for suggestions for improving efficiency, driver-comfort, braking and body-mounting. £100 is offered for the best practical improvement sent in before November 30th, 1929. A number of Consolation prizes are also offered. An entry form and fully illustrated specification will be forwarded to any of our readers if they send their name and address to Harris & Hasell (1929), Ltd., St. Georges Road, Bristol. The B.A.T. Cruiser Chassis can be inspected at the Bristol or London Showrooms or at the Commercial Motor Show, Olympia, Stand No. 120.

Pickfords at the Shipping Exhibition.—Pickfords, Ltd., were appointed official Lifting and Haulage Contractors to the Shipping, Engineering and Machinery Exhibition, which was held at Olympia last month. The whole of the heavier lifting was carried out by means of Pickfords petrol-electric mobile cranes. The address of Pickfords

ONE OF PICKFORDS MOBILE CRANES HANDLING A HEAVY EXHIBIT FOR THE SHIPPING, ENGINEERING AND MACHINERY EXHIBITION.

heavy mechanical haulage department is 151 Tower Bridge Road, London, S.E.1.

Electric Trolley Buses: Brazil.—The Commercial Secretary at Rio de Janeiro (Mr. S. G. Irving) reports that a syndicate in Brazil, having in view the establishment of a service of electric trolley buses over a distance of 100 kilometres, desire to receive literature from British manufacturers. Details of the enquiry can be obtained by interested British manufacturers upon application to the Department of Overseas Trade, 35 Old Queen Street, London, S.W.1. Reference number A.X. 8616 should be quoted.

Commercial Motor Exhibition, Olympia.

Programme of Conferences.

A NUMBER of Conferences will be held as usual during the Commercial Motor Transport Exhibition at Olympia, and although the arrangements are not complete it will be well for those of our readers who are interested to bear the dates and names of the Conferences in mind:—

Friday, 8th November. — 11 a.m. Conference by Railway Companies.

Monday, 11th November. — 11 a.m. Conference by Incorporated Association of Retail Distributors.

Tuesday, 12th November.—11 a.m. Conference by Tramways' and Light Railways' Association, and Omnibus Owners' Association.

Wednesday, 13th November.—11 a.m. Conference by Commercial Motor Users' Association.

Thursday, 14th November.—11 a.m. Conference by Municipal Tramways and Transport Association.

THE WORLD'S CARRIERS
CARRYING TRADES' REVIEW

COMMERCIAL MOTOR TRANSPORT EXHIBITION.

OLYMPIA. NOVEMBER 7th-16th, 1929.

We shall be glad to welcome our friends at our Stand No. 141. One of our staff will be in attendance to discuss road transport matters.

OUR NOVEMBER ISSUE WILL BE A SPECIAL NUMBER AND WILL CONTAIN A FULL AND ILLUSTRATED REPORT OF THE TRANSPORT VEHICLES & ACCESSORIES TO BE EXHIBITED.

Twenty-Five Years of Transport, 1904-1929.

Co-Ordination of Transport and the Railways.

By Sir Josiah C. Stamp, G.B.E., D.Sc., LL.D.

President of the Institute of Transport.
Chairman and President of the Executive, London, Midland and Scottish Railway.

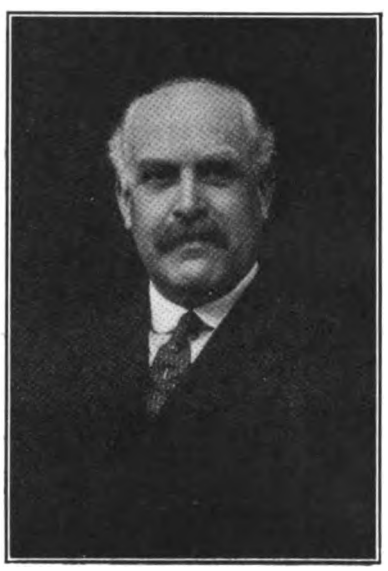
THE last quarter of a century has witnessed a greater revolution in land transport than any other similar period with the possible exception of the years 1825-1850, which heralded the coming of the Railway Era in Great Britain.

Whilst continuous progress has taken place in the sphere of railway transport, notably as regards electrification, the use of high pressure steam, and reduction of fuel consumption per ton-mile, the power-driven road vehicle has achieved a degree of perfection which has entitled it to challenge the railway for a large section of the latter's revenue.

It may be said, in truth, that after the war the road vehicle with the internal combustion engine attained the status of manhood, and took up a position in regard to the railway, which is more truly described as complementary than supplementary.

Similarly, in the air the internal combustion engine has introduced a further form of transport facility. It will hardly be denied that these developments outstripped the science of the regulation of transport movements, and, as with any industrial process of development, a period of acute competition was bound to exist before each means of transport reached a stage of equilibrium where it was enabled to demonstrate its sphere of maximum utility to the general public.

The policy of *laissez faire* has not been fashionable in recent years, and public opinion, backed by the losses suffered by shareholders in competitive transport organisations has slowly turned away from encouragement of competition, as witnessed by railway legislation before the war, to the present encouragement of co-operation and co-ordination between various forms of transport, as seen by the decision to grant the railways their road powers last year, and their air powers this year. London traffic co-ordination has also received the strongest support from every quarter. Thus the railways have been faced with the task of bringing the various co-equal forms of transport into their true economic relation in order that the user of their services may benefit to the maximum degree.



SIR JOSIAH C. STAMP, G.B.E.

It is frequently forgotten that the British railways, from their inception, have adopted a policy of co-ordination of all types of transport facility to a greater degree than any railways abroad. Collection and delivery of goods, hotel accommodation, cross-Channel steamers, warehousing, and dock ownership, all bear witness to the foresight with which the early railway managers embraced the spirit of co-ordination. A perusal of Mr. Sherrington's "Economics of Rail Transport," is a serviceable reminder of the many stages of development. But with the coming of the road competitor, such policies had to be placed upon an even wider basis. Probably within the last three years, more progress has been made in this connection than in any twenty-year period in British railway history.

It is difficult, within strict limitation of space, to outline, even in brief, the many forms within which this policy has been shaped. In the realm of freight movement, additional to the long-established collection and delivery services, recent years have seen the growth of widespread motor lorry services in country districts. Centres have been established from which these radiate over a defined area in the fashion of a spider's web, offering each and every trader at an agreed scale of charges a transport service unexcelled abroad, and which is not even reserved for goods which travel part of their haul by rail.

With the rise of prices came the desire of every retailer to reduce his stock in trade to the barest minimum; to meet this situation and to help release the capital thus locked up for more productive work, the railways introduced their railhead distribution schemes, whereby goods are conveyed in bulk to a railhead store, whence the railway undertakes to deliver in retail over a wide area for a specified firm.

Closely akin to this system is the now famous container service which is virtually equivalent to the transfer of the wagon body at will from road to rail or vice versa. With the narrow margins of profit on which much business is now conducted, it is essential that loss and damage be kept to the absolute minimum. Door to door service by means of a container, which yet makes use of the fast long-haul railway movement, successfully eliminates this risk of damage and the cost of transhipment.

The power required to move any given weight is less on a railway than on a road, due to the greater absence of friction, but frequently the absence of transfer and transhipment costs make the total movement by road cheaper than that by rail if one includes the risk of damage arising from the handling and re-packing.

The container method is a scientific attempt to better transport service by co-ordinating the door to door service offered by road transport with the more rapid and cheaper cost of movement over a considerable distance by rail.

Comparative costs of movement by rail and road are, however, continually fluctuating; changes in the cost of petrol, an alteration in the wage scale, improvements in steam locomotive design or new scales of road vehicle taxation, alter the balance of advantage to one side or the other, much as the ripples caused by pebbles thrown into a pond cross, intersect, and counteract one another.

It is clear that in certain cases motor vehicle movements will replace movements by rail; specially urgent consignments to catch a ship whose sailing is controlled by tides, or the avoidance of a congested terminal area, might be regarded as examples. For this reason co-ordination of facilities is to be welcomed because by that means is eliminated the desire to utilise a certain type of movement which may not be the most beneficial from the point of view of the trader.

Whilst primarily to be regarded as a branch of passenger traffic movement, the carriage of parcels and other

Digitized by Google

small consignments is in reality betwixt and between the movement of passengers and that of goods. The growth of retail trading has tended to increase the economic importance of this service, in which the question of speed is vital. Passenger trains carry much of this traffic by rail, and by road it is handled by the motor vehicle. No country abroad benefits from such a closely-woven network of road services as does Great Britain, and the co-ordination of road and rail to bring about the fastest and most efficient service between consignor and consignee is to be welcomed on every count.

As with freight traffic, the long haul passenger traffic under present conditions can best be handled by rail, but to offer the general public a travelling facility of maximum utility this must necessarily be linked closely with a door to door passenger service.

The value of road space is becoming increasingly important, and the public service vehicle, if sufficiently engined to ensure adequate accelerative and braking power, is socially preferable to the private car in view of the better seating capacity per square foot of road surface.

The function of the motor bus on country routes dovetails admirably into the collection and delivery service of rail-borne parcels and mails, for where traffic density is light it proves an admirably economical unit for carrying both passengers and parcels.

Co-ordination of rail and road facilities as regards passenger traffic must necessarily take the form of reaching a reasoned relationship between the fares charged in each case based on economic considerations, and convenient points of exchange, such as railway termini, must be established between the two services so as to ensure a maximum of convenience for the travelling public.

Much benefit is likely to be attained by the increased inter-availability of tickets between the two services, while combined road and rail arrangements are likely to become increasingly patronised by the public for pleasure or business.

Co-operation with road services will allow the replacement of lightly loaded branch line trains by the small and more convenient unit, the motor bus, and although a certain amount of opposition to such change is to be expected, judging by experience abroad, the continuation of unnecessary expenditure which does not supply a real social want will hardly appeal to the majority.

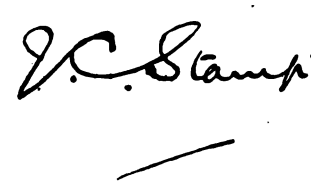
Reduction in train density on certain lines resulting from this policy should enable many long distance trains to be speeded up, and economies consequent upon this increased rate of movement will be divided between the trader, the travelling public and the railway shareholder.

Whilst air travel, especially under the weather conditions which usually prevail in Great Britain, may yet be regarded as in its infancy, there is little question that air services during the coming years will play an important part in the realm of passenger traffic movement, as well as in the transport of valuable commodities.

With their air powers, the railways are in a position to take advantage of the time when aerial services are a proved commercial proposition, and no one can doubt that we are at the threshold of an era of co-ordinated passenger service which will include movement by road, rail and air, and possibly in connection with steamship movements. For freight traffic, air services must necessarily play their part, and if ruinous competition is to be avoided, a co-ordinated service will have to be established.

A century's regulation of railways has been based on the supposition that they are monopolistic in nature and will remain so; to-day no such monopoly exists. Public opinion has been expressed strongly in favour of the elimination of cut-throat competition which is particularly dangerous in the case of transport organisations whether by water, rail, road or air, in view of the large proportion of their charges which are overhead or fixed.

The era of co-ordination and co-operation is beginning to dawn, embracing in its folds all the various forms of world carriers, and it is for the railways, being responsible for the movement of freight traffic in bulk on land, to attempt every available form of co-ordination with other transport organisations. Every success which is achieved in that direction is likely to be described as aimed at obtaining monopoly, but public opinion most certainly frowns heavily upon the only possible alternative of ruinous competition.



Institute of Transport.

The First Ordinary Meeting of the 1929-30 Session of the Institute of Transport was due to take place in the Lecture Theatre of the Institution of Electrical Engineers, London, on October 14th, when Sir Josiah C. Stamp, G.B.E., D.Sc., LL.D., was to be inducted as President by Air Vice-Marshal Sir W. Sefton Brancker, K.C.B., A.F.C., the retiring President, and to deliver his Inaugural Address. As this issue of our Journal was printed before the meeting took place a report of the President's address will appear in our next issue.

Premiums in respect of the Session 1928-29 have been awarded by the Council, as under:—

Institute Triennial Gold Medal.
To Mr. Robert Bell, C.B.E., for his papers on:—
(i). "Trade and transport prospects on the North East Coast."
(ii). "Transport developments in 1928."

Railway (Operating) Gold Medal.
Donor: The Railway Companies Association.
To Brig.-Gen. F. D. Hammond, C.B.E., D.S.O., for his paper on "Some transport problems of the Empire."

Railway (Engineering) Gold Medal.
Donor: The Railway Companies' Association.
To Mr. H. N. Gresley, C.B.E., for his paper on "The Froelich hydraulic wagon brake at March Concentration yard."

Road Transport Gold Medal.
Donor: The Commercial Motor Users' Association.
To Monsieur A. Metral for his paper on "Fuels—alternative or supplementary to petrol for road vehicles fitted with internal combustion engines—Gaseous fuels."

Road Transport Gold Medal.
Donor: The Underground Railways and L.G.O.C. Group.
To Dr. W. R. Ormandy for his paper on "Fuels—alternative or supplementary to petrol for road vehicles fitted with internal combustion engines—Liquid fuels."

Water Transport Gold Medal.
Donor: The Dock and Harbour Authorities' Association.
To Mr. J. F. R. Wiggins, for his thesis on "The labourage policies of port authorities."

Institute Graduate Silver Medal.
To Mr. A. A. Jackson for his essay on "The sphere of the railless trolley vehicle system."

Institute Student Silver Medal.
To Mr. A. F. Chandler for his essay on "The principle of the standard net railway revenue."

"Modern Transport" Premium.
Donor: "Modern Transport."
To Mr. E. Wallis (Graduate) for his essay on "Junction layouts."

Twenty-Five Years of Aviation.

By Air Vice-Marshal Sir W. Sefton Brancker, K.C.B., A.F.C., Director of Civil Aviation.
Immediate Past President, Institute of Transport.

IT is surely a happy augury that *The World's Carriers and Carrying Trades' Review* should have come into existence just a year after the epoch-making flights of the Wright Brothers, which marked the birth of a new form of rapid transport—a form of transport which had been the subject of the dreams of many men for many centuries.

It may be that this fact accounts for the keen and intelligent interest which this periodical has always evinced with regard to commercial aviation.

After the great pioneering feats of the Wrights, the most important event in aviation was the conquest of the English Channel by Louis Bleriot in 1909. This dates the beginning of a rapid expansion both in interest and operation in many parts of the world.

Up to the outbreak of the world war in 1914, civil aviation could claim at least equal importance to military aeronautical activities—and designers and constructors were generally as much interested in the development of touring, sporting and transport aircraft as they were in the production of war aeroplanes.

AIR VICE-MARSHAL SIR W. SEFTON BRANCKER, K.C.B., A.F.C.

Already at the beginning of 1914, concrete schemes for the operation of air transport were being evolved—and it is likely, that if war had not intervened, air transport and air touring would have grown up naturally without any serious financial assistance from the Government.

But the war came and completely upset our sense of proportion regarding the role of aviation in the further progress of civilization.

A huge aircraft industry was developed at high speed; money was poured into it lavishly and extravagantly; safety and economy were forgotten; the main objectives of our national effort were the attainment of greater and greater output in pilots and aircraft and the accomplishment of higher and higher performance regardless of cost.

From August, 1914, to May, 1915 (10 months), our total output of aircraft was about 800, and from January to October, 1918 (10 months), 26,685 aircraft and 29,561 engines were produced in Great Britain alone. One type of fighting aircraft suffered wastage at the rate of 50 per cent. a month.

Naturally, with such experience to go upon, the public, by the end of the war, had forgotten the peaceful activities of aviation, prior to 1914; many, indeed, had never heard of them, and could only visualize aircraft as deadly weapons of destruction demanding dare-devil courage in their operation. Added to this, the experienced personnel released to private life on demobilization and available for civil aviation development, had been trained in the worst possible school for the operation of safe, regular, and economical transport.

It is not to be wondered that the successful pioneer efforts to establish regular air transport between Great Britain and the Continent involved considerable financial losses to the operators.

During 1919 and 1920, practically every civilized nation in the world produced a few pioneers who devoted themselves to air transport. It was apparent to all who made serious estimates of working costs, that the operation of air transport, except in very unusual circumstances, must involve serious financial losses for a number of years. This period of loss was estimated variously at from five to thirty years. It was obviously an unknown quantity depending, on the one hand, on the rate of technical progress made towards the production of really efficient commercial aircraft—and on the other, on the measure of support given to this new means of travel and communication by the general public of all nations.

The three nations who led the van in this pioneering effort were France, Germany and Great Britain —France, because her leaders had the imagination to vizualise the great benefits which would result from quick air communications with her Colonial possessions and with her allies; Germany, because by the terms of the Treaty of Versailles, she was forbidden to construct or possess any military aircraft; and Great Britain, because certain individuals realised that air transport would provide a career of adventure and enterprise with a promise of financial reward in the somewhat distant future.

In actual accomplishment and in regularity and safety, Great Britain led the way for two years; in the measure of Government assistance provided she lagged far behind. The natural outcome was that money ran short; British enterprise was curtailed and in some cases destroyed, whilst those of France and Germany expanded and developed.

In 1921, a definite policy of subsidizing air transport was adopted by the Government — and although various changes of method have occurred since, our progress has been steady, but in measure of operation we are still far behind.

Germany, after an intensive internal development forced on her by Treaty restrictions, has now shaken off these restrictions, and has opened an extensive programme of world wide operations. She has already established herself in South America and in Persia. Her direct subsidies to operations during 1928 totalled £988,480.

France has pursued her original programme unflinchingly and can claim the greatest international air line development in the world, including South America. Her subsidies, including those provided by the Colonies, amounted to £927,200 in 1928.

The United States, after a period of state controlled experiment, have burst forth into an enormous commercial development within her frontiers, and is beginning to establish her national air services to South America. The U.S.A. Government does not subsidize directly her internal air lines, but provides a highly developed ground organisation costing about a million sterling a year without charge to the operator. She grants a subsidy to the principal American Company working towards South America.

Digitized by Google

Austria, Belgium, Denmark, Finland, Holland, Hungary, Italy, Poland, Russia, Sweden, Switzerland, Yugo Slavia, have all developed efficient air services. Perhaps the most remarkable of these are the mountain services of Italy, Austria and Switzerland, and the Colonial services of Belgium and Holland.

In the British Empire, although the volume of our operations is small as compared to our wealth and our vast distances, we can claim the highest standard of regularity, combined with safety and economy.

We have now a clearly defined policy.

Imperial Airways, since April 1st, have operated a weekly service between London and Karachi via France, Switzerland, Italy, Egypt, Palestine, Iraq, and Persia; seven days interesting and comfortable travel by air; one night in the train, and the other nights at Naples, Athens, Tobruk, Gaza, Baghdad and Jask.

The Indian Government are considering plans for carrying this service on from Karachi to Rangoon via Delhi and Calcutta—another 3 days' journey.

The question of establishing connection from Rangoon to Singapore—a link in which the Singapore and Federated Malay States Governments are keenly interested—is under consideration. Australia has already established regular air routes around her continent with terminals at Derby, Perth, Adelaide, Melbourne, Brisbane, Camooweal and Normanton, and is now studying the problem of extending active operations to Singapore, as soon as regular air communication from Singapore to the Home Country is assured. I can see no reason why the through line between London and Melbourne should not be working by the end of 1931.

In the early days, this service will cover the whole distance from London to Melbourne in 17 days, the nights being spent on terra firma.

Prophecy is always a doubtful enterprise, but in my own mind, there is no doubt that, with the introduction of night flying, the improvement of ground organisation, and the increase of cruising speed in commercial aircraft, the journey from London to Melbourne will be accomplished in 179 hours, and that from London to Cape Town in 108 hours.

In Africa matters are progressing. Arrangements have been made for a service from Alexandria to Cape Town via Khartoum, Nairobi, Livingstone, and Johannesburg. The service will work in connection with the Imperial Airways service between London and India and the voyage from Alexandria to Cape Town will occupy nine days. This project is supported generously and financially by the Union of South Africa and by the Colonies, Mandates and Protectorates of the Sudan, Uganda, Kenya, Tanganyika, and Northern Rhodesia. It should commence operation in 1930, and be in full operation to Cape Town in 1931.

In addition to this, our two new airships should be flying almost immediately. Dr. Eckener by his great voyages during the last year has demonstrated to the world the wonderful possibilities of the airship as a trans-oceanic carrier. He would be the first to admit that our two airships, R.100 and R.101, are superior in almost every respect to the "Graf Zeppelin"; his endeavours have been restricted by lack of sufficient shed accommodation and shortage of money, but he has done more for the cause of airships in the last year, than has been accomplished since the double flight of our R34 to New York and back in 1919. Our first programme for the operation of these new ships is not yet decided; but Canada has provided a fine air-port in Montreal and facilities for landing and housing exist at Ismailia and Karachi. It therefore seems certain that experimental flights between Cardington and Montreal will be one of our first activities and that one ship will work on the Eastern route with a view to obtaining data regarding the operation of airships under tropical conditions concerning which no one, outside the U.S.A., has any knowledge whatever.

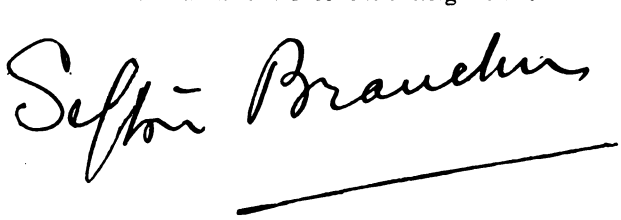
Personally, I believe that the airship will be our mainstay for cross-oceanic operation for 20 or 30 years to come, but that meanwhile the big flying boat will be developed as the most potent factor in long-distance world-wide air transport.

Already Dr. Dornier has produced a boat propelled with a total power of 6,000 horse power, and approved for a total weight of 52 tons; this great aircraft handles easily and safely, rises from the water rapidly and cruises at a high speed. Its appearance marks the beginning of a new era in air transport, but it cannot yet compete with the airship in long-distance non-stop flights.

It is useless for me to reiterate the enormous possibilities of air transport in the future.

The quality of high speed and the power to operate *direct* between any two points on the globe must definitely overshadow the passing disadvantages of high cost and dependency on weather conditions.

Air Transport in Europe is already one of the most important factors in the development of friendship and understanding between the various nations with their conflicting interests; its power in this direction in the future must be incalculable, and meanwhile it must inevitably assist in the general increase of prosperity and the development of international trade in those countries which are fortunate enough to develop their national air transport on sound lines, or to attract to their airports, the commercial aircraft of their neighbours.



Institute of the Motor Trade.—The Eighth Examination of the Institute of the Motor Trade will be held in London and Provincial Centres on 29th November next, commencing at 10 a.m. The Council are offering Gold, Silver and Bronze Medals for the three Candidates securing the highest number of marks in the 1929 Examinations (April and November). Candidates desirous of presenting themselves must give notice to the Secretary on or before the 1st November, 1929. Full particulars and Entry Forms can be obtained on application to the Secretary, The Institute of the Motor Trade (Inc.) 157 Great Portland Street, London, W.1.

The Institution of Automobile Engineers.—The opening meeting of the Session of The Institution of Automobile Engineers was held in the Great Gallery of the Royal Automobile Club, Pall Mall, S.W.1, on 1st October last, when Professor W. Morgan, of Bristol University, delivered his Presidential Address entitled "The Member and the Institution." The Address dealt with a number of matters of importance to automobile engineers in the exercise of their profession and the manner in which the Institution can assist them. The address of the Institution is Watergate House, York Buildings, Adelphi, London, W.C.2.

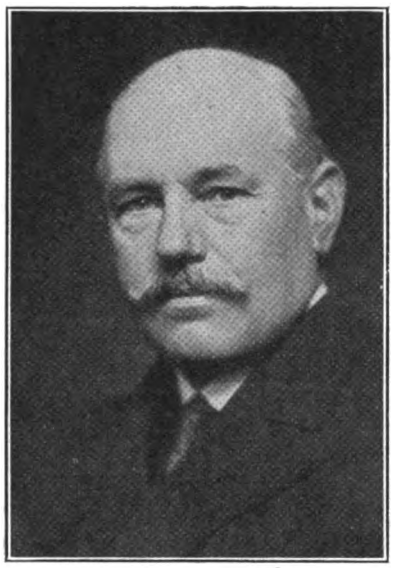
Twenty-Five Years of Motor Transport.

By J. Maughfling.

Director, John I. Thornycroft & Co., Limited; President, Society of Motor Manufacturers & Traders.

WHEN this Journal was established in the year 1904, Motor Transport was in the early stages of its development, users were few and far between, and the manufacturer sufficiently optimistic to undertake the production of motor vehicles was compelled, at considerable expense, to educate the purchaser, and his often unsympathetic staff with experience of horse transport, in the use and care of the motor vehicle generally. Gateways, works entrances and bridges were exceptionally narrow or the latter unable to stand the necessary weight; goods of every sort and description must be carried in exactly the same way as with horse transport and, in short, there was no thought of altering conditions to suit the new method of transport. Instead, the motor vehicle was expected to be constructed to meet all these exceptional conditions.



MR. J. MAUGHFLING.

Many of these troubles have been eliminated now that it is recognised that the Motor Vehicle is an absolute necessity as a transport unit, and it is realised that suitable roads, bridges, works entrances, loading bays, etc., must be provided.

One of these early conditions still exists and, it appears, must continue to exist for all time. It arises from the fact that every different and distinct trade using motor transport is faced with special circumstances as to the carriage of its goods, which may be liquid, solid, light, heavy, perishable, inflammable, specially liable to leakage, or differ very materially in size and length of the unit.

In addition to providing for the foregoing special conditions it is found that the user of any considerable fleet of vehicles (and there are now a great many of such cases), has standardised on certain fittings and accessories or tyres. He will require a special type of body to suit his trade and, as regards the chassis, his requirements may call for high or low speed, high or low frame, short or long wheelbase, normal or forward control, exceptional springing, and storage for fuel, and many other variations which need not be detailed.

Admittedly these conditions may not apply to the light type of commercial vehicle, but they do exist generally throughout the trade and, for this reason, it would seem that there never can be mass production in the manufacture of commercial vehicles in the form in which it has been adopted in the private motor car trade.

To be successful, the manufacturer of commercial vehicles must be prepared to meet the conditions stated above. It means, amongst other things, special and individual attention to each job, necessitating an expensive management staff and drawing office, the carrying of stock disproportionally large as compared with output, the maintenance and running of a considerable fleet of trial vehicles, and the application of the utmost energy and push on the part of the manufacturer to ensure the execution of the orders on his books within a reasonable time.

Having set out the circumstances under which the manufacturers are working, and it seems must continue to work, it is perhaps appropriate to say something on the question of price. Worked out on gold basis the current prices of commercial vehicles are 38 per cent. below the pre-war level. Set against this the fact that the Index of wholesale price of materials is 35 per cent. above pre-war level and the earnings of the workpeople employed 83 per cent. above pre-war level, and it will be realised that the commercial vehicle manufacturer has made a remarkable effort towards the cheapening of transport generally by improvements in design and increased efficiency in his workshops.

This considerable effort has been a costly matter to the manufacturers but it has immensely benefited the transport system of the country. It has forced other forms of transport into an effort to improve and bring their methods up-to-date, and we are now at the stage of witnessing most interesting developments. Whatever may be the results, it is abundantly clear that motor transport will increase and develop and continue to improve in the coming years.

Road Vehicles Lighting Regulations.—The Minister of Transport has made the Road Vehicles Lighting Regulations, 1929, dated 29th August, under the Road Transport Lighting Act, 1927. The new Regulations, which will come into force on the 1st November next, supersede the Road Vehicles Lighting Regulations, 1928. The new Regulations re-enact the provisions of the old Regulations with the exception of Regulation 6 in which wider discretionary powers are conferred upon Chief Officers of Police in regard to the exemption of motor vehicles in parking places from the requirements of the Lighting Act and Regulations.

Royal Commission on Transport.—The Chairman of the Royal Commission on Transport announces that following upon their appointments as Under Secretary of State for Air and Parliamentary Secretary to the Board of Trade respectively, Mr. Frederick Montague, M.P., and Mr. Walter R. Smith, M.P., have tendered their resignations as Members of the Royal Commission on Transport, which His Majesty has been pleased to accept. His Majesty has been pleased to appoint Mr. William Leach, M.P., and Mr. Frank Wallis Galton to fill the vacancies thereby created.

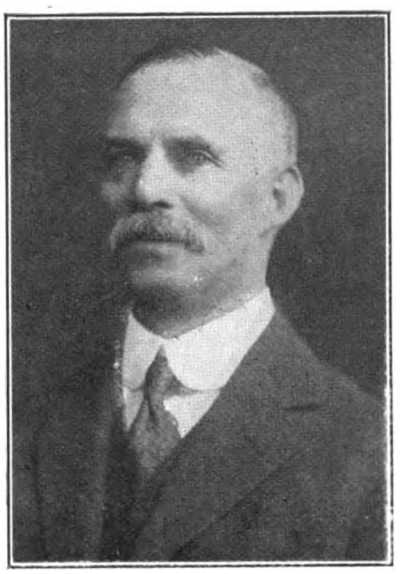
Twenty-Five Years of Shipping and Forwarding.

By M. E. Duffett,

President, London Shipping and Forwarding Agents' Conference; Vice-President, British Association of Shipping and Forwarding Agents.

FIRST of all let me congratulate you on the celebration of the 25th Birthday of *The World's Carriers*. You know better than I the exceptional advance which you, as Editor, have made in the very successful development of a Journal devoted to the interests of all classes of transport, and it is quite superfluous to mention the intensive manner in which all the changes which have come about during the last quarter of a century have been catered for, and in some cases initiated, by your consistent and close touch in all matters connected therewith.

When I look back over the last 25 years in connection with the Shipping and Forwarding interests, and think of the changes which have come about, I am somewhat surprised and feel as one always does, how much one could have done if the power of looking into the future had been possible. Twenty-five years ago the London Shipping and Forwarding Agents' Conference, although it had then existed for seven years, was not the power it is now. It then consisted of only a few firms who had the foresight to see that if they were to maintain their position in the trade, they would have to have some means of collective action if need arose. Apart from this there was the necessity to remove what then existed to a very large extent, which was a jealousy and suspicion, a species of internicene warfare, between the various firms who were interested in the same trade. It was a very tough and uphill fight for a number of years to arrive at any condition of cohesion between members who were always inclined to sit on the fence for fear a rival might do something antagonistic to them, but as time went on this was gradually improved until now we find it easy to bring into active collaboration firms who have previously refused to have anything to do with each other.



MR. M. E. DUFFETT.

The number of members of the Conference has increased to such an extent that we are now approaching 100 strong. In the early days the Conference was almost unknown to the Steamship Companies, Railway Companies, Port Authorities and others, but now it is welcomed by all of them as a means of ventilating any grievances on either side, and serves the useful purpose of assisting to arrive at a solution of difficulties which from time to time are bound to arise.

Amongst other changes there has been that of amalgamation of interests in every direction and the continued growth of trade associations, without which nothing can be accomplished in these latter days. Merchants and others no longer plough their own lonely furrow, but find it a necessity to work hand and glove with their own competitors.

As a result of the efforts of the London Conference there has been evolved the British Association of Shipping and Forwarding Agents, which comprises Forwarding Agents from all parts of this country, and this Association serves a very useful purpose in dealing with matters which concern the whole trade, and which apply to the whole of the Ports in the Kingdom, but which do not in any way affect the domestic affairs and local arrangements of London, Liverpool, Glasgow, Manchester, Hull or other Ports where there may be local Associations.

Another advance has been the close collaboration with the European Forwarding Agents' Association which comprises the Forwarding Agents of the whole of the Continent of Europe. This also applies to the Forwarding Agents of America, particularly the Freight Forwarders' Association of New York, who, in conjunction with us, have been able to do good work for the benefit of Forwarding Agents in general. Who could have foreseen 25 years ago the rapid advance in aviation, road transport and development of steamers. In the air we have now reached a stage where fast traffic, both passenger and goods, goes by air, and the rapid development on the road is doing much to stimulate the efforts of the Railways. As to Steamers, the advance in speed has had the effect of revolutionising, in many respects, the routine of shipping goods. The Forwarding Agent 25 years ago, when the telephone was young—the typewriter was undeveloped, and the numerous artificial aids which are now necessities were looked upon as novelties—had a difficult time, but it was nothing compared with the stress and rush of these days. In the old days when the Customs Duty on goods was limited to a few articles, the Forwarding Agent's Custom Department was a small affair. A mighty change has now come over the scene and the present day Forwarding Agent has to maintain a Staff of highly technical and expert Customs Clerks to deal with the various intricate Customs' formalities in connection therewith. Whether the future will bring about the Licensing of Custom House Agents by H.M. Customs, as was the case in earlier times, is a matter which will require consideration in the future in the interests not only of the Government but also for the safeguarding of the importers.

The London Shipping and Forwarding Agents' Conference is of sufficient importance and has to deal with so many questions that it has been found necessary to form separate sections to deal with the various trades, and this has resulted in many advantages.

The Forwarding and Shipping business is no longer one which can be conducted by anyone with a limited amount of experience, but has become so highly specialised a branch of transport that it can only be carried on satisfactorily by a well established concern with long experience of the necessities of traders.

Having acted first of all as Secretary, and then for many years as Chairman and President, I have had exceptional opportunities of knowing the inner history of the trade, and I look forward with faith to the future of our profession.

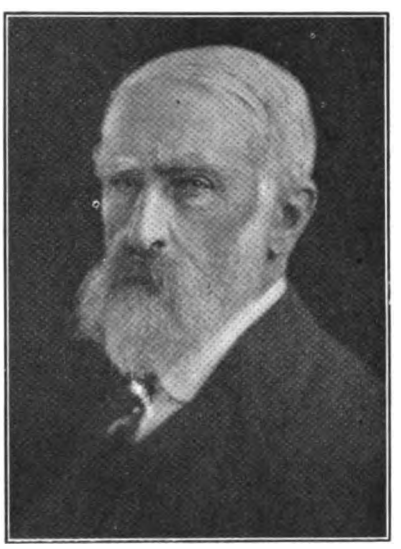
Transport by Canal.

By R. Fane de Salis, B.A., F.G.S.
President, Canal Association.

The canal industry, sometimes regarded as obsolescent, is really of such national importance, as the third largest carrying agency in the country, that a few figures may not be out of place. There are in Great Britain nearly 4,000 miles of canals and navigable rivers owned by railways, private companies and public bodies, carrying some 25,000,000 tons of traffic yearly. According to returns issued by the Ministry of Transport for the year 1927 the five principal items originating on canals were :— Coal, 7,066,400 tons; building materials, 1,601,386 tons; raw materials, 1,594,549 tons; industrial products, 1,498,298 tons; agricultural produce and foodstuffs, 1,455,286 tons. The above figures do not include the Manchester Ship Canal.

Owing to the canal building era having preceded railways by some fifty years, certain routes and branches to small towns have necessarily ceased to be serious competitors under modern traffic conditions, examples are the Basingstoke Canal, which was originally intended to carry on over the downs to Southampton, and the Kennet and Avon Canal, from the Thames at Reading to Bristol, in this case modern sea and rail transport is more efficient. On the other hand, we find certain canals carrying a large specialised traffic successfully in competition with road and rail :—The Aire and Calder, coal to the port of Hull. The Trent and Mersey, the products of the china factories in the Stoke district for shipment, and flints and china clay from France and Cornwall to the factories, the raw materials of the china industry. The Grand Union with its access to the Port of London at Brentford and the Regent's Dock, bringing in coal, timber, grain and flour, strawboards, tea, cocoanut oil, etc., ex ship, and with factories established along its banks, and availing themselves of both rail and water transport with the added advantage of the use of canal water for condensing and cooling purposes.



MR. R. FANE DE SALIS, B.A., F.G.S.

Although the era of canal construction, other than ship canals, is probably over—the last to be constructed was the Slough Canal about the year 1880, a branch of the Grand Junction Canal from West Drayton to Slough—improvements are being constantly made to enable canals to meet modern transport requirements. The increasing use of motor traction, which is gradually superseding horse traction, and may itself in time be rendered obsolete by electric traction, calls for better bank protection than sufficed for the horse-drawn boat.

Owing to the use of efficient modern dredging plant and good maintenance, while the size of boats is regulated by lock dimensions, they are able to carry an increased load, reducing cost of haulage. Bridges built a hundred years ago to suit the traffic of that time, and quite unfit to carry modern loads, or to pass traffic safely, are being steadily replaced, and under the Bridges Bill of last Session more rapid progress may be anticipated. The companies themselves, or in conjunction with their traders, are improving warehousing and installing mechanical means of loading and unloading. On certain routes it may be advantageous to construct new locks, or lifts, to enable a pair of boats of 7 ft. beam, or a boat of 14 ft. beam, carrying about 80 tons to pass, effecting a considerable saving in the cost of transit. Improvements necessarily cost money, which would clearly not be remunerative for some time.

Probably some companies will find it to their advantage to avail themselves of the Government scheme to enable them to raise funds free of interest for a period of years. Development Bill (Loan Guarantees and Grants). A deputation from the Canal Association on this subject was recently very favourably received by Mr. Morrison, the Minister of Transport.

Canals, owing to the early date and haphazard way in which they were constructed, suffer under great disabilities. Thirty-three companies, including four railway companies, own 2,475 miles, the remainder consisting of navigable rivers and drainage areas being chiefly controlled by fifty-one public bodies. The Royal Commission of 1906 came to the conclusion that the first essential to progress was the unification of ownership. This seems obvious, and the first step in this direction was taken last year by the amalgamation of the Regent's, Grand Junction, Warwick and Napton, and Warwick and Birmingham Canals. The Grand Junction Canal had many years ago purchased the Grand Union and Old Union Canals, giving access to Leicester, so that now the Grand Union Canal, the name taken by the combined group, own the whole route between London, Leicester and Birmingham, a length of about 250 miles. Further amalgamations could take place with advantage, but as the old canal companies are statutory and not limited liability companies, an Act of Parliament is required to obtain any fresh powers, whether to raise money or for the simplest amalgamation scheme. Not only has the cost of this to be met, but the heavy stamp duties exacted by the Treasury on company amalgamations, which were waived in the case of the railway amalgamations in 1921, have to be paid. The time is ripe for the encouragement of a form of transport which can do much to relieve both road and rail of traffic for which they are not so well suited.

Combined motor and canal transport may well play its part in developing transport by water. Certain firms of carriers now use motor transport for collection and delivery to canal wharves, and it may be that canal companies in the future will find it economical to work their own fleets of lorries.

In this article I have thought it as well not to touch on the question of the reconstruction of canals to a 100 tons or larger standard, because this could only be considered if the State, or a public trust, were to take them over. As commercial concerns, any improvements considered must be such as have a reasonable prospect of being profitable. In the case of public ownership a direct profit may not be the determining factor.

R. Fane D. Salis

What Road Motor Transport means to the Man in the Street.

By Geo. Monro, C.B.E., M.Inst.T.

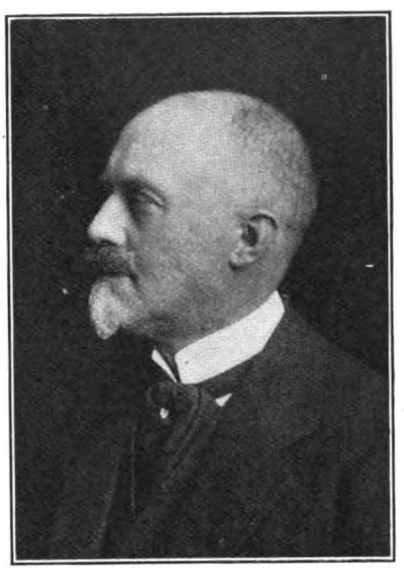
President, The Commercial Motor Users' Association (Inc.).

It is doubtful whether the average "man in the street" fully appreciates the extraordinary advance which has been made in the road motor transportation system of the country during the present century, or the extent to which the operation of commercial motor vehicles function towards the common good and the prosperity of the nation.

Development.

When one realises that there were less than 3,000 commercial motors on the highways of the country when the first number of *The World's Carriers* was published on the 15th October, 1904, as compared with more than 400,000 such vehicles in regular use to-day, one can form some slight conception of the marked progress of road motor transport in the comparatively short period of a quarter of a century.

This development has been so rapid that, whilst not wishing to enter into the realms of prophecy, I feel on safe grounds in suggesting that before very long the number of commercial motor vehicles in use in Great Britain will be in excess of 500,000, the number of employees engaged in the industry (which now exceeds 800,000) will be more than one million, and the amount of direct motor taxation contributed by the owners of these vehicles, which is now over £10,000,000, will exceed £15,000,000, figures which I venture to assert entitle the road motor transport industry to rank amongst the great industries of the country.



MR. GEO. MONRO, C.B.E., M.INST.T.

Goods Transport.

Road motor transport enters into so many activities of the community that it is difficult to single out any one in which the commercial motor vehicle does not play a part—in many cases an important and even fundamental part. It is often not realised what an important part road transport does play in the industrial life of the country. In fact, the scope of the commercial motor to-day may be said to be almost unlimited, for there are few industries in which motor haulage cannot be employed with advantage. Millers, brewers, quarry owners, collieries, building contractors, drapers, grocers, cotton and woollen manufacturers, and so on, all take advantage of the facilities afforded by road transport.

For instance, when cotton arrives at the port as a raw material it is taken to the spinning mills where it is made into thread or yarn; then to the manufacturers of the cloth, and from there to the finishing works to be bleached or printed; then on to the wholesaler and the retailer and finally to the public. In all these stages commercial motor vehicles are frequently employed. Again, to take the great industry with which I am more intimately concerned, *viz.*, agriculture, road motor transport has enabled the farmer to carry to the market his livestock, poultry, corn, hay and market garden produce of all kinds, and to take back to his farm the various goods which he requires for his own use.

These instances are merely chosen as being typical of the uses to which road motor vehicles are now put, and I am convinced that we are on the threshold of even greater developments.

Passenger Transport.

So far as the "man in the street" is concerned, the passenger side of the industry is perhaps the one which makes the most direct appeal to him. In the early days of the movement many of the smaller towns and villages were practically isolated, the only means of communication between them and the railway or neighbouring places being by slow horsed-vehicles, and one result of this lack of adequate transport facilities was that no small difficulty was experienced in making close contact between town and country. The development of this side of the industry has conferred many advantages upon individual members of the community. It has enabled the town worker to reside further and further from large towns, with resultant improvement to health, and has brought the shopping amenities of the towns to the doors of those who live in villages. It has also provided a means for those who do not own their own motor cars to enjoy the beauty of the countryside.

A Tribute to "The World's Carriers."

I have witnessed the growth of the road motor transport industry from its earliest days, and I am making this small contribution as a tribute to the success which *The World's Carriers* has achieved during the twenty-five years of its existence. The guiding principle in its policy has at all times been the advancement of road transport, and in acknowledging the service which it has already rendered towards the progress of the industry I can only hope that when it comes to celebrate its jubilee its record of usefulness during the second quarter of a century of its publication will be even more marked than in the past.

Geo. Monro.

Twenty-Five Years of Transport by Road.

By P. R. Turner.

President, London Cartage and Haulage Contractors' Association.

So far as transport is concerned what a wonderful vista of change and development a retrospect of the last twenty-five years produces. In any sphere of transport this is manifest, but in none more so than in the transport of goods by road.

Twenty-five years ago this form of transport operated in very restricted areas, the horse being the only motive unit. The industry and ingenuity of men, however, produced two new factors which ultimately influenced the great transition from town cartage to road transport as we know it to-day. These were the invention and perfection of the internal combustion engine and the great improvement in the building of roads.

Where the delivery of goods by road was restricted to a few miles, the new factors have now so altered conditions that no restriction exists throughout the length and breadth of the land. Traders were not slow to avail themselves of the new facilities offered, and consequently the vehicles now trading on the roads of the country number hundreds of thousands.

MR. P. R. TURNER.

Together with the petrol motor, steam and electrically driven vehicles have developed, but not to the same extent, and the internal combustion engine is at present paramount in this field.

The first steam wagons were of little utility, and it was not until 1910 that they were seriously considered and used by the road transport industry. Prior to this date, the petrol vehicle was also little used, as it proved expensive and unreliable. The process of perfecting, however, went on rapidly and just prior to the Great War made a great advance. The large proportion of dead load carried by steam and electric vehicles has hindered them in the race, and because of its proportionally widened, with the most beneficial results for the ahead. It has made enormous strides, and to-day the great six and eight-wheelers are a common sight on the roads. Indeed, its potentialities both as to speed and to carrying capacity seem practically unlimited and are only kept in check by the restrictions of the Law. The natural prejudice in the trade for the horse gradually gave way before the new factors, and the field of activity continually widened, with the most beneficial results for the trade of the country.

The first motor vehicle appeared on the roads of this country about 1895, and in order to meet the demand for the removal of restrictions, such as the necessity of carrying a red flag in front of a mechanically propelled vehicle, the Locomotive and Highways Act was passed in 1896, followed by the Locomotives Act of 1898. Further development was followed by the Motor Car Act of 1903, and a system of motor registration was then set up. Another Order known as the Heavy Motor Car Order followed in 1904, which fixed the speed for heavy motors and trailers.

Up to the year 1909 motor vehicles paid an ordinary carriage tax of two guineas per annum, up to one ton unladen weight. Four guineas from one to two tons, and seven guineas over two tons. In the year 1909 a new scale was introduced, based on horse power, and also a petrol tax of threepence per gallon, the proceeds of these taxes being specifically earmarked for the improvement of roads. Subsequently, in 1920, the petrol tax was abolished and a greatly increased scale of taxation imposed on motor vehicles. Additional taxes were made in 1926, and to add insult to serious injury a petrol tax of 4d. per gallon was again levied in 1928.

The later heavy additions of taxation can be directly attributed to the activities of the Railway Companies, who were becoming alarmed at the rapid strides road transport was making. It had been thought for some years that the new form of transport would prove supplementary to rail transport and that as time passed each would find its own sphere in the national economy without detriment to the other.

The general evidence up to 1920 certainly supported this idea, but the rapid expansion of road transport over ever greater distances, offering new facilities to traders, proved road transport to be a serious and successful competitor of the railways.

The greatest impetus to motor transport came immediately after the close of the Great War, when the ports and railway depots of the country were congested with goods and unable to deal with traffic expeditiously. Traders, therefore, availed themselves of the alternative means at their disposal. The following years showed a steady increase in the number of road vehicles in use, and finally led to the railways asking Parliament for sanction to acquire interests on the road. After some abortive attempts by separate railway companies, Bills promoted jointly by the whole of the railways became law in 1928.

It is yet too early to say what effect these Bills will have on the road transport industry, but the railways have already been active in acquiring interests in several large passenger-carrying undertakings. The goods-carrying side of the industry presents a very difficult problem, as it is made up of a very large number of small units and is open to participation by all.

Twenty-five years ago road transport was comparatively insignificant, but to-day it is of the utmost importance to the State, directly employing several hundred thousand men, and indirectly many thousands more. The horse was supreme then, and while it still plays its part to-day in docks, congested areas and on very short hauls, it has to play "second fiddle" to its mechanical cousin.

Twenty-five years ago the sponsors of *The World's Carriers* were bold men who lived on hope, but to-day they are the servants, mentors and scribes of an enormous industry. *The World's Carriers* serves a most useful purpose in recording the history of the trade, in expressing the views of its leading members and often in guiding thought in the industry into right channels.

Public Road Passenger Transport, 1904-1929.

By Frank Pick.
Managing Director, London General Omnibus Co., Ltd.; Chairman, Omnibus Owners' Association.

Twenty-five years cover almost the whole history of motor vehicles employed in public passenger transport on the roads. With the emancipation of the power driven vehicle in 1896, the development of large passenger carrying vehicles was slow. The first petrol-driven omnibus went into service in 1900, followed by a steam-driven omnibus in 1902. They were short-lived, a constant succession of experimental vehicles following each other until about 1905. In 1904 there were only 31 omnibuses licensed in Greater London by 1906 there were 464, and in the interval what had been a novelty had become accepted practice. Yet London cannot claim the honour of the first regular motor omnibus service, for this it would appear belongs to the County of Cornwall, the Great Western Railway starting its service between Helston and the Lizard in 1903. Or taking the country at large, though accurate estimates are hard to come by, there were about 75 motor omnibuses at work in 1904 and over 1,000 in 1906. Meanwhile, the horsed vehicles were steadily dwindling in numbers, the last horsed omnibus in London passing out in 1911, so that by 1912 the motor omnibus and motor coach had the field to themselves. At the close of 1928, according to the latest returns of the Ministry of Transport, there were about 26,000 in service. Thus in this short period of twenty-five years from small beginnings a substantial industry has been built up, which must now provide services amounting to 750 millions of car miles and carrying upwards of 5,000 millions of passengers in a year.

MR. FRANK PICK.

The history of the industry falls into three phases. There was the steady growth that preceded the war of 1914-1918. The record was marred by the numerous accidents attendant upon the introduction to the roads of relatively fast vehicles to which people were largely unaccustomed. The record was also marred perhaps by ill-advised regulations as to use and construction which straightened progress along particular channels. The need for the revision of these regulations had become apparent, and the need for regulation in fresh directions had become acute before the war. Then came the war, and so far as civil users were concerned, all progress was stayed, though military requirements led to considerable advancement in design and reliability. Even after the conclusion of the war, it was almost two years before any substantial activity was apparent. So the post-war phase is reached and for ten years there is its extraordinary record of expansion and promise. The motor coach running regular excursions had made its appearance tentatively about 1912, but it was not until after the war that the running of these vehicles upon long distance excursions became such a noteworthy feature, growing in London to such a pitch that in 1929 there were not less than 750 time-tabled departures on an ordinary week-day to the coast and the country.

The demobilization of soldiers, who had learnt how to handle mechanical transport in the field, with satisfactory gratuities in their possession which they wished to apply in providing themselves with an outdoor, active livelihood, led to a quite reckless multiplication of road transport facilities. This in its turn depleted the passengers of the railways and at the same time built up an entirely new passenger traffic, thus creating a fresh social problem not easy to resolve and harmonise. The war was almost transferred to the roads, and there were casualties and alliances which served to straighten matters out a little. Yet the underlying confusion remained, and transport at times and in places was more a commercial speculation than a public service. Departmental Committees of the Ministry of Transport reviewed the situation and submitted recommendations for its amendment which are still a dead letter. These same committees reviewed also the whole scope and character of the regulations governing the licensing, construction and use of public service vehicles, but except for some urgent adjustments, once more effective action has not been taken, and at this time the whole matter stands referred to the Royal Commission on Transport.

Yet it must be admitted that the post-war omnibus, introduced from 1920 onwards, was a marked advance upon the pre-war omnibus. If the main features must be noted they were the increase in size and in power, the forward position of the driver, the low loading platform, which eventually permitted the covered top and the adoption of pneumatic tyres.

All this while the need for some measure of control in the public interest was recognised in every quarter, but except for the London Traffic Area nothing was done. The railways, with traffics abstracted from them in all directions, sought, and obtained in 1928, powers to join in the scramble for road traffic, powers which they have employed to establish themselves in effect as the dominant partners in substantial road passenger transport undertakings. So the year 1929 finds road passenger transport still in an unstable and undefined condition. In fact, this form of passenger transport has reached a crisis in its career without attracting such measure of public support and attention as might ensure it a fair and equitable settlement. For somehow road transport has not at the moment too many friends.

During the whole of this period there were in existence associations of motor omnibus proprietors charged with the task of watching and defending motor omnibus interests, and in 1917 an amalgamation of the two largest bodies gave to the industry an effective organisation for its protection. The Omnibus Owners' Association has in its brief life taken an active part in many ways in trying to establish its industry upon sound lines, having regard to the public good as well as private enterprise. It has been represented on nearly all Government enquiries and has assisted with its experience and advice in framing what policy there is. It has opposed, not unsuccessfully, those who cut across what it thought to be right policy. But all its actions have been necessarily critical and destructive. It cannot rest with such a body to be constructive. That is the function of those who exercise the right of regulation

Digitized by Google

and control, primarily the Government, and secondarily the Licensing Authorities. This body, therefore, cannot bear the blame for the lack of coherence and consistency which besets passenger transport on the roads.

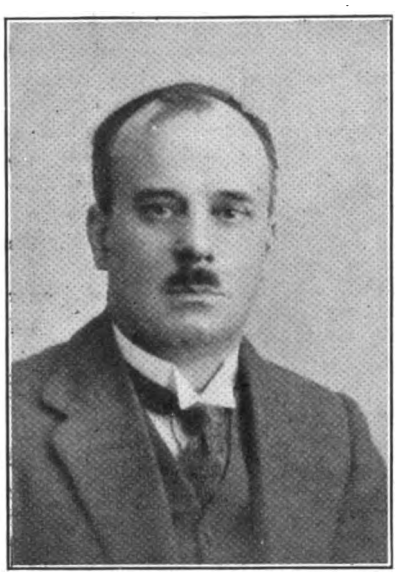
In the prevailing troubles what is most needed is a well considered statement of the national policy with regard to roads and road traffic, framed from a broad unselfish view of the whole traffic problem of the country. For what are the roads being improved and extended? Is there to be an independent road traffic? Is free and unqualified competition to be preferred to co-ordination? What purpose is served by regulation and how far do the present regulations serve any such purpose? Are the burdens thrown upon road transport equitable in their amount and incidence? If road transport at home were examined dispassionately, the answers to some of these questions would be rather surprising. If road transport at home were compared with road transport abroad, some of the disquieting answers would be amply and emphatically confirmed. Road passenger transport is not receiving the consideration and attention it deserves. It is being regarded as subsidiary to other forms of transport, resulting in a false perspective.

So on this twenty-fifth birthday of *The World's Carriers* the occasion seems fitting to make an appeal through its columns, knowing that for all these years it has been labouring in the cause of transport in the most liberal and generous sense.

Congratulations from G. C. Horton.

Chairman, Liverpool Shipping and Forwarding Agents' Association.

It was with much interest that I learned of the special edition you are publishing to celebrate the twenty-fifth anniversary of your useful and interesting review.



MR. G. C. HORTON.

During that period there have been enormous advances in methods of transportation, and it is very doubtful whether any future twenty-five years will witness such important changes.

Your review has always kept well to the front in dealing with these changes and transportation in general, to the great benefit of your readers.

I think I am right in stating that your paper fills a unique position in transportation affairs and, whilst it is stated that we are a nation of shopkeepers, transportation plays a leading part in the Nation's life.

I take the opportunity to express my personal appreciation of your Review; also of the great interest shown by you at all times in matters concerning transportation in general and Shipping and Forwarding Agents' Associations in particular.

With sincere wishes for your continued prosperity.

National "Safety First" Association.

The September issue of "Safety First," the quarterly journal of the National "Safety First" Association, makes very interesting reading. It is announced that the Association's Road Safety Congress this year takes the form of a special session at the Public Works, Roads and Transport Congress and Exhibition, and will be held in the Royal Agricultural Hall, London, at 2.30 p.m. on Monday, 18th November. The Chair will be taken by the Rt. Hon. Viscount Brentford, of Newick, President of the Association, and County Alderman G. Marlow Reed, J.P. (Vice-Chairman of the Middlesex County Council) will give a Paper on "Local Authorities and the 'Safety First' Movement." An interesting article in the September issue of the Association's journal is contributed by Sir Herbert Austin, K.B.E., who writes on "Building Safety into Motor Vehicles." Signal lights in place of a policeman on point duty to control the movement of traffic, particularly at cross roads, have been extensively used abroad, chiefly in America and Germany, and the system is coming more and more into use in this country. Full particulars in regard to the siting and interpretation, etc., of the signals are given in an article on "Automatic Signal Lights for the Control of Street Traffic." The recently issued Report of the Royal Commission on Transport which emphasised the value of the work of the Association is referred to. The following is an extract from the Report:—"The most hopeful method of inducing pedestrians to exercise greater caution is by means of education and propaganda. This is being carried out with marked success by the National 'Safety First' Association, of whose work we cannot speak too highly. In our opinion the Association should receive much greater recognition and support." Articles on industrial accident prevention and safety organisation are given, dealing with the value and display of posters; securing results; the value of Safety Committees and the suggested rules therefor; "Safety First" as a factor in costing; and "First Aid" as a factor in Safety, etc. The address of the National "Safety First" Association is 119 Victoria Street, London, S.W.1. Lt.-Col. J. A. A. Pickard, D.S.O. is the General Secretary.

Modern Ports and the Transport Industry.

By D. J. Owen.
General Manager, Port of London Authority.

Primitive man's first means of water transport was a crude form of craft, but he managed to navigate inland waterways and even ventured some distance on the high seas. Increasing skill in the building of boats and ships enabled him to cross the oceans and establish the foundations of international trade. Present day civilisation is dependent upon the continuance of international intercourse.

The small ships with shallow draught of the earliest days required very little in the way of artificial facilities for their loading and unloading. As time went on, it became necessary to provide small piers or platforms of timber or stone at which the vessels could lie or discharge their inward cargoes and load goods to be taken away. These facilities were increased gradually to meet new conditions consequent upon increasing trade and the growth in the size of ships. Eventually, the latter factor led to the concentration of shipping at different points on the coast and on the banks of deep rivers possessing suitable conditions.

MR. D. J. OWEN.

Thus the situation of most of the great ports of the present day was, in the first instance, determined by the natural facilities they possessed for the safe harbourage of vessels of considerable draught. In more recent times the persistent increase in the size and draught of vessels necessitated the carrying out of great engineering works to supplement the provisions of nature, and there came into being the dock systems which now exist at most of our ports.

The History of the Port of London is an excellent example of this general evolutionary process. Up to the end of the tenth century the growing requirements of trade had been provided for more or less satisfactorily by the erection from time to time of wharves on the riverside. The limitation of space in the river then brought about congestion, delay and other evils, with damaging results to trade, and the very early days of the nineteenth century saw the commencement of the construction of the great dock systems which are so essential for the port's present vast traffic and trade.

It has been said of the transport industry generally that it is "the key industry without which hardly any other industry can flourish," and the importance of efficient transport for goods and passengers in the economic chain of international trade cannot be overrated. Ever since the British people became a maritime nation the ports of this country have been all important to its prosperity. As the result of intensive improvement and equipment schemes carried out during the past few years at London and all the great ports, it can be stated that they now possess adequate accommodation and efficient equipment to deal expeditiously and economically not only with existing trade but also a greatly increased volume of traffic.

Those responsible for the administration of our ports will be grateful to *The World's Carriers and Carrying Trades' Review* for the service it renders by the dissemination of information which keeps them in touch with all branches of the transport industry and the changing requirements of trade. The Journal is to be congratulated upon its record during the past quarter of a century.

British Empire Trade Exhibition, Buenos Aires, 1931.

The British Empire Trade Exhibition in Buenos Aires, organised by the British Chamber of Commerce in Argentina, is to be held for six weeks during February, March and April, 1931, and will be the first of its kind ever held in South America. Anglo-Argentine interests, both at home and abroad, have given the Exhibition their strong support, and, in addition, have subscribed substantial guarantees. It is of great importance to Great Britain that she should maintain her position and trade in South America, and the object of the Exhibition is to place British trade with Argentina more on a par with British purchases and investments there; to demonstrate not only to Argentina, but also to all South America, that British initiative, British goods, and British salesmanship, backed by British credit, so far from declining are preparing to reach higher levels than ever before. All communications regarding the Exhibition should be addressed to the General Manager, British Empire Trade Exhibition, Buenos Aires, 1931, 5 Parliament Mansions, Orchard Street, London, S.W.1, or, locally, to the Exhibition offices at Calle Reconquista 46, Buenos Aires.

Twenty-Five Years of Road Transport !

Looking Backward.

(Specially Contributed by a Pioneer).

THE twenty-fifth anniversary of the publication of *The World's Carriers,* reminds me that it is a little more than twenty-five years since I, with the confidence of youth, entered the road transport industry, my rolling stock consisting of four steam wagons and four trailers. To look back so many years makes me feel old, nevertheless, I feel far younger than I did in those several harrowing years in which I endeavoured to earn a livelihood as a motor haulage contractor. I was a pioneer, but by no means the only one—there were several others, but I do not know of one who made his business a success. One business, it is true, still bears the original name, but the owners of the name have long since ceased their connection with the business. Haulage contractors of to-day will wonder why, there being practically no competition twenty-five years ago, and no price cutting, haulage contracting should not have been an assured success. The reason why it was not a success is easily explained. It is true there was little or no competition as far as motor transport was concerned, but there was price cutting enough, too much in fact for any of us. We were in direct competition with horse transport contractors, an organised trade at that time even, whilst we of the motor haulage industry were interlopers, and every man's hand was against us. We were competing largely with horse transport and the radius of action of our vehicles was very little greater than that of horse vehicles of equal capacity, our capacity being about 3-tons, and we generally overloaded an additional ton in frantic endeavour to get a bit of our own back. If we did try longer journeys so as to get away from horse transport competition, we came into conflict with the railways, and when our transport showed promise of becoming a success, the railways would drop their freight charges and the firm's for which we carried had not the slightest compunction in returning their traffic to the railways and so leaving us without employment. We were all more or less in a small way, our capital being tied up in our rolling stock so that we were sorely pinched when encountering lean times. One of the many difficulties the pioneer haulage contractor in a small way experienced, was that of obtaining regular employment for his vehicles at remunerative rates. It is of course a usual difficulty to-day, but different. Occasional loads paid best, but it was impossible to fit them in so as to keep the vehicles in constant employment, so most of us found it necessary to obtain employment from such firms as millers and brewers. The rates per ton they paid us were small enough but the work had the merit of being comparatively regular, and no doubt we could have got along fairly comfortably, but even these people used to "let us down" most unmercifully. They were interested in our vehicles and they used us for experimental purposes. They did not reduce their own rolling stock in order to keep us employed but perhaps took a little from the rail and any surplus they could not manage themselves they gave us. Any evening they might tell us that we would not be required the next day, or perhaps they would require only one vehicle instead of four and we would be very fortunate indeed if at such short notice we could find employment for the next day; mostly we were unable to do so. Obviously motor haulage was ideal for brewers, millers and such traders—we proved it to be so to our financial loss and then they purchased their own vehicles! I, in desperation, determined to try my luck in the Manchester area, being tempted by the vast amount of haulage in connection with the cotton industry. But if I found it difficult in the Midlands where I had hitherto been operating, it was far worse in the northern Midlands. For some reason or other, mainly I believe because of the advanced stage of organisation in the carrying industry of that district, I was literally starved out. The few loads I did obtain usually occupied the best part of a day to collect in lots of hundredweights from the various warehouses, and the mills to which they had to be delivered were frequently almost inaccessible by road. The difficulties in the way of motor transport in the cotton area in those days is astonishing in view of the fact that more motor lorries are employed in that district to-day than in any part of the Kingdom.

The difficulties in the way of obtaining sufficient freight were only part of the trials of the pioneer motor haulage contractor. The vehicles themselves were thoroughly untrustworthy for the simple reason that the heavy motor was then in its infancy. The makers themselves were novices. The materials used in their construction were vastly inferior to those used in chassis construction to-day. The design and balance were poor and lastly there were few good drivers to be had. Having got the lorries off in the morning one lived in fear of the telephone bell for the rest of the day, and seldom was this fear not amply justified. Back axles and crankshafts were constantly breaking and break downs of this description meant days and nights on the road and entailed great expense in wages, time lost, the provision of relief vehicles, and the extortionate prices which had to be paid to the maunfacturers for spares in addition to the difficulty in obtaining them. There was no such thing as "service" in those days and we pioneers served the manufacturers as their experimental departments at our own expense. It was indeed expensive work as may be imagined from the fact that the bill I received from my manufacturers for repairs to two vehicles only, amounted to £300 in less than six months from the day I purchased them. For firms with a large amount of haulage of their own such as in the brewing and milling trades, the cost of transport was not of primary importance, there being incidental advantages which more than compensated for additional transport expenses and therefore they were able to "carry on" and gradually built up the huge fleets they own to-day.

The roads in those days also were a terrible handicap. Even in the large towns many of the streets were still water-bound macadam, whilst in the country there was nothing else. The road surfaces were rough and in the wet weather they were soft and provided heavy running. All heavy vehicles were shod with steel tyres so that in the case of snow the vehicles were idle for just so long as the snow lay on the ground. With vehicles inefficient as compared with those of to-day the fuel consumption was heavy under any circumstances and in very bad weather one hundredweight of coal per mile travelled was not exceptional. The road crusts too were weak and the road haunches were frequently unmetalled so that to draw into the side of the road to enable other vehicles to pass was courting disaster. The "bogging" of vehicles was therefore a frequent occurrence and was responsible for hours of delay. Truly the lot of the pioneer motor haulage contractor was not a happy one.

In those days the petrol lorry was only just making its appearance. I ordered one of the first to be made. It was a two-tonner with steel tyres. It took three days to reach my depot, a distance of about 150 miles from the works. Before accepting delivery, I insisted on a trial run and loaded it with two tons of mineral water for

Digitized by Google

delivery at a depot 20 miles from my own. It was supposed to travel 12 miles per hour but it took 6 hours to make the journey. It was towed home by one of my steam wagons and it was dismantled in my depot to see what was wrong. What was wrong was not difficult to locate as the change speed gearing had gone to pieces entirely as though the gear wheels were of lead instead of steel. I was assured by the manufacturers' representatives that this was nothing much and they would replace the gears for me. I would have none of it however, and in due course the vehicle was returned to the manufacturers' factory by train. It was a little experiment from which of course the manufacturers benefited, but which they would have had me carry out for them had I been willing, and it would have cost me a matter of £500. The manufacturers of course did benefit, for because of it and other similar experiences, the incentive was provided for steel manufacturers to concentrate on the production of more suitable steels for use in the motor chassis.

Pioneer motor haulage contractors were mostly forced out of the business by financial circumstances but whatever the reason may have been, we were all glad to be free of the anxiety and worry of it. But there were always others to take our places and reap the benefit of our experience. Few of us have however completely severed our interest in the business, and when we occasionally meet each other at the commercial motor shows at Olympia, we compare notes, and as we look around and see the evidence of the great development which has taken place since those early days we take legitimate pride in the part we took in giving this mighty industry a start, but we ruefully think of what might have been our position had we invested our money in some already established business—even had we waited a few years longer instead of essaying the part of pioneers.

Congratulations from W. Edwards.

President, The National Road Transport Employers' Federation.

FOUR years ago it gave me great pleasure to congratulate *The World's Carriers and Carrying Trades' Review* upon the attainment of its majority, and I am now pleased to be able to renew my congratulations upon the completion of its first quarter-century.

MR. W. EDWARDS.

The World's Carriers keeps abreast of the times in a wonderfully vitalising manner, for all interested in transport, in whatever form, may safely rely upon it to keep them acquainted with new departures and developments.

The rapid strides made in the last few years in particular branches of transport have brought in their train journals specifically devoting themselves to those interests, but *The World's Carriers* continues to provide a comprehensive survey of the whole field, presented in a pleasing and attractive form. By consistently maintaining this policy of giving equitable treatment to all branches of transport, and by the fairness and absence of bias which characterize its editorial comments, the journal has assured for itself a permanent place in the world of transport; and on behalf of this Federation and on my own behalf, I tender my heartiest congratulations to the Editor and to *The World's Carriers* upon the attainment of this conspicuous landmark in its history.

With all good wishes for the future.

W Edwards.

Congratulations from J. H. Turner.

President, Metropolitan and Home Counties Road Transport Contractors' Association.

As a subscriber to your journal from its inception, and as President of the Metropolitan and Home Counties Road Transport Contractors' Association, it affords me the greatest pleasure to congratulate you upon having attained your Twenty-fifth Birthday.

My mind goes back to those early days when it was most difficult for the views of haulage contractors to be adequately and fearlessly placed before the public, and your assistance at that time was greatly appreciated. Since the advent of mechanical transport you still maintain that position, without overlooking the fact that the horse still continues to be an economic factor in the life of the great metropolis, as evidenced by the wonderful parades which are held in Regent's Park on Easter Monday and Whit Monday.

MR. J. H. TURNER.

As a member of the London and Home Counties Traffic Advisory Committee, I would also express my thanks for the manner in which you, through your journal, so widely publish its rules and regulations that have done so much to speed up the traffic of London, congested though it still may be.

The best wishes of every member of my Association are with you, and if you will continue to collect, collate, disseminate and distribute views and information as fearlessly as you have done in the past, then continued success, which you so justly deserve, will be fully assured.

J. H. Turner

The Future of Transport.

Looking Forward.

By James Paterson, M.C.

Managing Director, Carter, Paterson & Co., Ltd.

To-day we are congratulating *The World's Carriers* on being 25 years old.

That is an age when a man may be beginning to earn respect, but *The World's Carriers* did so years ago.

At 25 one also begins to perceive what one may be able to do for the world, but generally the doing lies almost all ahead.

The World's Carriers has already done much for us, particularly in two ways; by letting us know what others are doing, and by its wise comments on events as they happen, which have helped to mould our opinions.

MR. JAMES PATERSON, M.C.

Is it permissible on this birthday to forsake the subjects about which we really know and to imagine what things will be like on its Jubilee, 25 years hence?

We now are only just beginning to realise what the additions to human knowledge, invented during the last 25 years, really give to us. By "we" I mean the middle-aged people—the sort who are asked to contribute birthday articles (and to give birthday presents)—you know the sort——

But those of us who live for 25 more years will see youngsters growing up to whom these things, new and wonderful to us, are just part of the equipment of a civilised world, to be used and not wondered at. All those who can get them will use the motor car, electric light and power, the telephone, the electric train, wireless, the aeroplane, and the new clothing materials, as common things of utility. They will do so just as we used the horse brougham, a candle, the speaking tube, the old steam train asphyxiating us in the "underground," and the village rumour which preceded the wireless! (I suppose that two smart well-matched hackneys, driven tandem, was the nearest to a "Moth" Aeroplane!)

What will these youngsters do with it all? Can they make still more of it, and be in 25 years time as different from us now as we are from those years of our own uncomfortable stiff and crabbed youth (when women wore worse clothes even than men do now)?

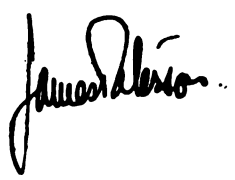
Have we educated enough of them to think and invent and continue the process?

For instance—will they have little motor cars with wings that spread out and lift them off the ground; to fly across country and then able to come down gently and at a reasonable speed on landing sidings beside the road near their homes and then drive along to them?—and will these cars be able to start and come down equally well on land and water?

Will they abolish the wasteful burning of coal in open grates, and get rid of smoke from our cities—Pittsburgh, like some of our own towns, only sees the sun on Sundays—will they stop that wicked tyranny of dirt and the disease that comes with it?

Will they plan our towns and our countryside too, remembering to have people who know about transport, sea, road, rail and air, on their committees (just examine the personnel of some existing committees and the ideas they have already put out!), and will they be bold and brave enough to leave war alone. We have done enough of that for them to make them able to live in peace if they will. And will they, by remaining in peace and by saving money now squandered on useless things, be courageous enough to scrap the ugly and filthy things that remain, and build better things and a better people?

Whatever they do, and whatever things have to be accomplished, may *The World's Carriers* continue to guide and help us as it has in the past.



Road Vehicles—Great Britain.

A return has been issued by the Ministry of Transport giving particulars of the number of motor vehicles registered for the first time during the month of June, 1929. Copies (price 2s. 6d.) can be obtained from H.M. Stationery Office, Adastral House, Kingsway, W.C.2.

The number of new motor vehicles registered was 31,968, including 16,723 cars taxed on horse power, 9,030 motor cycles, 4,594 goods vehicles, and 1,272 hackneys.

The return differs from the quarterly returns previously published in that it shews the number of each class of vehicle registered for the first time by each Licensing and Registration Authority analysed in detail according to various taxation scales, *e.g.*, motor cars under headings of horse power, goods vehicles under headings of unladen weight, hackney vehicles under headings of seating capacity, etc.

This detailed information was shewn in the previous quarterly returns for England, Wales, Scotland and Great Britain, but not for individual Authorities. The distinctions between saloon and touring motor cars and between goods vehicles with pneumatic and solid tyres respectively have, however, been restricted, as hitherto, to these three main divisions of the country and to Great Britain as a whole.

The Advance of the British Motor Industry.

Meeting Overseas Requirements.

By Alfred Hacking, D.S.O., M.C.

Director, British Manufacturers Section, Society of Motor Manufacturers and Traders.

THE modern automobile has proved to be the greatest permeating factor that the world has ever known, and in whatever locality the traveller may be he will be sure to come upon the ubiquitous motor car, lorry or coach. The world relies upon transportation, and whereas in former times many parts of the globe were content to continue the use of forms of conveyance that had endured since the earliest times, there is now everywhere a growing realisation that the prosperity of countries, trade and individuals calls for rapid and economical movement of produce and passengers.

Adequate transportation is vitally necessary for a virile community, and the Government and the Public Service Department, the large industrial concern in the city, the shopkeeper in the town, and the pioneer farmer in the "outback" are at one in their endeavour to secure for themselves and for those for whom they cater the speediest and cheapest method of conveying their produce, and their passengers, from one locality to another.

LT.-COL. ALFRED HACKING, D.S.O., M.C.

This need has naturally resulted in the universal use of the internal combustion engine, not only to supplement, but in many directions to supersede older forms, both commercially, owing to its greater flexibility, and privately by providing a new service of individual transportation. Economic transportation of its products is an essential factor in the success of every industry, and in the life of every nation, and the value of the motor vehicle in this respect has been abundantly demonstrated on many occasions the world over. In urban areas its ability to convey goods direct from the producer to the consumer has eliminated many of the delays that previously existed, while aiding considerably in the reduction of the cost of transportation with a consequential beneficial effect on the price of the finished commodity. In the wider sphere the motor lorry has aided considerably in pioneer work, for it has shown that it pays little attention to difficulties and has succeeded in opening avenues of transportation where before its advent no ready means of communication existed.

The motor vehicle has also rendered useful service in directions other than in improved communication and transport, for it has undoubtedly been the means of improving the financial position of the world. Improved transportation has, naturally, resulted in increased business and in a corresponding increase in the financial position of those concerned in distribution and production, while, of course, the increasing importance of what is still a comparatively new industry has had the effect of finding lucrative and productive employment for many thousands of skilled and unskilled artisans, not only in the major industry but in the very many auxiliary and ancillary trades allied to it.

The automobile industry in Great Britain, as in the other motor producing countries, has long realised the fact that the home market cannot be expected to provide a continuous and unceasing demand for vehicles, and in order to increase their market the manufacturers have turned their attention to fostering a virile export trade. In this respect, too, material benefit has been afforded to the financial position both of the exporting and the importing countries, for while it is readily appreciated that an expanding export business must react beneficially to the country making and exporting the vehicles, it is an indisputable fact that the money paid by the importing countries in securing the means of efficient and economical transport has resulted in financial benefits through the economical progress secured by increased transportation development.

It is thus but a short logical step to that further economic thought that while the development of export trade benefits both the exporter and his customer the benefit can be made infinitely greater if this reciprocal trading is confined to the British Empire, for while in Great Britain are the resources, the ability, and the factories to supply all the transport requirements of the Empire, the markets overseas offer vast potentialities which will place Great Britain unquestionably in that position of eminence in the motor markets of the world to which she is entitled.

The advantages of British design, construction and performance are acclaimed all over the Empire, and with the increasing use overseas of British motor vehicles it has been proved again and again that the former objections from the point of view of inadequate clearance and track can no longer be upheld. There is, too, a growing appreciation overseas that running-costs and second-hand values are two important considerations that need to be taken into account, and in these essential respects the British manufacturer, in the wide range of vehicles for every purse and purpose, can challenge his competitors in every part of the world.

It was frequently laid against the charge of the British manufacturer that he was indifferent to the needs of his potential customers overseas, and that he made little, if any, effort to study the requirements of his markets. However true that may have been in the past, though one is apt to be a little sceptical of the disinterestedness of such allegations, the home manufacturer has given conclusive proof that he is not only alive to what his overseas customer desires and is making every effort to satisfy those desires, but he has shown that the export position is of such vital interest and importance to him as to call for special visits, by delegations and by individual investigation, to the various overseas markets in order that he may have first-hand knowledge of the conditions under which his vehicles will be expected to operate.

Digitized by Google

British manufacturers have taken the offensive in the overseas markets, and their vehicles have been designed to cater specially for overseas requirements. As a tangible result may point to the evolution of the six-wheeled vehicle, which, by its special construction, will transport equally readily a useful load on roads or across country. At the other end of the scale one finds that substantial orders are being received from all parts of the world for the smaller utility cars of from 7-10 h.p., a field originated by the British manufacturer, for the world is beginning to realise that cars of these characteristics provide an efficient means of transport at the lowest possible cost of operation.

A liaison has been established between the British Manufacturers' Section of the Society of Motor Manufacturers and Traders and the Government, and other Authorities, and the machinery now exists for continuous and consistent discussion and representations on national, imperial and international matters by the various sections of the British motor manufacturing industry.

Branch offices have been set up in Australia, New Zealand and South Africa, and there is now perfect liaison between British factory representatives and distributors in these markets and the manufacturers at home. Results, slow but progressive, are already apparent in various directions, and even if the colossal difficulties inevitable in meeting the productive and financial resources of competitors are admitted, there is every reason to think that with stable conditions at home the improvement noticeable during recent monhts in the general export condition will not only be maintained but accelerated.

The export position is particularly encouraging. In every branch of the trade, cars, commercial vehicles, parts, chassis, and tyres, considerable progress has been made, and for the eight months from January of this year the total value of vehicles, chassis and parts sent overseas has reached £7,104,891, an increase of over £1,600,000 on the corresponding period of 1928.

In every overseas market British made motor vehicles are to be seen in increasing numbers. The farmer and fruit grower of Australia, South Africa, Canada and New Zealand, the tea planter of India and Ceylon, the rubber grower of the East Indies are all turning to motor transport for their requirements, and are choosing British vehicles as assuring to them the utmost value in design, workmanship and performance, in short, as giving them the greatest value for money. Even the picturesque rickshaw of the far east is giving place to the British 7 h.p. car, the man who formerly pulled the older vehicle now having become a sort of taxi driver.

Revolutionary methods have been adopted in the attempt to capture the world market for British manufacturers, representation is being secured in localities which were previously virtually closed to British vehicles, the position in former markets is being consolidated and expanded, and while there naturally remain problems connected with production, representation, distribution, and service, requiring anxious and careful consideration, it can be said that the efforts of British manufacturers are bearing fruit and that the period that lies ahead will see the British industry occupying a pre-eminent position in the motor markets of the world.

Austin Reed.

Congratulations from A. E. Millard.

President, Furniture Warehousemen and Removers' Association.

I have followed with very great interest the extraordinary progress which has been made by your valuable paper which has now attained its Twenty-Fifth Anniversary.

There can be no doubt that the development of the transport industries has, during the last twenty-five years, continued to be a dominant economic fact, and it would be difficult to place a value on the contribution of such development to progress generally. So far as furniture warehousing and removing is concerned, the effects have been direct, because any advance or change in the realm of transport intimately concerns the industry, businesses engaged therein being users of the three chief forms of goods transport, road, rail and sea. Your Journal has covered a period during which in the process of evolution the horse, to no small extent, gave place to the steam wagon, and now the internal combustion engine has, in a considerable measure, taken the place of horse-drawn traffic.

MR. A. E. MILLARD.

Being a Monthly Journal of the Carrying Trades of the World, *The World's Carriers and Carrying Trades' Review* serves an admirable purpose in giving within its pages information on such a wide range of subjects. I have found the information given from time to time to be of great assistance, and also noticed that you have been generous in the space you devote to the industry and the Association of which I have the honour of being President. Every furniture warehouseman and remover will, I am sure, agree with me that you have endeavoured to promote the interests of the industry with which you have been in close touch from the commencement of your Journal.

On the celebration of your Twenty-fifth Anniversary it is therefore a pleasure to me to wish you and your paper every prosperity.

A. E. Millard

Twenty-Five Years of the King's Highway.

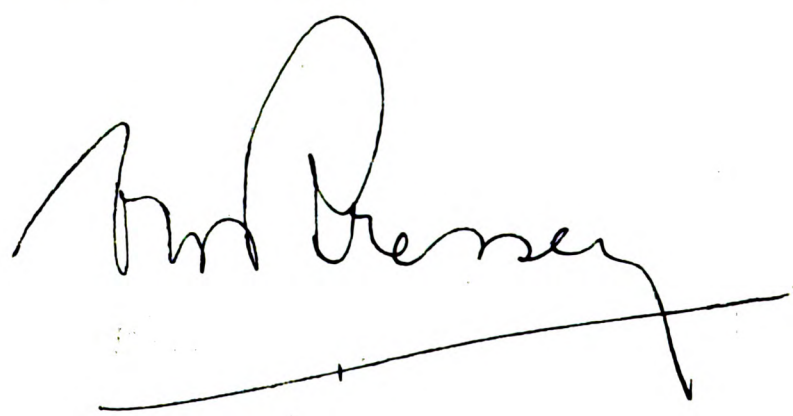
By Col. C. H. Bressey, C.B.E., F.S.I.

Principal Technical Officer, Roads Department, Ministry of Transport.

Some of the older generation, looking back over the twenty-five years during which your Review has been published, would probably feel inclined to deplore the changed aspect of the King's Highway. They would recall Dickens' racy descriptions of the coaching era and of the quiet country lanes down which the Pickwickians lumbered after a prodigiously massive lunch at Dingley Dell. And yet, to an impartial observer, was there ever a time when the roads presented a more animated and glittering picture than they do at the present time? Watch the traffic on one of the many bright week-ends with which we have been blessed during the past summer, and ask yourself whether a more brilliant carnival has ever been staged! Try to count the different types of vehicles now using the road, from the scooter and bathchair at one end to the saloon car, the motor coach and the six-wheeler at the other. The traffic-census forms issued by the Ministry of Transport recognise nearly thirty different categories, and attention is frequently drawn to the incompleteness of the list, which is already unmanageably long. Dr. Johnson once remarked that when a man is tired of London he is tired of life, and the same observation might well be applied to the road, which is now a source of pleasure and profit to such countless multitudes. (Heaven forbid that I should quote statistics! They are to be found in the Ministry's Road Fund Report, price 1/-.)

COLONEL C. H. BRESSEY, C.B.E., F.S.I.

The pageant of the road is so impressive that it demands the handsomest setting that can be devised. Every opportunity should be taken to adorn our highways by greensward, trees, shrubs and flowers. The beauty of our countryside is a commercial as well as aesthetic asset. Colonel Ashley, while Minister of Transport, recognised the importance of this subject by becoming President of the Roads Beautifying Association, and Mr. Herbert Morrison, the present Minister, acts as Vice-President in token of his interest in the movement for adding to the attractions of British roads. I commend the subject to the consideration of the very important body of road-users among whom your Review circulates.



"One-Way" and "Roundabout" Schemes for London Traffic.

From September 30th last, "one-way" and "roundabout" traffic schemes came into operation in the London area at the following points:—

"One-way" Schemes.

1. On either side of St. Mary le Strand and St. Clement Danes Churches, Strand, Westminster.
2. Melbourne Place, Aldwych, Westminster (from South to North).
3. Along the duplicate carriageways of—
   (a) Eastern Avenue, Ilford.
   (b) Woodford-Ilford Road, Ilford.

"Roundabout" Schemes.

1. Around the island on which the Gladstone Statue stands, at the junction of the eastern arm of Aldwych and the Strand, Westminster.
2. Around the central island at the junction of Eastern Avenue, Cranbrook Road and Woodford-Ilford Road, Ilford.
3. Around the island at the junction of the London-Portsmouth Main Road and Leatherhead-Surbiton Main Road at Hook, Surrey.

In order to facilitate the movement of traffic in the above areas, traffic direction signs have been erected and "white lines" laid down.

The regulations, with illustrated diagrams attached, may be obtained from H.M. Stationery Office, Adastral House, Kingsway, W.C.2., or through any bookseller at a cost of two pence a copy.

Any person acting in contravention of the regulations, will be liable to a fine of £5 for a first offence, and £10 in the case of a second or subsequent offence.

Twenty-Five Years of Industrial Transport.

By W. H. Gaunt.
Distribution Manager, J. Lyons & Co., Ltd.

I BELIEVE the changes in industry engendered by mechanical road traction over twenty-five years have been as great as the stages in the periods when steam, gas and electricity became successively in common use. Unfortunately, one must be over middle age to visualise this by experience. At the dawning of this century the acme of traffic facilities was to be attached by a siding to a railway, and if at a port, so that coastwise services could be used in competition, so much the better. Probably most firms had no serious alternative traffic facility to the railway for anything beyond local distribution. And the railways were so associated and individualized that a new facility, mutually convenient to a trader and railway in South Wales, could be vetoed by a minor railway three hundred miles away. A five ton unit was a problem to be lightly dealt with by few. A railway or dock strike might become a menace. At boom periods of trade, shortages of railway wagons were recurring features only to be met by the private owners' supply to aid the large user; the smaller firm could wait. There were quite a serious number of organisations or channels of adjustment to protect the trader against the limitations of the then facilities, now happily to a great extent superfluous. And our then latest dock developments, Tilbury, Immingham, Manchester Ship Canal, Trafford Park, were laid out with little regard to bulk road facilities. Railway service, with its then limited horizon, was in some centres strangled by its own growth, the City of Sheffield, to give an instance, being incapable of dealing with more railway traffic, whilst duplication was impossible.

MR. W. H. GAUNT.

Decentralisation of industry was only practicable to the extent of making a move into a country district where the railway service was to some extent monopolistic, and new problems of housing and labour replaced the old problem of congestion. There was a belt of country round London, for instance, which was to all intents prairie. It was undeveloped for manufacturing except so far as a railway service could do its limited best.

These conditions have been changed for the better by commercial road traction. Leaving out the growth of that industry, in the building and operation of which probably one worker in twelve of our population is engaged, the effect upon other industries has been far-reaching. There are very few trades, other than shipbuilding and mining, where present conditions are not affected, if not determined, by the incidence of a third arm to railway and canal as a means of assembly and distribution. The petrol industry is clearly a dependent growth, and so is quarrying and road construction, although probably what they have gained the railways and collieries have lost. But the many trades not directly engaged in the provision of road service but availing themselves of it are in the aggregate perhaps the subject of greater influence. The railways are having a hard time, the canals a worse; the true equation between the road user and the road provider may not yet have been fixed, but in the main the country is tremendously better served and equipped to serve. It must be right, in the long run, that every inhabited corner of the United Kingdom can be accessible for supplies of commodities which are not dependent upon one method of distribution only. And that agricultural areas, particularly market gardening districts, can reach great consuming centres from one hundred miles radius in a way impossible until the link was continuous from field to market.

Decentralisation is rendered possible when the removal to country land a few miles out can be served by supplies of labour brought in by motor bus, and goods can be equally easily distributed back to the consuming centres. Anything to be transported now up to twenty or thirty tons in one load can be effected by no more effort than a telephone call to one of several willing road contractors. Sheffield can develop independent of railway congestion, but the pressure can also be relieved by decentralisation. I think Mr. Vaughan Nash quoted recently the case of a new industry employing 16,000 hands assembled daily by modern road communication outside some large centre. This does not mean ruin to the railways, adversity may assist them in the end if they are wisely guided. I serve an industry which through road traction development is serving a quarter of a million customers' shops a week, not by any means by road, for the railways were never doing a fraction of the traffic they convey now out of that total, but stimulated by road facilities.

The huge individual traders stocks, necessary for a month or a season ahead, are now unnecessary, and the expense in interest, and what is more, in staleness, is a thing of the past. The countryside, however we may regret certain aspects of development, is now invigorated and capable of greater service to the country than ever before through road traction. We see more of it, we live more in it, we can work in it to greater advantage than ever before. The railways have been stimulated to take an interest in containers that their predecessors could easily have done a generation ago. An inland town has competitive channels of traffic to ports which only road traction has initiated, and our coastwise steamers by the accessory services of road vehicles are tapping new areas for traffic.

The work and outlook of a fully qualified traffic adviser has become more comprehensive and responsible. The old worries of undermining the brick wall of the railway service have given place to the art of contriving to get the best service out of alternative methods, of actually owning a useful fleet of road vehicles for certain purposes, of spreading an administrative control over district centres for sub-distribution, and generally taking a larger part in the policy and support of the industry he happens to serve. The transport department, at one time a necessary evil, has become an indispensable adjunct to all the progressive industries upon which this nation happily more and more is dependent.

Twenty-Five Years of Transport, as Reviewed in the Manchester District.

By T. H. Dunbabin.

Chairman, Manchester Transport (Owners) Association.

TWENTY-FIVE years does not, in the ordinary course, seem a very long period in history, but in Transport that quarter of a century has probably witnessed more changes than in many other industries. Twenty-five years ago all our transport was conducted by steam or water traction, and road transport as it was then known consisted almost entirely of horse-transport, with the result that its functions were naturally considerably confined to a small area. It could be said that road transport of those days operated within small zones around the various townships, and persons engaged in the business at that period had a very quiet time as compared with those engaged in the trade to-day.

MR. T. H. DUNBABIN.

Mechanical traction has developed beyond the expectations of the early pioneers who experimented in that process, the internal combustion engine is practically adaptable to any duty in the science of transportation, and at the moment we seem to be on the eve of greater use of electricity for means of traction.

To-day the roads are made to meet the needs of motor traffic, although we still have many horses in the industrial districts, but the glossy surface of our roads restricts the movement of the horse unless it is equipped with rubber pads which have been invented to assist him getting a grip on the slippery roads.

It is a pleasure to realise that with all the changes in the road transport industry *The World's Carriers* has played its part in the evolution, and it is very gratifying to think that a journal which in its infancy filled a want amongst carriers has steadily progressed with the industry, and to-day stands out as the Journal which one can rely on for the best reports as to trade activities and enlightening articles upon matters of moment. One can wish that *The World's Carriers* will continue its usefulness to the trade, and hope that when a further twenty-five years has passed those who are interested in the trade will be able to speak as highly of its usefulness as can be expressed to-day when celebrating the twenty-fifth birthday of the journal.

T. H. Dunbabin

Congratulations from

R. J. Howley, C.B.E.

Chairman, Standing Joint Committee of Mechanical Road Transport Associations.

FOR twenty-five years *The World's Carriers* has recorded the doings of the carrying trades of the world—a period of many difficulties and changes for those engaged in the great Transport Industry.

Twenty-five years ago horse transport reigned supreme in its limited sphere. To-day mechanical road transport knows no limits within these Islands in its service to the public. The future of the carrying trade will largely depend on a wise use of motor transport. All have to learn, and the interchange of ideas and experience provided for in the pages of *The World's Carriers* is a most valuable asset to the Industry.

Richard J. Howley

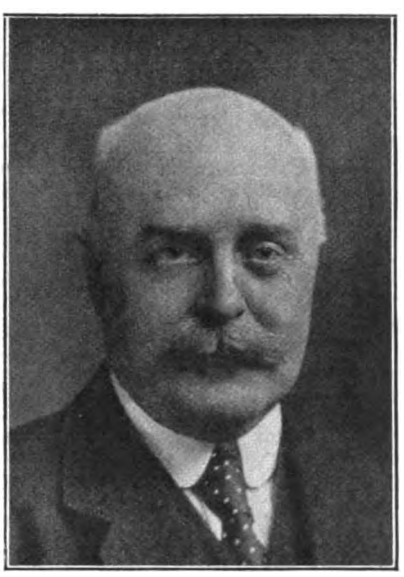
Congratulations from

O. Cecil Power.

Chairman, The Birmingham Horse and Motor Vehicle Owners' Association.

I AM very pleased indeed to have the opportunity of congratulating you on your "Silver" Anniversary.

I have read every issue of your interesting and instructive Journal month by month during the whole of the period, and I should like to compliment you on the great part you have filled in helping to develop the Transport Industry.



MR. O. CECIL POWER.

Your Journal has always dealt with contentious subjects without fear or favour and your articles have upheld the true traditions of the Press, while your own personality has enabled us all to take your criticisms, whether friendly or adverse, in the right spirit.

I hope you will long be spared to continue the good work you have carried on during the last quarter of a century.

O. Cecil Power

Shipping and Forwarding in Manchester.

By H. P. Lumb.

Chairman, Manchester Shipping and Forwarding Agents' Conference.

On the occasion of the completion by this Journal of a quarter of a century of important and successful work, I have been kindly offered the opportunity of writing, upon what is to us Manchester people a subject of absorbing interest, namely, the development of our city as a great port. Years ago, the possibility of establishing a port approximately 40 miles inland was regarded by many with scepticism. The foresightedness of the originators of the scheme has since been amply justified, and we can now claim that Manchester has taken its place amongst the foremost ports of the Empire.

The entrance of the Ship Canal is at Eastham, where there is a depth of 30 feet, thus allowing large vessels to come right up to the up-to-date docks at Manchester without difficulty.

During the last 25 years new sailings from this port to the Continent, and indeed to all parts of the world, have been established, and most of the important steamship lines have services from Manchester.

The Ship Canal was opened in 1894, when the tonnage in traffic at the port was 925,659 tons. Taking the comparison of the last 25 years an indication of the growth of the port may be obtained from the fact that in 1903 the total tonnage in traffic was 3,846,895 tons, whereas in 1928 it was 6,256,895 tons, being an increase of practically 100 per cent. in the last 25 years.

The Port of Manchester is well equipped to handle all kinds of traffic, the dock equipment being entirely up-to-date, being equipped with hydraulic, steam and electric jib cranes, electric grab cranes and 16 electric overhead travelling cranes, etc., also there is a self-propelling floating crane capable of lifting 60 tons.

It is interesting also to note that the following main line railways are connected with the Dock Railways of the Manchester Ship Canal Co., namely, L.M. & S., L. & N.E., and Cheshire Lines Committee.

Another interesting feature of the port is that there are two floating pneumatic steam elevators, each capable of the discharge of grain at the rate of 250 tons per hour, and a number of smaller portable elevators for the discharge of grain are also available.

As is well known, Manchester, being the centre of the cotton manufacturing district, it is only natural that Manchester receives cotton directly from the cotton growing countries, same being railed to the mills, where it is manufactured into what is known familiarly as "Manchester Goods." It is not, therefore, inappropriate that the Ship Canal Co. should have adopted the slogan "Manchester Goods for Manchester Docks."

It is in the clearing of consignments through Customs and attending to the dispatch to destination in accordance with consignees requirements and also in dealing with the shipping instructions of exporters to all parts of the world that the forwarding agent of Manchester comes into the picture. His part is to provide accelerated service, realising as he does that the merchant requires quick transit for his goods, both inward and outward, giving the merchant the opportunity to effect immediate sales and thus repeat orders with advantage to himself and the port. Naturally, in the course of the last 25 years, the work of the forwarding agent has become more onerous and he is now required to be able to give information on a variety of subjects, such as, through rates from Manchester to all parts of the world, explanation of English Customs Laws and information regarding their operation, Consular requirements in respect of foreign countries, which is supplied gratis, being part of the "service" the forwarding agent renders to the merchant.

With the growth of the port there was a desire for collaboration amongst the forwarding agents for the purpose of co-operation to the advantage of the consumer, and this was met by the formation of the Manchester Shipping and Forwarding Agents' Conference, which came into being on the 8th December, 1926. This Conference is now associated with the British Association of Shipping and Forwarding Agents, which latter Association is in contact with the great forwarding organisations of the Continent and in America. The interchange of information, etc., between members of the local Associations, and also as between the local Associations and the British Association, has been of great benefit to the merchants, and as a result of negotiations between the forwarding agents' association, customs officials and steamship companies, the working of traffic has been speeded up so that the merchant receives his goods at the earliest possible moment, which in these days of competition is a matter of great importance.

To those forwarding agents who up to the moment have not yet decided to range themselves alongside their colleagues for the common good, I would ask that they give the matter further consideration and give their support to what can only be looked upon as a progressive movement. Perhaps they will think it over.

In conclusion, I would like to take this opportunity of thanking Mr. Willis (the Editor of this Journal) for the help he has always given to the forwarding agents of this country, and for the generous manner in which he has always thrown open the columns of his Journal for the dissemination of matters of interest to those engaged in the transport business of this country. I wish this Journal all success.

International Horse Show, 1930. — The Nineteenth International Horse Show will be held at Olympia, London, from Thursday, June 19th to Saturday, June 28th, 1930 (both days inclusive). The offices are at 12 Hanover Square, London, W.1.

Change of Address. — Lamplugh Spring Seats, Ltd., have moved from 419 Abbey House, Westminster, London, S.W.1, to New Oxford House, Hart Street, Holborn, London, W.C.1. The telephone number is Holborn 9991-5 (5 lines).

The Institute of Transport.

A Brief Survey of its Development and Achievements.

By A. Winter Gray.

Secretary, Institute of Transport.

The Institute of Transport was founded in 1919. The proposal to establish an Institution devoted to the study of all phases of transport had often been advocated in previous years, notably by the late Sir William Acworth as far back as 1905. It was revived in May, 1919, by a communication from Mr. H. H. Gordon, published in *Modern Transport*, in which it was pointed out that there was urgent need of a more scientific study of traffic problems, for quantitative and qualitative investigation, for the determination of appropriate comparative units and for co-ordination and research. It was contended that only by the impetus of scientific study, perhaps by the Institute of Traffic and Transportation, could Britain hope to continue to lead the world in the development of facilities essential to progress.

This communication attracted wide attention, and many personages prominent in transport circles at that time expressed agreement with the views of the writer.

The Need for the Institute.

The case for the establishment of an Institute of Transport was best stated probably by the late Sir George Gibb, after agreeing that it should be easy to obtain general assent to the proposal.

The following are excerpts from views expressed by Sir George Gibb in 1919:—

"There is a great deal of work, of the highest practical value and importance connected with transport which is not done by any existing organisation and which requires for its doing some sort of agency like an Institution. But we must be clear at the outset as to what kind of Institution is needed. It is not an Institution merely to safeguard and promote the interests of an industry or of a professional class. The main object should, I think, be by collective and organised effort to widen the boundaries of knowledge in the sphere of transport and to extend the application of the methods of science. For transport is a science, having its own laws and principles which must in many respects be differentiated from the universals and economic science, and if the laws of Parliament differ from the laws of transport it is the latter which in the long run will prevail. Recognising this, what the national interest requires at the present time is that some stimulus and assistance should be given towards a more thorough and co-ordinated study of transport by economic thinkers, in combination with those engaged in the practical conduct of the business of transport. The one group cannot make progress without the other.

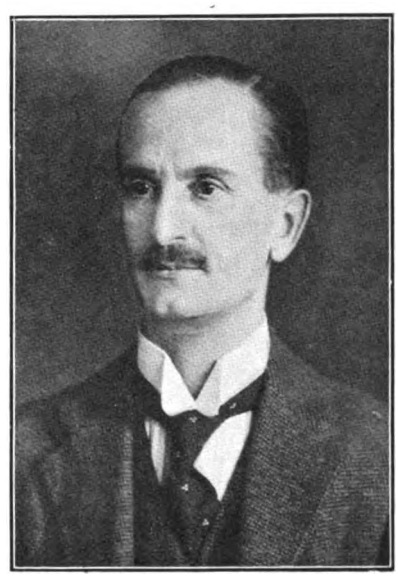
"The whole world, and Britain perhaps more than any other nation, is looking, with some anxiety, at the situation in regard to the future of transport. The truth is now realised with new force of conviction that transport is not only a key industry but the industry which keeps the keys of all other industries. And yet the principles on which this vital industry should be organised and carried on have been less fully explored and are more unsettled than is the case in any other section of our economic life.

"I venture, however, to suggest that success in solving the many and difficult problems of transport which await solution will not be won unless we can pool our mental resources, our experience, and our practical aptitudes. Hitherto, our economists have done less for us than our practical men. They have not even kept Parliament from making blunders in legislation. Perhaps even an Institution cannot. But at least it can be a clearing house for the exchange of ideas and information. Both are much wanted. No doubt the economist has been hampered by the impossibility of getting facts and statistics in the shape in which they are required for his purposes. What he means is not precisely what the goods manager or goods clerk requires. And yet, unless both co-operate, much is lost. It is just that waste which an Institution might help to recover.

"I think that the most useful work of an Institution would be to organise and facilitate meetings for the reading of papers and discussions. It is only in this way that any science can be advanced, and transport is perhaps the most difficult, as it certainly is the most neglected branch of economic science. It contains the most varied, delicate, complicated, elusive interior under a surface of apparent simplicity.

"An Institution of Transport, properly organised and equipped and adequately supported by all the interests that should be represented on it, would bring together in the pursuit of a common purpose, large and diverse groups of individuals on whose co-operation and combined knowledge and enterprise any great developments must depend. Railway experts must be there. Likewise those concerned are interested in all other forms of inland transport.

"Shipowners and shippers should be there, and dock people. The affinities and the differences between carriage by sea and carriage by land throw useful light on many obscure and unsettled questions in the science of transport. The enthusiasts for road transport will certainly not be absent, and they may find that studies and discussions conducted in the atmosphere of a scientific gathering with the aid of impartial critics whose aim is not money, but truth, will help them to restrict the percentage of waste which inevitably accompanies all movements to establish a new industry under conditions in which hope and faith are the only substitutes available for the moment for accumulated and proved experience.



MR. A. WINTER GRAY.

"Some think, perhaps too hopefully, that wealth can be created by making provision to convey it. So it can, within limits. Production is valueless without transport, but so is transport without production. A man who is wise enough always to know how to adapt the provision of the one to the needs of the other would be worth finding, and I really do not know how we can help to search for him better than by gathering all likely candidates for the distinction into an Institution of Transport."

Early Negotiations and Supporters.

An informal meeting of a number of leading and representative personalities in transportation who had expressed interest in the proposal to establish an Institute of Transport was convened by Mr. H. H. Gordon and was held at the Savoy Hotel on August 7th, 1919, when Messrs. H. E. Blain, F. C. Coleman, G. A. Dutfield, H. H. Gordon, T. B. Goodyer and Frank Pick were elected as a sub-committee and charged with the preparation of a draft scheme for the inauguration of such an Institution. Mr. W. M. Acworth subsequently acted in the place of Mr. Frank Pick during the latter's absence in America.

On November 3rd, following, a further meeting was held at the Savoy Hotel, with Sir Albert Stanley (now Lord Ashfield of Southwell) in the Chair.

Digitized by Google

At this meeting a resolution to found an Institute for the scientific study of questions relating to traffic and transport was adopted. Sir Eric Geddes, the first Minister of Transport was invited to become the Primus President of the Institute. A provisional Committee was appointed and given full powers to appoint the first Council of the Institute, to frame the Memorandum and Articles of Association, to secure the incorporation of the Institute, to appoint other officers, secure suitable offices and staff, to invite applications for membership, and to take all other steps necessary for the establishment of the Institute.

The first meeting of the Council of the Institute was held on February 9th, 1920, at the newly acquired offices at 2 and 3, The Sanctuary, Westminster. At this meeting, the following Officers and Members of the original Council were elected:—

President.

The Rt. Hon. Sir Eric Geddes, G.C.B., G.B.E., M.P. (Minister of Transport).

Vice- Presidents.

The Rt. Hon. Lord Ashfield of Southwell (Chairman of the Underground Railways and L.G.O.C. Group).

Sir Alfred Booth, Bart. (Cunard Steamship Co., Ltd.).

Sir Sam Fay (General Manager, Great Central Railway).

Sir Henry Maybury, K.C.M.G., C.B. (Director-General of Roads, Ministry of Transport).

The Hon. Sir Arthur Stanley, G.B.E., C.B., M.V.O.

Hon. Treasurer.

Sir Joseph G. Broodbank (formerly of the Port of London Authority).

Hon. Secretary.

H. E. Blain, C.B.E. (Operating Manager, London Underground Railways and L.G.O.C. Group).

Lord Ashfield was appointed Chairman of the Council.

Other business transacted at that meeting was the admission of 116 Members, 80 Associate Members and 3 Graduates. These members, with those elected up to and including the date of the Inaugural Meeting were designated "Foundation Members."

The Inaugural Meeting of the Institute was held on the evening of Monday, March 22nd, 1920, in the building of the Institution of Civil Engineers.

By the courtesy of the Council of the Institution of Civil Engineers, the Institute continued to meet in its Lecture Theatre down to November, 1921, when offices were taken in the building of the Institution of Electrical Engineers, on the Victoria Embankment, since when meetings have been held in the Lecture Theatre of that Institution.

INCORPORATION.

The Institute was incorporated as an Association not for profit on August 26th, 1920, under the Companies (Consolidation) Acts, 1908—17, and entitled The Institute of Transport.

On November 16th, 1926, a Royal Charter of Incorporation was granted to the Institute. The bestowal of a Royal Charter only seven years after its foundation was exceptional in the history of professional Institutions, and was regarded as a tribute to the leading part played by transport in the industry, trade and commerce of the British Empire. Upon the grant of the Charter, H.M. The King graciously accorded his patronage to the Institute, and H.R.H. The Prince of Wales the continuance of his valued recognition by retaining the office of Honorary President.

The principal objects of the Institute as defined in the Royal Charter which bear a close resemblance to those set forth in the original Memorandum and Articles of Association, are:—

> To promote, encourage and co-ordinate the study of the science and art of transport in all its branches, to initiate, foster and maintain investigation and research into the best means and methods of, and appliances for transport, transit and locomotion, and the problems that are involved and their most satisfactory solution, to extend, increase and disseminate knowledge, and exchange information and ideas in regard to all questions connected therewith and to assist and further in all practicable ways the development and improvement of transport, transit and locomotion in the best interests of the community.

DEVELOPMENT AND ACHIEVEMENTS.

The extent to which the Institute has fulfilled the aims and is achieving the purpose for which it was founded, may perhaps be gauged from a brief recital of its development and its leading activities.

The membership had already reached 700 at the close of the first year. Since then it has steadily increased and spread throughout the world. Now it exceeds 3,000. Overseas members constitute some 20 per cent. of the latter total; they are resident in Canada, Australia, New Zealand, India, Ceylon, Africa (South, Central and West), Egypt, the Sudan, Burma, and the Federated Malay States, as well as in the United States of America, France, Belgium, Spain, the Argentine, Brazil, China, Siam, and other foreign countries.

In the first session three meetings were held; during 1929-1930, approximately 90 meetings will take place under the auspices of the Institute. Since the close of the first financial year, income and expenditure has been more than quadrupled.

Every endeavour has been made to ensure that those elected to Corporate Membership are fully qualified by knowledge and experience. Those occupying positions of lesser importance and responsibility may be admitted as Graduates and Students, and the opportunity is afforded by examination for them to be elevated to Corporate rank.

The dissemination and active promotion of the influence and objects of the Institute at home and abroad have been furthered by the formation of Local Sections and Graduate and Student Societies in the United Kingdom and of Centres in overseas countries. The first local section was established at Manchester in January, 1921. Others followed at Birmingham (December, 1923), Newcastle-on-Tyne (May, 1924), Leeds (December, 1924), Bristol (September, 1925), and Edinburgh (February, 1928). Graduate and Student Societies, for the encouragement of the discussion of transport subjects by non-corporate members were formed in London (1921), Birmingham (1925), Manchester (1928), and Leeds (1928). Two overseas centres have been constituted, the South Africa Centre (1926), and the Argentine Centre (1927); and negotiations are in progress for the formation of similar centres in India, Australia and New Zealand.

Meetings for the reading and discussion of papers on transport subjects have been held regularly since the foundation of the Institute. Educational lectures for Graduates and Students by specialists have also been delivered. The reports of these meetings and lectures constitute the "Proceedings," and the journal in which they are printed, together with other matter of professional interest, forms the link whereby they are transmitted to members, students of transport, and other learned societies all over the civilised globe. The many papers read before the Institute have been a valuable addition to contemporary transport literature, and have been the means of providing much informative and statistical matter, previously unobtainable. Publication of the journal was commenced during the first session of the Institute's existence. The growth of the journal, and incidentally of the activities of the Institute, may be gauged from the fact that whereas the first volume contained only 74 pages, the last and tenth volume comprised 520 pages.

The problems of traffic and transport are many-sided, and their study has always involved the utilisation of the knowledge of those engaged in other professions. To secure the fullest measure of co-operation and exchange of views and practice, joint meetings with kindred institutions have been held in the past, and others have been arranged and are in contemplation for the future. Similarly, specialists in other countries have been and will be invited to contribute to the Proceedings of the Institute.

The desirability of encouraging communications by the recognition of meritorious contributions to the Proceedings, was not overlooked in the work of establishing the Institute, and the Council, in its first Annual Report, was able to announce the donation of premiums in the form of gold medals, for papers on railway and road transport subjects. The premiums now available, comprise:—

Institute Gold Medal. Awarded triennially for the most meritorious paper contributed during the previous three years.

Railway (Operating) Gold Medal. Donor: The Railway Companies' Association.

Railway (Engineering) Gold Medal. Donor: The Railway Companies' Association.

Road Transport Gold Medal. Donor: The Commercial Motor Users' Association.

Road Transport (Passenger) Gold Medal. Donor: The Underground Railways and L.G.O.C. Group.

Aerial Transport Gold Medal. Donors: Sir Henry White-Smith, C.B.E., and the Bristol Aeroplane Co., Ltd.

Water Transport Gold Medal. Donor: The Dock and Harbour Authorities' Association.

Water Transport (Canal) Gold Medal. Awarded biennially. Donor: The Canal Association.

Institute Graduate Silver Medal.

Institute Student Silver Medal.

"Modern Transport" Premium. Donor: "Modern Transport."

The holding of Congresses at various centres in the country for the discussion of papers and inspection of works and places of transport interest has been a special feature of activity, and has also provided opportunities for intercourse between members in all branches of the industry. The first Congress was held at Manchester in January, 1921. Subsequent Congresses were held at London (1921 and 1925), Sheffield (1923), Bristol (1924), Birmingham (1927), Liverpool (1928), and Harrogate (1929).

Digitized by Google

The next development after that of holding meetings at provincial centres, was the organisation of tours to study foreign transport methods and equipment, and the first such tour was undertaken in June, 1929, when a visit of some 80 members was made to Switzerland. A carefully planned itinerary gave the participants the opportunity of inspecting a number of transport systems and ancillary works, and also of travelling through some of the most beautiful scenic districts of that country.

The Institute's educational work has principally been concerned with the promotion of its examination scheme, and of classes and courses of study in preparation therefore. Study has, however, been facilitated for many by the development of the library, which, though it has been restricted by considerations of space at headquarters, has steadily expanded, and, it is hoped, will eventually comprise one of the most comprehensive collection of works and material on transport subjects.

The Institute Examination Scheme.

The Institute educational and examination scheme had its origin in the suggestion made by the Rt. Hon. Lord Ashfield of Southwell in his Presidential Address in October, 1920, (*i.e.*, twelve months after the foundation of the Institute), that the Institute should nominate a Committee to enquire into existing and prospective educational facilities with a view to assisting in the co-ordination of means of training for those upon whom the future responsibility of directing transport work will fall.

Shortly afterwards, the Council appointed an Educational Facilities Special Committee. After surveying the field of existing and prospective facilities it reported "it believed the educational aim will be most effectively secured by the arrangement of qualifying examinations by the Institute under its own examiners." The special committee having completed its labours was dissolved and, in its place, a standing Education Committee was appointed to give effect to the foregoing expression of belief. At the first meeting of the latter Committee, held on October 31st, 1922, Mr. Philip Burtt was elected Chairman, a position he occupied until 1926, when he was succeeded by Mr. A. L. Barber.

Some of the initial difficulties which the Education Committee had to surmount, were:—The wide field of transport operation, economics and administration to be covered; the absence of any complete or comparable transport examination scheme; the dearth of special transport training facilities and text books; and the lack of examiners combining professorial qualifications with practical knowledge and experience.

Notwithstanding these disabilities the Committee framed regulations and syllabuses for the Graduateship and Associate Membership Examinations. These were issued in book form in 1924, and were followed in 1926 by a more complete scheme. In its heavy and responsible task, the Committee was fortunate in securing the assistance of leaders in all branches of transport, and of representatives of certain of the principal Universities. The latter included Dr. Brysson Cunningham, Professors A. L. Bowley, L. R. Dicksee, and J. L. S. Hatton (London), Principal Grant Robertson, and Professor J. G. Smith (Birmingham), Professors H. M. Hallsworth (Durham), J. H. Jones (Leeds), F. C. Lea (Sheffield), and Dr. K. G. Fenelon (Edinburgh). Since 1924 there has been an annual issue of the regulations and syllabuses.

The first examination took place in April, 1926, at London, Leeds, and Manchester. Examinations were subsequently held in 1927, 1928, and 1929. Centres have been established at London, Birmingham, Bombay, Bristol, Edinburgh, Hull, Johannesburg, Leeds, and Manchester. The total number of candidates examined to date is 469.

As a result of overtures made to the principal educational institutions throughout the country, numerous courses of transport study have been provided. The Institute examinations have encouraged the production of many books and works on transport.

The educational policy of the Institute has throughout been directed to the framing and perfecting of courses of study for those engaged in or desirous of entering the transport services, and to encouraging research and investigation in transport science. In this field there can be discerned one of the most promising sources of the steady if often imperceptible work of the Institute in advancing the science and art of transport.

Roll of Presidents.

The Roll of Presidents given below serves as a further evidence of the varied interests represented by the Institute.

1919-20. The Rt. Hon. Sir Eric Geddes, G.C.B., G.B.E.
1920-21. The Rt. Hon. Lord Ashfield of Southwell.
1921-22. Sir Henry P. Maybury, K.C.M.G., C.B.
1922-23. Sir Sam Fay.
1923-24. Sir Joseph G. Broodbank.
1924-25. Sir Lynden Macassey, K.B.E., K.C.
1925-26. Sir Joseph Nall, D.S.O., T.D.
1926-27. Mr. R. H. Selbie, C.B.E.
1927-28. Mr. Roger T. Smith.
1928-29. Air Vice-Marshal Sir W. Sefton Brancker, K.C.B., A.F.C.

The President for 1929-1930, Sir Josiah C. Stamp, the Chairman and President of the Executive of the L.M.S. Railway, took office on October 1st, 1929.

Representation on Council.

The affairs of the Institute are administered by the Council, the Ordinary Members of which are elected by the Corporate Members. The Charter provides that, so far as may be practicable, each branch of transport shall be represented on the Council in the proportion of the total number of Corporate Members of each branch to the total number of Corporate Members of the Institute. When compiling the annual list of nominees for vacancies, the Council has always been careful to give effect to the spirit and intent of this provision.

Future Possibilities and Prospects.

This survey of the past would not be complete nor possibly even useful unless it were supplemented by a contemplation of the future and the manner in which that future may be worthy of, and best developed work already accomplished.

The first subject that inevitably arises in an attempt to survey future possibilities and prospects is that of a permanent home for the Institute. The Institute has already outgrown its existing accommodation, and is badly in need of more spacious quarters. With a steadily increasing membership of over 3,000, the time cannot be far off when the Institute will be turning its thoughts towards the acquisition of worthy and dignified headquarters, with lecture hall, library and rooms for members for study and social purposes, in addition to adequate space for offices and committee rooms.

In future developments, as the opportunity arises, the library should occupy a prominent place, effort being directed to the inclusion of every work or record having any important bearing on transport and the establishment of a real "workshop" for students of transport.

The spreading influence of the Institute and growing desire for the study and discussion of transport problems will doubtless show itself in the formation of still further local sections and Graduate and Student Societies in the United Kingdom and centres in overseas countries. The improvement of the facilities for transport education generally, in this country and eventually throughout the world, is a matter which has received the closest attention by the Institute since its inception and in which even more rapid progress may be expected in the future. Effort there must be to ensure that every transport student will have at his disposal the means for adequate instruction, and at the same time the Institute itself will need to extend the number of centres at which it will examine candidates. The foundation of Chairs of Transport at Universities, and the endowment of transport scholarships are developments which no attempt to visualise the future of transport education will be complete without mentioning.

As the resources of the Institute are added to an increase in the direct services offered to members would be an appreciated development. The investigation of special transport problems and the dissemination of conclusions reached; the publication and circulation of summaries of transport literature from the technical periodicals of all countries, of notes on legislation, legal decisions, etc., are examples of information, the distribution of which would be welcome.

Further premiums, particularly for Graduates and Students, is an additional inducement which must be borne in mind for the further encouragement of transport study among the younger members.

These are but a few of the possibilities which can be envisaged in contemplating the future of the Institute of Transport. But in whatever paths the material developments may follow it can be anticipated with confidence that the Institute will further consolidate its position in the transport world and will continue its labours in the best interests of the community.

Some Activities of the Commercial Motor Users' Association.

By Frederick G. Bristow, F.C.I.S., M.Inst.T.

General Secretary, The Commercial Motor Users' Association (Inc.).

ESTABLISHED on November 5th, 1903, at a time when the commercial motor industry was in its infancy, the history of the Commercial Motor Users' Association is very largely the history of road motor transport, as is also that of *The World's Carriers and Carrying Trades' Review*, which was first published a year subsequent to the foundation of the C.M.U.A. In the early days of this new industry it was found desirable to draft new regulations to deal both with the construction and use of commercial motor vehicles, and the need for an organisation to protect the interests of users of these vehicles, to undertake public work on their behalf and to assist in the drafting of the new regulations was more than apparent.

Notwithstanding the many difficulties which are invariably experienced in the early development of any new movement and of any new organisation, the C.M.U.A. made steady progress, which although slow before the War has been greatly accelerated in recent years, with the result that whereas in 1914 the number of commercial motor vehicles owned by members of the Association was less than 10,000 it is to-day in excess of 100,000.

PIONEERING WORK.

As one would expect from an organisation established so early in the history of road motor transport, many of the early activities of the C.M.U.A. were of a pioneering character. To give just two instances. So far back as 1904 the Association was considering the difficulties experienced by users of steam wagons in obtaining adequate supplies of clean water for their vehicles on the highway, and had many conferences with water and police authorities with a view to drawing up a scheme, which could subsequently be put in operation in all parts of the country, with the object of overcoming these difficulties. Certain material improvements were effected, but it was not until 1920 that full co-operation of the varied interests was secured, when a Joint Committee representative of the Ministry of Transport, water authorities, motor manufacturers and commercial motor users evolved a scheme of roadside water supply from service boxes erected on the highway and operated by metal tokens, which scheme is now in successful operation.

MR. F. G. BRISTOW, F.C.I.S., M.INST.T.

On the passenger side of the industry the C.M.U.A. realised that the more rapid development of the motor cab would be secured if greater facilities were afforded to the cab-using public. Accordingly in 1906 the Association gave evidence before the Select Committee on Cabs and Omnibuses, and suggested *inter alia* that telephones should exist on cab-ranks, particularly those in side streets, and in 1910 it defrayed the cost of and carried through the necessary arrangements for the trial of a cab-rank telephone, alongside a cab-rank with no shelter accommodation, the first to be erected. The experiment was entirely successful, and the Postmaster-General has since equipped a large number of ranks with similar telephones.

ENCOURAGEMENT OF DRIVERS.

The C.M.U.A. has from its inception held the view that the encouragement of commercial motor drivers to take all possible interest in the care of the vehicles in their charge is in the best interests not only of their employers, but also of the road motor transport industry as a whole. With the object of encouraging drivers to take a personal interest in their vehicles and to run them without accident, the Association has, since 1907, organised parades of commercial motor vehicles and examinations of drivers in London and the chief provincial cities, when medals, diplomas and monetary prizes have been awarded. These parades have invariably received the support of police and highway authorities.

The C.M.U.A. in 1911 instituted its Drivers' Award of Merit for acts of distinction in connection with the driving of public service and commercial motor vehicles, and since that date drivers from different parts of the country have been the recipients of the award for courageous conduct and their names have been inscribed on the Drivers' Roll of Honour of the Association.

Lectures and talks on a variety of subjects dealing with the construction, maintenance and driving of commercial motor vehicles are frequently arranged for drivers in the employ of members, and there is no doubt that they have not only proved educational to the drivers but have helped to foster a better understanding between the men and their employers.

PARLIAMENTARY WORK.

Perhaps the most important branch of the C.M.U.A. activities has been its Parliamentary work. From the earliest days of the industry the Association has been particularly active in relation to the various regulations affecting commercial motor vehicles which have been drafted by Governnment Departments. A prominent part was taken by the Association in arranging the evidence placed before the Local Government Board Departmental Committee appointed in 1903 "to consider the existing conditions of usage and to frame new regulations respecting tare weight, diameter of wheels, width of tyres, etc.," and as a result of the representations made, considerable improvements were effected in the Heavy Motor Car Order as at first drafted by the Board.

Similarly, in 1905, the Association laid the case for the users of commercial motor vehicles before the Royal Commission on Motor Cars, and again in 1912 it was successful in securing a number of amendments to the Motor Cars (Use and Construction) Order, 1904. In 1915 and in 1920 it presented evidence before Committees appointed by the Local Government Board and the Ministry of Transport respectively to enquire into the sufficiency of the existing laws and regulations relating to the use and construction of Heavy Motor Cars, and a number of recommendations of the Association were adopted by the Committees.

Many further successes have been achieved by the Association in connection with its Parliamentary work, particularly its opposition to excessive direct motor taxation, restrictive regulations regarding axle weights and speeds, and other matters connected with road motor transport operation, which have proved of advantage to commercial motor users.

Mention must also be made of the fact that many of the proposals which the Association has advocated for years and which were submitted to the Royal Commission on Transport in its official evidence this year have been included in the recommendations of the Commission.

WEAK BRIDGES AND LEVEL CROSSINGS.

The effect of weak bridges and level crossings on the economic running of road motor transport has occupied the attention of the C.M.U.A. for many years, and the Association has taken all available steps to bring about relief by new legislation and other means.

In moving the Second Reading of the Bridges Bill in the House of Lords on the 14th February, 1929, the First

Digitized by Google

Commissioner of Works (the Most Hon. the Marquess of Londonderry, K.G.) referred in particular to "the representations which had come from the Commercial Motor Users' Association as to the serious loss and inconvenience caused to trade and industry by the existence of weak links in the highway system of the country." The Act *inter alia* enables highway authorities and owners of bridges to effect arrangements with regard to the improvement or reconstruction of bridges and approaches and the maintenance of the roads which they carry, without the necessity for specific sanction in every case, and although the Act may not give all that is desired in removing these "blots" from the highway, it will certainly go some distance towards the removal of what are undoubtedly a definite hindrance to the efficient operation of commercial motor vehicles.

The Association has consistently advanced the plea that level crossings are a constant source of danger, delay and congestion to road traffic, and it is gratifying to be able to place on record that the recommendation of the C.M.U.A. that effect should be given to a programme for the speedy elimination of railway level crossings on all classified roads has been adopted by the Royal Commission on Transport. There are more than 200 level crossings on Class I roads alone, and in welcoming the steps which have been taken by the Minister of Transport in inviting local authorities to submit a five years' road and bridge programme, it is earnestly hoped that a number of projects for the abolition of level crossings will be included.

Royal Recognition.

His Majesty the King has always taken a keen interest in the work of the C.M.U.A. and in 1911 honoured the Association by granting His Royal Patronage to the London Motor Parade and permitting the Royal Motor Luggage Van to head the parade.

In 1920 His Majesty again honoured the Association by becoming Patron of the C.M.U.A., and this additional signal favour of Royal recognition marked the beginning of a new era in its history.

The prestige attained by the C.M.U.A. during its comparatively short period of existence is further indicated by the consent of His Royal Highness the Prince of Wales to be the principal guest at the Twenty-fifth Anniversary Banquet which is being held this month, at which function he will propose the toast of "The Association."

Conclusion.

The above is necessarily a very brief summary of the activities of the C.M.U.A., which organisation has always taken a leading and active part in every movement of importance and interest to commercial motor users.

This contribution to the twenty-fifth anniversary number of *The World's Carriers and Carrying Trades' Review* would, however, be incomplete if the fullest acknowledgment were not made to that Journal for the steps it has always taken, throughout its very successful period of publication, in fostering and assisting road transport.

Road Transport in East Lancashire.

By Thomas Fletcher.

Secretary, Commercial Motor Users' Association, Blackburn Area and East Lancashire Road Transport Association (Joint Organisation).

The East Lancashire Road Transport Association acting as a joint organisation with the Commercial Motor Users' Association has by its dual constitution had the opportunity, and it has certainly embraced it, of representing road transport in all its aspects, in the important highly industrialised area in which it operates. The organisation is fully recognised and even supported by the whole of the local authorities in the large area covered in spite of the fact that at some period of its existence it has been compelled to oppose local legislation of the several authorities in the area for the benefit of road transport interests generally. The organisation is representative of all forms of road transport from the light horse to the heavy petrol and steam vehicles and works sectionally to effectively cover the varied interests of its members. The Executive Committee is fully representative from the road transport point of view of the following interests:—Horse and motor haulage contracting, the cotton industry, coal distribution, the brewing industry, the co-operative societies' interests, and the general interest of goods delivery, heavy and light, including the use of vehicles ancillary to the trades or industries mainly composing their owners business. No little part of the activities of the organisation has been confined to the interests of motor coach and omnibus owners, of which there are a great many in the area. The work undertaken by the Joint Association includes the regulation of wages and labour conditions, legal advice and defence, assistance in all matters, and they are multitudinous, in connection with the use and ownership of road transport vehicles, negotiations with local authorities on all matters relating to roads, licensing, hackney stands, parking of vehicles, etc., traffic organisation, opposition and representation in connection with local legislation adversely affecting the general interest of road transport, the organisation of road transport parades and demonstrations, with the dual object of encouraging the ownership and use of a good class of vehicle and driver and keeping before the public the advantages of the use of road transport. Members are kept fully posted with all new legal enactments and regulations, and they are kept up-to-date with information on the law and its effect on the operation of road transport. Costings for all sizes and weights of vehicles are issued annually, and particularly after any alterations in costs such as licences, petrol and wages. The oganisation also contributes financially and otherwise in any national matter where the interests of road transport are affected. With a rapidly growing industry, which although only young, as yet, has made and seen many great changes affecting its interests, the necessity for intensive organisation is apparent. Competition within the industry is keen, and that of other forms of transport is formidable.

The National Road Transport Employers' Federation.

By R. P. Bailey.
Secretary, National Road Transport Employers' Federation.

As the struggles of the war led to a revival of a national self-consciousness, so the need of an effective method of dealing with trade problems was impressed on all minds, and this prompted the government to initiate an enquiry which led to the voluntary establishment of Whitley Councils.

So also in the road transport industry the growth of local or district associations with their conflicts and disputes—often leading to settlements which had prejudicial effects upon other areas—created the need for a more effective method of dealing with these matters, and led to the formation of a national organisation as an essential stage in the development of the industry, and tended to substitute as an alternative procedure, a central arena, with the view of creating a greater balance of power as between the contending factors.

It constituted a recognition of the fact that the trade of the whole country was bound together by a community of interests.

The whole aspect of Industrial life was changing. Marked improvement had been made in the life of the workers, and the latter, taking advantage of the economic conditions then prevailing, were pressing for greater advances in the improvement of their industrial condition. It was not until the last year of the war, however, that the idea of forming a national organisation for road transport found definite expression. In December, 1917, every association in the country had received a demand from the union for a wages increase. At the instance of Sir George Askwith, a conference of representatives of these various associations was convened in London with the view to making a settlement upon some uniform and definite basis. Agreement was reached, and the award of the Commissioner was promulgated on the 8th January, 1918. This conference having served the purpose of bringing all the organisations together, the immediate outcome was a unanimous desire for unity and co-ordination, and with this object in view, a further conference was held in Manchester in January, 1918, at which 84 representatives of the trade throughout the country attended. The business of the conference, although not without its difficulties, was successfully accomplished, and at a later meeting in March, the National Federation was launched with Mr. G. A. Dutfield, J.P. as its first President.

MR. R. P. BAILEY.

The country was then passing through a period of grave anxiety. Labour was scarce, and the trade found great difficulty in maintaining a supply of fodder for its horses, all available supplies being sent overseas. The Federation made every effort to cope with the situation. In July, 1918, further demands of the union for increased pay were considered and conceded under an arbitration. Reports of the success of our armies on the western front were now beginning to filter through, giving every promise of ultimate success.

The unions in all sections of trade visualising the effect which demobilisation would have upon the labour market, began to strengthen and consolidate their positions before the return of the troops. Industrial unrest was prevalent in all important industries, and at times, entire dislocation of trade was threatened.

The grouping of the miners, railwaymen and transport workers into the "Triple Alliance," made them the strongest organisation in the country, and they had laid plans for a great revolutionary movement. In December, 1918, simultaneous demands were made for lessening the hours of labour, the transport workers for a 44 hours week, and the other sections for a 48 hours week, coupled with increases of pay. These were resisted in all quarters, and there is little doubt that a general strike was prevented solely on account of the critical stage which had been reached in the peace negotiations then under consideration.

After protracted meetings, the demands of the miners and railwaymen were conceded, but actual settlement would not be acknowledged by the unions until agreement on the transport workers claim had also been reached. It was in this section that the great fight was being waged, the employers refusing, even under the greatest pressure, to concede the 44 hour week. The transport workers would accept no compromise, and a deadlock followed. The Minister of Labour, however, after being in communication with the Prime Minister, strongly urged a settlement, and negotiations being again resumed, the employers conceded the 44 hours week for all dock and riverside labour.

Separate negotiations for the road transport workers resulted in a recognition of the difficulties of the trade, and a 48 hours week was agreed upon.

A Joint Industrial Council for road transport was immediately set up and was doing useful work until the old question of the non-associated employers refusing to accept the agreed schedule of wages became acute. The Joint Council brought great pressure to bear upon the Minister of Labour to introduce a Bill giving statutory force to voluntary agreements, but on grounds of policy, and chiefly because the Labour congress had not agreed to the principle, the Minister would take no action.

The Industrial Council was very short lived. Except that it provided machinery for dealing with matters of wages and working conditions, no permanent benefit was derived by the trade. Its demise came about in 1920, over a demand to establish a minimum wage of 87s. per week for a single horse driver with corresponding advances in other grades. This demand was undoubtedly inspired by the successful issue of the dockers claim for 16s. per day.

The employers' panel of the Council would not entertain it, and as the other side would neither modify nor withdraw the claim, the Council broke up. Efforts were immediately made by the Minister of Labour to keep the machinery active, but without avail, and from that time onwards it ceased to function.

This was a severe blow to all efforts at organisation. It came just at the time when the trade slump had set in, and disintegration followed. Associations dropped back to the old method of local negotiations.

There had always been difficulty in maintaining cohesion and organisation in the trade, mainly on account of the large number of small units operating within it. When, therefore, the Royal Commission on Transport was set up, the Federation directed its attention particularly to this matter. It asked for unification of wages and working conditions throughout the country, which should be divided into reasonable areas for that purpose, pointing out that it could not be supposed that one set of rates and one set of working conditions could be operated throughout the country. It submitted that the industry cannot be properly organised and regulated so long as some vehicle owners are permitted to engage intermittently in it, and in order to give effect to this, the Federation suggested that haulage contractors should be licensed, and such licences issued only to bona-fide contractors in the areas which it was suggested should be defined. It proposed that area transport authorities should be set up composed of representatives of the industry, traders and the Ministry of Transport, and possibly a representative of municipal enterprise. It submitted that co-ordination could not freely come about whilst the conditions of the industry are as loose as they are at the present time and whilst the industry is of such an open nature.

Although the work of the Federation up to 1922 had been largely directed to industrial questions, the matters of taxation and legislation had not been overlooked, and through the medium of the standing Joint Committee of Mechanical Road Transport Associations, much useful work has been accomplished.

Digitized by Google

In 1929, the Federation took individual action in opposing the Railway Bills, whilst it has co-operated with the National Confederation of Employers on the Factories Act and the Washington Convention.

This question of the Washington Convention for an 8 hour day and a 48 hour week, which the present Government intends to ratify, is a matter which affects Road Transport more vitally than any other industry, as it would be impossible to operate the trade within such rigid restrictions, and the Federation is fully alive to its importance.

The Federation has been exceedingly fortunate in enjoying the leadership of two very able and competent Presidents. Mr. Dutfield, whose name was a household word in industry, relinquished the office in 1922, and was succeeded by Mr. W. Edwards, of Liverpool, who, having also served the office of Vice-President since the formation of the Federation, has done yeoman service on its behalf.

Transport in Birmingham.

By Thos. Hawkins, J.P.

Secretary, Birmingham Horse and Motor Vehicle Owners' Association.

I NOTE with much interest that your journal celebrates its twenty-fifth anniversary next month, and I would like to heartily congratulate you on the success you have achieved during that period.

My first introduction to your paper was at the inaugural meeting of the National Union of Horse & Vehicle Owners, 1909. I well remember the assistance you gave in the extensive report you published of the proceedings, which, I think, was the beginning of a great improvement in the Transport Industry as a whole.

My Association (The Birmingham Horse & Motor Vehicle Owners' Association) in conjunction with the then President (Mr. Meynell Hunt) decided to convene a meeting of persons interested in transport work with a view to the formation of a National Body. The result was highly satisfactory, and it is pleasing to note that many centres now have an Association of a similar character to protect their trading interests and to improve the Transport Trade in general.

MR. THOS. HAWKINS, J.P.

My Association, I am pleased to say, has made excellent progress during the past 25 years, and has established quite an influential position in the City of Birmingham. We have found that the sectionalising of the various interests in the Trade has been highly satisfactory in connection with our Association. We have a Cartage Contractors' Section, Char-a-banc Proprietors' Section, Hackney Carriage Proprietors' Section, and a Funeral Directors' Section. Each Section has autonomous powers with separate Committees which meet periodically for the respective business purposes, and Sectional Reports are presented to the Executive General Committee from time to time.

We have, on several occasions, opposed clauses in Bills presented to Parliament, with very successful results, and also have opposed suggestions in regard to Local Bills which have been considered detrimental to the interests of the transport trade. During the recent Parliamentary Session, my Association successfully opposed two clauses in the Birmingham Parliamentary Bill, and we have recently succeeded in influencing the Birmingham City Council to reject a bye-law put forward by the Public Works & Town Planning Committee.

I am fully convinced that the respective trading organisations which have been formed to protect the transport industry have done yeoman service with regard to the improvement of the transport industry, and such organisations through diplomatic negotiations are generally successful in procuring satisfactory results and avoiding conflicting experiences between administrative bodies and members of the transport trade. I attribute much of the improvement to the great assistance your paper has given in conjunction with local and general assistance, and sincerely hope that further developments of a like nature will be forthcoming in the future.

Traffic Control by Light Signals.—Memorandum No. 297 (Roads), issued by the Minister of Transport, deals with the subject of traffic control by light signals, which has been prepared by the Ministry, in conjunction with the Home Office and the Scottish Office, as an indication of the considered views of these Departments as to the lines upon which any developments of traffic control by light signals should proceed. Great importance is attached to securing that installations of this nature should be uniform in character throughout the country so far as local circumstances permit. The further question whether grants from the Road Fund could be made towards the installation and maintenance of such signals, erected with the express approval of the Ministry, is now under consideration, and it is hoped that it will be possible to issue further information dealing with this point at an early date. The present Memorandum is being issued without waiting for the decision in the matter of the grant in view of the fact that applications have been received from a number of authorities for guidance in the matter from the Departments concerned, and it is understood that some authorities have been postponing action pending the issue of definite instructions. Copies of the Memorandum can be obtained from H.M. Stationery Office, or through any bookseller, price 3d. net.

Use of Horns.—Steps are being taken by the Royal Automobile Club to give effect to the expressed opinion of the Conference on Road Traffic Noises and Priority of Traffic at Cross Roads, in connection with the use of motor horns. The Conference, which included representatives of the Ministry of Transport and a large number of official and unofficial bodies representing the road user, stated that "much might be done if strong representations were made through the motoring organisations to the manufacturers and to the motoring public at large, drawing attention to the annoyance caused to the general public, particularly in urban areas, during the normal sleeping hours, and urging them not to use those horns with a very strident and disturbing note, and to reduce the use of all types of horn to occasions where it is really necessary in the interests of safety." The law relating to the use of motor horns is defined in Article IV 5, of the Use and Construction Order, 1904, which reads as follows: "He shall, whenever necessary, by sounding the bell or other instrument, required by Section 3 of the Act of 1896, give audible and sufficient warning of the approach or position of the motor car." The R.A.C. points out, however, that compliance with the law may be made on this point without annoyance to the public, since a motorist who drives carefully finds that the necessity to use his horn rarely arises.

The Furniture Warehousemen and Removers' Association.

By Victor Brown, J.P., C.C.

First Honorary Secretary and Present Treasurer.

Replying to your request that I should write some account of how the Furniture Warehousemen & Removers' Association came to be formed, and other matters which may be of interest:—Early in the year 1900, Mr. L. Byng Hall, who was then Managing Director of the Pall Mall Deposit & Forwarding Co., Ltd., suggested to me that it would be a good idea if an Association were formed in the removal trade, similar to the American and German Associations, and as he thought I was the only one who knew the members, as the only opportunity the trade had of meeting their competitors was, he said, when they met on the doorstep of a house to estimate, he asked me to call a meeting of my friends in London to talk over the matter, and he kindly consenting to place the offices of the Pall Mall Deposit & Forwarding Co. at our disposal for a meeting. This meeting was held, and Mr. L. Byng Hall put forward his ideas which met with warm approval. I was then asked to invite the leading firms in the country to attend a meeting, as I had come into personal touch with the trade, as in those days I used to see the members frequently. The outcome of this was that it was decided to have a general meeting of the members in town and country to discuss matters of interest and decide as to the advisability of forming an Association. With this object a meeting was held on May 3rd, 1900, which was very representative of the trade. Mr. L. Byng Hall presided, and after I, acting as Hon. Secretary *pro tem.* had read a large number of letters received from members of the trade in all parts of the United Kingdom in thorough sympathy with the objects of the meeting, Mr. L. Byng Hall explained the ideas of the Association. He mentioned the fact of his being a member of the German and American Kindred Associations which exercised a very great influence over their trades with the most excellent results. From his experience of those Associations he was confident that an Association in the United Kingdom would prove beneficial in every way, and he strongly recommended that one be formed. Mr. Hall then asked Mr. F. Tapner (Messrs. W. Whiteley, Ltd.), to address the meeting. Mr. Tapner pointed out that the trade had increased and was increasing greatly all over the country, that a very large capital was invested in buildings, vehicles, plant, etc., that competition was keener, and that it necessarily followed the public did and would take advantage of such competition. Customers were more exacting and less honorable as competition grew, and they now made the most trivial claims which were never thought of years ago. He considered that the Association, if formed, should at once discuss the desirability of formulating a standard of liability, which could be adopted by the trade generally. At the present time the question was in a chaotic state, and contractors were liable for anything and everything. There should not be any great difficulty in arriving at an understanding on this subject.

MR. VICTOR BROWN, J.P., C.C.

Then there was the important question of the right of lien. This was most unsatisfactory for warehousemen and also for removers, and in the future, with increased complications, it would prove a stumbling block. This could only be removed by legislation, which he was sanguine enough to believe would be possible should the Association be powerful enough. The members of the trade should see to this.

He could also foresee increased demands on the part of the Railway and Insurance Companies. The former were already feeling the pinch of increased expenses and were considering how to recoup themselves. In his opinion the trade would be selected for increased burdens, as was the case during the revision of the rates some few years before. He thought the Railway Companies should rather reduce the rates and thus divert into the hands of the trade (which gave the Railway Companies so little trouble) that business which they themselves did so badly and for which they had to pay heavily in the way of claims for damages.

The Insurance Companies were also very exacting.

Labour was another factor which would have to be reckoned with.

In concluding his remarks, Mr. F. Tapner said all these combinations could be better met by combination, and he very strongly felt that the proposed Association was needed and that it would, if formed, be found to be of the greatest assistance to the business of warehousemen and removal contractors.

A discussion followed in which Messrs. H. Day (Harrods, Ltd.), J. A. Evans (C. & G. Ayres), Wm. Boote (Wm. Boote & Son), W. H. Buncombe (C. Taylor & Sons), — Hibbard, Peter Bendall (Barnby Bendall & Co.), Ben Purser, W. H. Payne (Payne & Birdseye), took part, the last gentleman suggesting an estimate form be made out by the Executive Committee for the use of the Association and submitted to the Members before adopting. This suggestion met with warm approval from the meeting.

It was then proposed and seconded and agreed to that an Association be formed and called The Furniture Warehousemen and Removers' Association. This resolution being put to the Meeting was carried unanimously.

Sir John Blundell Maple, Bart., M.P., was elected President, Mr. Albert Taylor, of Messrs. Walter Taylor & Sons, Pimlico, Vice-President, Mr. L. Byng Hall, Honorary Treasurer, and I was elected Honorary Secretary. A Committee was also elected and the annual subscription was agreed to be £1 1s. 0d.

Among others present at the Meeting were:—Mr. F. W. Burdock (John Barker & Co., Ltd., Kensington, W.), Mr. Tom Batchelar (Batchelar & Sons, Ltd., Croydon), Mr. W. Nicholls (Hampton & Son, Ltd., Pall Mall), Mr. J. R. Comfort (Jones Bros., Holloway), Mr. A. Pope (Pope & Son, Hammersmith), Mr. W. Holland (J. Shoolbred & Co., Tottenham Court Road), Mr. G. Opie (J. J. Allen, Ltd., Bournemouth), Mr. J. E. Carter (Walter Carter, Manchester), Mr. A. Curtiss (Curtiss & Sons, Ltd., Portsmouth), Mr. F. Brown (Bridges & Co., Folkestone), Mr. Peter Bendall (Barnby, Bendall & Co., Cheltenham), Mr. J. A. Smyth (Beverley, Smyth & Co., Dublin), Mr. A. Currie (Currie & Co., Newcastle-on-Tyne), Mr. T. H. Gilley (Farrant & Co., Torquay), Mr. Alfred Peace (Alfred Peace, Bridgwater), Mr. F. Winwood (W. Winwood & Son, Worcester), Mr. A. Hewitt (White & Co., Ltd., Southampton). It was agreed that the Annual Meeting should be held about the middle of May in each year.

At the conclusion of proceedings, an impromptu Dinner was held at the Florence Restaurant, Rupert Street, at which Mr. W. H. Buncombe presided.

May 3rd, 1900, was an important day in the removal and warehousing trade, when the Association was formed to be of general use to the members of the trade, and not, as a good many think, the trade for the Association. I sometimes wonder whether this is really understood, and if some of the members are not more keen to take more out of the Association than they put into it. I have since been told by some that they were glad to be members of the Association because the cartage they got from other members paid their subscription times over. This is not the true spirit that should obtain. I have been at times very disappointed with the results of the many years of labour by leading men in the trade, who had nothing to gain by being members, who have done their best for the general good.

Digitized by Google

I have frequently heard of firms taking goods from another depository under some excuse or other, where in nearly all cases there was no real reason whatever. Alternatively, I am glad to know that most of the firms stand very loyally to the recommendation of the Association.

With regard to the Centres, some of these are doing splendid work and carrying out local arrangements in a very straightforward manner and which is satisfactory to all. In other Centres, there seems a very great lack of interest and no cohesion. What has been done in some places can be done in the others. All should work together for the mutual good. The keynote of the Association is that there should be mutual confidence all round if the Association is to be a thorough success and looked up to by the trade generally. This can be done if each individual member would do his best to uphold the objects of the Association.

I have before me a copy of the first Year Book issued, which contains about 90 to 100 names. There are to-day over 800 members.

I should like to say a word with regard to the past Presidents.

Sir John Blundell Maple, the first President, was unable, owing to pressure of Parliamentary and other business, to give much time to the Association. Mr. Albert Taylor, of Messrs. Taylor & Sons, Pimlico, presided at nearly all the meetings of the first year and was President the following year, and to him, who was always courteous and helpful, the Association owed much for his guidance through the difficult early stages. He was followed by Mr. J. E. Carter, of Walter Carter, Manchester, who took a warm interest in the Association and was very active in furthering its objects. He was followed by Mr. F. Tapner, who was so well known and who will be always remembered as one of those who showed prominently in the prosperity and continued success. He was followed by Mr. Archibald Currie, of Currie & Co., Newcastle-on-Tyne, a fine type of North Country gentleman and a firm friend. The memory of Mr. Arthur G. Dixon is still fresh in the members' minds and will never be forgotten for the very great interest he took in the Association and always ready to help members. Mr. Alfred Peace, J.P., of Bridgwater, had a very important year of office in 1906-1907, and did a great deal to strengthen the Association. Mr. H. Day, of Harrods, Ltd., was the next President. He is so well known as one of the pioneers of the Association, and it was a great loss to the Association when he retired into private life. Mr. W. R. Peppiatt, of Chaplin & Co., was the next President, and owing to the enormous amount of work he did for the Association and important matters in hand, he was unanimously elected to serve for a second year. He was followed by Mr. Ben Purser, of Southport, who always took a keen interest in the Association. Mr. F. Walter Payne followed in 1912. Always an enthusiast of the Association and a great help from the start, his work will always be remembered by the older members and it is a matter of general regret that he does not get the opportunity of being present nowadays at the meetings as formerly. Mr. F. J. Godden, J.P., will always be remembered for his services, and a man who endeared himself to all the members. It is a very pleasing fact that Harold Currie, J. Godden and Arthur J. Dixon, the sons of former Presidents, have each occupied the same position and have upheld the reputation and usefulness of their fathers. Mr. E. H. Beckwith, of Pickfords, was of valuable assistance to the Association as President. Mr. Ben Blower, Mr. A. J. Waters, and Mr. A. J. Burrows, each served their year with great credit to themselves. Mr. C. Stanley Hudson was a very useful President, and it is deplored that he is seen so rarely now at the meetings. Mr. George Opie, of J. J. Allen, Ltd., Bournemouth, was a very respected President and a very great help to the Association. Mr. H. Mayes, of White & Co., Ltd., is well known to the present generation for his splendid services to the Association and untiring efforts for its success. Mr. Evan Cook was elected in 1922, and did good service to the Association. I often think that the experience he gained in the Association has fitted him for the more active participation in public affairs of London in which he now takes so leading a part. Owing to the valuable services of Mr. G. H. Price, of Mousell Bros., Ltd., he was elected President for two years. All the members of the Association greatly appreciated his guidance and assistance. Mr. R. J. Armstrong was President in 1925. He, again, is so well known among the members that it is unnecessary to add anything beyond to say that he is a great enthusiast for the Association and its success. It is deplored that the serious accident he had in June last has kept him away from business so long, but it is very satisfactory to know that he is now beginning to get about again. Mr. J. R. Harris, of Tunbridge Wells, was an excellent President and untiring in his efforts for the success of the Association. As a member of the Finance Committee, his services are invaluable. The Presidency of Mr. G. H. Good (J. J. Allen, Ltd.), of last year is of so recent a date as to be fresh in the minds of everyone. Always courteous and kindly, he gave an enormous amount of time to the work of the Association. His marriage taking place in the year of his office, the members had an opportunity of expressing their appreciation of his services and they hope that he will have many years of happy home life and that the Association for a long time to come will have the benefit of his services.

No one but those who came in close contact can really appreciate the fine services the Presidents have devoted to the interests of the Association.

It is a melancholy fact to record that 13 of the past Presidents have passed away.

Members will remember that Mr. L. Byng Hall was offered the Presidentship on several occasions, but he preferred to remain on the Committee. He will always be remembered as the originator of the scheme, and not only as the one who first suggested the idea of the Association, but the work he carried through to help make it a thorough success, and also for his kindness to all members who have sought and still seek his advice. Long may he remain as one of the pillars of the Association.

It may be of interest to members to know that the only member of the Committee who was elected in the first year of the Association who still remains on the Committee is Mr. Frederick Brown, of Bridges & Co., Folkestone, one who has been of invaluable help for many years past, but whose innate modesty will not allow him to seek higher honours.

For between 11 and 12 years I was Honorary Secretary, but owing to the enormous growth of work, it was felt the time had come when a Secretary should be appointed. Mr. Thomas Upton was elected Secretary and occupied that position from 1st July, 1911, to 30th June, 1927, when Mr. E. A. Harris was appointed Secretary.

The work of the Association was carried on from its inception in 1900, until July, 1911, at the offices of the Pall Mall Deposit Company, when offices were taken in Craven Street, Strand, which, after a good many years, occupation had to be given up as they were wanted for the owner's own use. The Association then removed to Russell Square, Bloomsbury, and then afterwards to the present address in Arundel Street, Strand.

I understand the next issue of *The World's Carriers* will be the Birthday Number. I offer you my congratulations and every hope for its further success. Matters of interest to the removals and warehousing trade are so fully reported that its issue is greatly looked forward to by the members each month.

Nine-Language Trade Guide.—Following the practice of the last three years, an advance edition of the catalogue of the London section of the British Indusrties Fair is being prepared with a classified index to goods in nine languages. It will be ready on December 31st, in time for it to be in the hands of most overseas buyers before they leave their homes for the Fair, which is to be held simultaneously in London and Birmingham from February 17th to 28th. This advance edition will run to 11,000 copies.

World Agricultural Tractor Trials, 1930.—World Agricultural Tractor Trials, to be held next year under the auspices of the Royal Agricultural Society of England in conjunction with the Institute of Agricultural Engineering, University of Oxford, are being arranged, and entry for and particulars of the trials and tests may be obtained upon application to the Secretary, Royal Agricultural Society of England, 16 Bedford Square, London, W.C.1.

The Cartage Trade of London.

By R. P. Bailey.

Secretary, London Cartage and Haulage Contractors' Association.

THE London Cartage and Haulage Contractors' Association was founded in 1889, and its establishment was the direct result of the feeling which arose both in London and the provinces when the then Chancellor of the Exchequer, Mr. Goshen, introduced as an item of the Budget, a proposal to raise revenue by means of a "Wheel Tax."

This proposal had the effect of creating a sense of unity and mutual obligation in the cartage trade in London, and Mr. Samuel Taylor was the leading spirit in organising an opposition movement. He was ably supported by Messrs. G. J. Lloyd, J. Finch, C. E. Scholes, R. A. Kearsey, M. Fairclough, A. J. Willmott and others. Public attention was directed to the gross injustice of the tax by means of placards posted on the tilts and elsewhere of the trade vehicles, and the employment of public speakers. Their efforts met with success and the proposed tax was withdrawn.

The immediate outcome of this movement was a desire for the establishment of an organisation for the protection of common interests, and on the 10th December, 1889, after a preliminary meeting at 85 Tower Hill, a full meeting of the trade was held at The London Tavern, "with a view of ascertaining the feeling of the trade as to the desirability of forming an association for the purpose of watching over and protecting the interests of the trade." Mr. Samuel Taylor presided, and resolutions were duly passed, "That an Association of Master Town Carmen be hereby established and be called 'The London Carmen and Cartage Contractors' Association.'"

A council of 25 members was appointed, and it may be of interest to the trade if their names are recorded. The following thirteen members who had constituted the Provisional Committee were unanimously elected to the Council without ballot.

Messrs. H. Drapper, H. Evans, M. Fairclough, H. Fardell, J. Finch, R. A. Kearsey J. S. Lavington, S. Seaward, E. Smith, J. Smith, H. Smith, Samuel Taylor and A. J. Willmott.

Twenty-one other names were submitted for the remaining vacancies, and by resolution, the first 12 names were declared elected. They were: Messrs. W. T. Cook, C. Webster, W. Boyer, C. Oakley, H. J. Gardner, E. Bramley, J. J. Prior, C. Fardell, E. Roberts, C. Johnson, J. Maggs and G. J. Lloyd.

Mr. Samuel Taylor was elected President; Messrs. R. A. Kearsey, A. Willmott and S. Seaward, Vice-Presidents; Mr. Morrison Fairclough, Treasurer; whilst Mr. Archibald White acted as Secretary.

Under such excellent auspices, the Association embarked upon its career. In its earliest stages (February, 1890), it was called upon to deal with a manifesto issued by the London Carmen and Dock Labourers' Union which instructed its members: "To refuse to load or unload any vans for non-union carmen and to refuse to work with any non-union carmen."

Whilst this manifesto caused some alarm, the employers took immediate action in countering it by informing their men that so long as they satisfactorily fulfilled their duties they would not be discharged. No serious consequences ensued, but there was undoubtedly a feeling of unrest existing, and the tactics of guerilla warfare were sometimes adopted by the striking of individual firms.

The Men's Union made persistent efforts to gain recognition, but they were invariably met with a refusal by the employers. Much dissatisfaction, however, existed amongst members of the Association at the disparity in the wages paid to carmen and rate cutting was rampant. There was no accepted scale of wages nor any limits to the number of hours a man should work. These conditions prevailed for several years and great difficulty was experienced in maintaining organisation.

When, therefore, the Transport Workers' Federation, in July, 1911, "in view of the present unrest," made application for a deputation to be received to discuss proposals forwarded by the London Carmen's Trade Union, the request was readily granted, in the belief that something definite and concrete would emerge in the nature of fixed wages and working conditions which would be rigidly enforced by the Federation on all master carmen, and a sub-committee from the Association was appointed to meet them.

The two parties met on August 1st, 1911, and after a short discussion they reached a measure of agreement. An advance in wages was conceded, but there was difficulty in getting agreement to the 72 hours week and payment of overtime. The Employers agreed to recommend acceptance, and the Union's representative asked that if these terms were acceptable to the Union's executive, could they come into force as from Monday next. The Employers pointed out that the following Monday was Bank Holiday, and it would be impossible to arrange a meeting of the masters prior to that date, but that they would submit the proposals to a meeting not later than Thursday, August 9th. There was no indication that a strike would be precipitated, but the men did not present themselves for work on the Tuesday following Bank Holiday, a strike having been declared.

On Thursday, August 9th, a meeting of the trade was convened, and the whole position reviewed. The sub-committee was given authority to make a settlement with the men's representatives on the lines which had been already submitted. According to prior arrangement, the committee met the Union representatives that same evening, and after prolonged discussion, lasting until 2 a.m. the next morning, an agreement was reached fixing the wages of a single horse carman at 27s. for a 72 hours week, and not more than 14 hours in any one day, and overtime at 6d. per hour, and on these terms work was resumed. The agreement did not meet with entire approval.

Difficulties began to arise again over the question of the non-union man, and even in the employers' ranks there appeared to be dissatisfaction that that particular section of trade had not been represented on the committee which met the men's representatives.

Several meetings were convened at the instance of members who complained at the fixing of the 72 hours week, and the payment of overtime. Others complained that a large number of the master carmen were working at the old rates, and it was impossible to resist their competition. Many representations were made to the Carmen's Union, and a sub-committee informed the Transport Workers' Federation that unless the agreement was more generally adopted it would be impossible for the firms who were conforming to the agreement to continue. They received an assurance from the Federation that they would use all means in their power to enforce it.

The agreement was embodied in the rules of the Association making the adoption of that schedule a condition of membership. It was manifest, however, that the loyalty of members was being put to a severe test. In March, 1912, the men's Union was again approached on the question of non-compliance, but only promises of assistance were forthcoming.

In May, 1912, there were all the signs of an imminent dock strike. The unrest which had been simmering for years appeared to have reached boiling point. The Association appointed a strike committee to make preparation for emergencies. Fodder was purchased, and the protection of the police was solicited to ensure that the horses should be properly fed and attended.

On the 22nd May, the President was called to a meeting at the Board of Trade at which the union officials were present relative to a strike at Mr. Bissel's yard. They repudiated any official connection with the strike and re-iterated their desire to maintain the 1911 agreement and its recognition by all master carmen.

On this same date the lightermen struck by refusing to work with unlicensed men and the dockers came out in support, demanding the recognition of the federation ticket and the employment of only union men. The call to strike had not been made to the carmen, but their sympathy with the dockers was shown by their refusal to load goods at the docks, which, under other circumstances, would have been lightered. This led to the dismissal of employees and a demand from the union for a re-instatement. The position of the master carmen was an exceedingly delicate one. There was no official strike in the trade; yet the government, in its several attempts to set up machinery for a settlement, endeavoured to bring in all sections of the transport trade. The Association steadfastly declined to be a party, on each occasion, on the grounds that they had no dispute with the Federation, and that they were prepared to abide by the 1911 settlement, but in their own meetings they resolutely determined to resist the enforcement of the federation ticket if that demand was made upon them.

The strike failed about the middle of June, and after the resumption of work, Sir George Askwith invited representatives of the trade to give evidence before the Industrial Council;

(1). As to the best method of securing the due fulfilment of Industrial agreements.

(2). How far and in what manner Industrial agreements should be enforced.

Digitized by Google

The Association advocated the granting of statutory force to voluntary agreements, but no positive results followed the enquiry. The Association has been consistently persistent in this policy, and urged its adoption during the war troubles and before the Royal Commission on Transport which was set up in 1928.

The danger of contagion to horses of Glanders and Farcy occupied the continuous attention of the Council from 1892 onwards. Numerous interviews are recorded with the Board of Agriculture and the City Authorities, particularly to urge the closing of public water troughs and the erection of stand pipes.

The Glanders and Farcy Order, which came into operation in 1907, was far from satisfactory to horse owners, although the scale of compensation was a decided advance on former orders. In 1913, a petition was signed to the Board of Agriculture urging that in order to stamp out this disease, it should be compulsory for every animal to be subjected to the mallein test by a veterinary surgeon approved by the Board of Agriculture, and also that full value should be paid for all animals which responded to the test and were slaughtered. This petition was supported and signed by several of the Railway Companies and Transport Associations throughout the country.

In the field of legislation, the Association has an excellent record. In 1907, the London Brighton and South Coast, and the London and South Western Railway Companies sought power to engage in general cartage work. At the outset, the L.B. & S.C. Rly. contested the Association's right to appear against the Bill on the grounds that it had no *locus standi*, but the Court of Referees decided against the Company's contention and granted leave to appear. On consideration of the Bill before the House of Commons, the Committee amended it by limiting the companies' powers to the cartage of rail-borne goods only. As a consequence of this decision, the L. & S.W. Rly. offered to modify the cartage clause in their Bill so as to restrict their cartage to non-rail-borne parcels and to exclude the area within a radius of 25 miles of Charing Cross. Whilst this would have met the immediate objection of master town carmen, the Council considered it would be a dangerous concession, and they accordingly refused to accept the modified clause, and instructed the Council to oppose it. However, on the day prior to the hearing of the Bill before the Committee, the Company withdrew the cartage clause, and the Association thus recorded its first success in its many battles with the Railway Companies on this point.

Two other Bills of a similar nature were then pending, and these also were successfully resisted as were others of a like nature which followed in later years.

In 1928, however, in consequence of the development of motor transport, the railway companies made common effort to secure these powers. The Government set up a Joint Committee, and after sitting for 30 days in practically continuous session, general road carrying powers were granted. It is interesting to record that the charges incurred in 1907, by the employment of counsel, fees, etc., were £168, whereas in 1929, the costs amounted to £4,250.

The work of the Association in the matter of legislation was not confined solely to railway matters. It was active in the Trade Disputes Bill, which legalised picketing, and relieved trade unions from liabilities in consequence of the illegal acts of their agents, the Workmen's Compensation Bill, and a host of others.

The Vehicles Lights Act, providing for the carrying of lights upon every vehicle after sunset was first introduced in 1893, and the Council circularised the trade and Members of Parliament, pointing out "the uselessness and danger of such regulations as applied to our own well lighted towns and cities," and, as a result of these representations, the introducer of the Bill promised to exclude from its operations the precincts of well lighted towns and cities. In October, 1898, however, under a bye-law of the L.C.C., a police order was issued making the carrying of lights compulsory.

Van robberies were exceptionally numerous in the early years of the Association. The Council adopted all kinds of measures with a view to checking them, and the services of private detectives were engaged. One persuasive gentleman named "Moses," informed the Council that, "providing the necessary funds were forthcoming," he had no doubt that he could succeed in tracing and convicting receivers. His eloquence undoubtedly convinced the Council as to his ability, and he was engaged for three months at a remuneration of £10 per week and £20 on each conviction, at the end of which time he had nothing to report, and the Council immediately dispensed with his services. Two inspectors—retired police officers—were engaged, and some measure of success attended their efforts, but severe complaints are recorded that not only were the authorities very lax in dealing with these cases, but they refused assistance and information to the Inspectors.

In 1909, a petition was lodged by the Association against the City of London (Street Traffic) Bill, and a deputation from the Council attended before the County Purposes Committee and presented their objections to certain clauses of the Bill which would have prohibited all loading and unloading from vehicles by means of cranes and pulleys between the hours of 8 a.m. and 6 p.m. As a result of these representations, the Council agreed to delete the objectionable provisions of the Bill so far as they related to merchandise other than coal, coke and beer casks.

By a decision of Judge Bacon, under the Workmen's Compensation Act, it was held that tips received by a carman, in addition to wages paid by his employer, must be considered as part of the carmen's wages derived from his employment, and compensation under the Act was awarded on that basis. The Insurance Company held that the decision was wrong, and the Association contributed a sum of £50 towards the expenses of appeal.

The appeal was unsuccessful and the Insurance Company having in the interim failed, the costs incidental to the appeal had to be met by the firm of contractors, but they were reimbursed by the Association.

Up to the year 1905, mechanical transport had made little or no appeal to the trade generally, but there was a movement by another Horse Owners' Association to approach the Local Government Board for more stringent regulation;

(a). As to speed limits.
(b). Prohibiting the emission of sparks, steam, etc.
(c). Prohibiting of trailers.
(d). The exclusion of heavy motors from the more important thoroughfares.

The master carmen were invited to join in the memorial, but the President pointed out that master carmen might, in the future, be heavy motor owners themselves, and that as the District Council had proposed to reduce axle weights from 8 to 6 tons, and the speed from 8 miles to 6, this would, for the present, meet the views of the Association.

I have confined this record to the pre-war period. Space will not permit of the work of the Association during the period of the war and from 1919 onwards, although these were the most important stages of its work.

The record, however, would not be complete if reference were not made to some of the personalities.

Mr. Samuel Taylor was the first President and real founder of the Association. He continued in the Presidency until the year 1905, and his high character won the admiration of everyone. On relinquishing the office of President, the following resolution was inscribed on vellum and presented to him as a slight token of the esteem and regard in which he was held by the members. "That the warmest thanks of the meeting be and are hereby tendered to him for the invaluable services rendered to the trade generally and for the urbanity, impartiality, invariable courtesy, tact and ability displayed by him as President of the Association and Chairman of the Council."

Mr. R. A. Kearsey was elected his successor, and he was President from 1906 until 1915. His period of office had been an exceedingly onerous one, and he won the esteem of the members by the abilities he displayed, particularly in dealing with the labour troubles of 1911 and 1912, and for the services rendered in the first year of the war.

His successor was Mr. G. A. Dutfield, J.P., who held the office from 1915 to 1926. It is impossible to measure in words the volume of work which Mr. Dutfield undertook on behalf of the Association, and the demand it made upon his time and energies during the war and post war periods. He showed exceptional ability and tact in guiding the Association through those troublesome times, and none will deny that his work stands pre-eminently above all others.

Mr. P. R. Turner followed Mr. Dutfield in 1926, and still retains the office of President. His period of office, although comparatively short, has been full of activity. His services during the general strike were of inestimable value both to the country and trade generally. He showed a masterly knowledge when giving evidence before the Joint Committee, in opposing the Railways Bills, which won a commendation from the leading counsel for the promotors. In his submission to the Royal Commission on Transport, he exhibited a broad outlook, and there can be little doubt that if his suggestions are adopted, the future will hold a better prospect for the road transport industry. His many other duties have been discharged with an ability which has won the admiration, not only of the members of the Association, but of the trade throughout the country, and the prestige of the Association has never stood higher than it has under his direction.

The Furniture Warehousemen and Removers' Association.

Present and Future

By E. A. Harris.
Secretary, Furniture Warehousemen and Removers' Association.

In responding to your request for a statement as to the present position and future prospects and development of the Association, it is appropriate to embrace the opportunity to tender to you cordial thanks and appreciation for the support you have extended to the Association over a period of a quarter of a century, and to ask you to accept the heartiest congratulations of the Members on the occasion of the celebration of your Twenty-Fifth Anniversary.

What then is the present position of the Association? To render easy a realisation thereof it may first be stated that the transaction of its business occupies the attention of at least two general meetings each year, about 80 committee meetings and a large number of Centre Meetings. Its activities, as will be appreciated, cover a wide field of operation, and it may truly be said that in adolescence it retains the enthusiasm and progressive spirit which have been a feature of its work from the commencement. But the indication which has been given of the extent of the Association's deliberations requires to be supplemented by some statement of what is actually being done, and the following account could be considerably increased as it is by no means complete.

MR. E. A. HARRIS.

The Association, from its commencement, has rendered distinct service to the Industry in stabilising conditions of contract, and this is still one of its primary functions. One can easily visualise the confusion there would be if the conditions did not exist. Through the Joint Industrial Council for the Furniture Warehousing and Removing Industry the relations existing with employees are cordial and this is beneficial to both sides. The Association is recognised by Government Departments, Insurance, and other bodies, as the mouthpiece of the Industry. There are an ever-increasing number of matters which require watching and representation, and the Association never hesitates to act in the interests of the Industry. Railway Companies recognise the Association as the medium for negotiations in regard to rates, services, etc., for removals by Rail. Special Insurance facilities have been arranged for Members. The relations between Members are cemented in many ways, apart from the opportunity for coming together and arriving at understandings in regard to matters of common interest—to mention but one example: It is the practice of Members to utilise the services of other Members when requiring assistance. The Association's Employment Bureau performs very useful service, and the Benevolent Fund, established three years ago, continues to develop.

Every industry is realising more and more the necessity for specialised education and the spread of information regarding every aspect of its activities amongst its Members, in order to improve its services to the community to the ultimate benefit of its Members as well. In accord with this movement Examinations are held by the Association for the staffs of Members, and Educational Classes are held after Centre Meetings. All this work is for the good of the Industry and the community it serves. It may also be mentioned that an indenture form suggested for use by Members when engaging apprentices is at present under consideration, which marks another intended development in the educational work.

What then is the future of the Association? The past and present is imperishably engraved therein. Development is, however, in the natural order of things, and the Association is still forging ahead. With its progressive potentialities it is confidently anticipated that step by step it will go forward.

It is not, however, too easy to speak of actual directions in which it will develop. Such of the Association Centres as have not long been established are bound to strengthen, and the Association is urging the formation of Town Units of Centres where such do not at present exist. In an endeavour to improve still further the general condition of the trade, a pamphlet is being issued dealing specially with Costing of Road Motor Vehicles in the Industry, and the influence on the future will, it is hoped, be beneficial. In furtherance of the promotion of its objects and the interests of the Industry the Association registered a design which may shortly be available for use by Members, in suitable form, the aim being to associate more than ever in the mind of the public the idea of quality of service in furniture removing.

Not only economic and similar factors, but legislative enactments, have to be carefully observed in framing policy to be adopted, and much, therefore, depends upon circumstances which may arise, not directly under the control of the Association or Industry. It is only necessary to mention the changes which may result arising out of the Reports of the Royal Commission on Transport, to which the Association, in the course of its evidence, put forward many suggestions in the best interests of the Industry.

The work which the Association has already done will be cumulative in its effects and be beneficial in the future, and though the Association is very representative, there are, of course, still some firms who are not indentified with it. As the work done, and to be accomplished, benefits the Industry generally, it is felt that the Association should receive the support of every legitimate furniture warehouseman and remover.

It may safely be asserted that, as in the past, the Association will continue to look after the interests of the Industry and promote them in every possible way.

Shipping and Forwarding in Liverpool.

By S. L. Jude.

Secretary, Liverpool Shipping and Forwarding Agents' Association.

TWENTY-EIGHT years ago, *i.e.*, 30th September, 1901, a small body of business men met in an hotel in Liverpool and founded the Liverpool Shipping and Forwarding Agents' Association. Since that day, in spite of the unsettling effect of the Great War and trade depression, the Association has steadily progressed in numbers and influence. To-day its original membership has been almost quadrupled, and the prestige of the Association has never been higher.

In 1920 the Association was incorporated and now occupies a very important position amongst the trade associations of the United Kingdom. The objects as outlined at the original meeting in 1901, and subsequently confirmed in 1920 are briefly:—

"To promote and protect the interests of trade in general, and of the Liverpool Shipping & Forwarding trade in particular, and to consider all questions relating to the interests of trade, and especially so far as they relate to or concern the Liverpool Shipping and Forwarding trade, and to take such action therein, and promote such measures as the Council of the Association may think expedient.

To act as a representative body, and as such to communicate with Public Authorities, Parliamentary Committees, Chambers of Commerce, Railway Administrations, Steamship and Sailing Ship Companies, or other public bodies throughout the World.

To apply for, or support applications for Acts of Parliament or Provisional Orders or other measures which may be considered desirable for the purposes or in the interests of the trade, and to oppose any applications for Acts of Parliament or Provisional Orders which may be considered likely, directly or indirectly, to injure or interfere with or prejudicially affect the trade, and to take all such steps as may be deemed necessary or expedient for conserving, protecting and promoting the common interests of the Shipping and Forwarding trade."

MR. S. L. JUDE.

In carrying out its objects the Association has frequent dealings with other branches of the transport industry, and the relations between the Association and the railway and steamship companies, amongst others, are very cordial. In this connection the words used by the first President of the Association, at the first Annual Dinner, are of interest, and equally true at the present day:—

"Speaking as a steamship manager, after many years' experience, he could truly say that the interests of the steamship owner and the forwarding agent were absolutely identical. The steamship companies owed a debt of gratitude to the agents that was difficult to measure. The forwarding agents represented, to a great extent, the intelligence department of the steamship line. They gave much of the business that the companies had; they were the eyes and ears of the shipping trade, and they did much to prevent that diversion of trade from Liverpool to other ports that was threatened so often."

It is indicative of the close relationship between the Association and other bodies, and their desire for its support, that the Association is directly represented on three Committees of the Chamber of Commerce, the United Trades' Association Committee, and the Railway Traders' Panel. Whilst preserving its complete independence, the Association works in close co-operation with similar Associations both at home and abroad.

The Association is also frequently in correspondence with the various members of the Consular Corps, Government Departments, and similar Associations not only in this country but also overseas, enquiries being received from all parts of the world.

To carry out the considerable amount of work involved, the Association has a President, an elected Council of twelve members, and a part-time Secretary. This Council meets monthly at least, and a summarised report of its labours are sent each month to every member of the Association. This idea was only inaugurated a few years ago, and has been very warmly welcomed by the members, as is evidenced by the keen interest shown in these monthly circulars, and the numerous enquiries made regarding the matter contained therein.

The Association not only acts on behalf of its members with outside companies or bodies, but as mediator between members on points of dispute.

The social side is not overlooked, and the Annual Dinner is one of the most successful and important functions of its kind in the port. It is usually attended by representatives of the leading Shipping Companies, Railways, Consular Corps and Government Departments, and for the past few years the Lord Mayor has also accepted an invitation to be present.

As the representative of exporters and importers all over the United Kingdom and overseas, the forwarding agent has a great influence in the development of the Port of Liverpool. He is usually on far more intimate terms with merchants and manufacturers than steamship companies and carriers. There may be people who still question his necessity, but the close and unprejudiced interest taken by the agent in his client's welfare, his knowledge of the constant and inevitable changes in the conditions of the Port and Port Services and Consular Regulations, the necessity of freedom of choice of routes and lines, and the economy effected by means of grouping consignments, all demonstrate the justification of the shipping and forwarding agent.

Individually, the agent can do much, but combined, he can do a great deal more; hence the reason for the foundation of this Association, and its present strength and importance.

Liverpool Cartage Trade.

By Allen Walter.

Secretary, Liverpool Cart and Motor Owners' Association.

THE Liverpool Cart and Motor Owners' Association has a practically unbroken history dating back to the year 1750, when the cartowners of the port formed themselves into a company. This company was reconstructed in 1815 and was superseded in 1871 by the present Association.

The Liverpool Cartowners' Association was incorporated in 1891 and broadened its title to embrace motors in 1920.

In the year 1860, Mr. Thomas Roberts was elected President of the old Company of Carters, and his grandson, Mr. W. T. Roberts, C.C., is now the President of the present organisation, his father being President in 1890.

During its history the Association has been involved in many stirring and vigorously conducted campaigns, notably, in the old days, those for the abolition of the Van and Wheel Tax and the abolition of the Horse Tax. On many occasions in the early part of the present century, the Association also successfully petitioned against the inclusion of clauses in railway bills in respect of the carrying of goods by road.

About the year 1888, the late Mr. C. A. Still became the Secretary of the Association and held that position for 37 years, and during this long period the Association developed enormously. When he was appointed, mechanically propelled road vehicles were unknown, although not unthought of, but shortly before the dawn of the twentieth century, trials, which he attended, of heavy steam vehicles were held in Liverpool, which are now more numerous on Merseyside than in any other part of the country.

MR. ALLEN WALTER.

Many able and distinguished gentlemen engaged in the cartage trade have occupied high positions in the Association. As already mentioned, Mr. Thomas Roberts was Chairman of the Company in 1860. A subsequent Chairman was Mr. Robert Edwards (in 1888), father of Mr. William Edwards, now President of the National Road Transport Employers' Federation, and himself a President of the Liverpool Cart and Motor Owners' Association for a record number of years.

The objects of the Association include the protection and advancement of the common interests of its members generally by the constant and efficient watching of municipal, county or national legislation wherein any principle or point of practice affecting them may be involved; the obtaining and enforcing of rates for cartage; the making of arrangements and regulations for the terms of hiring of stock between and by members; negotiations with railway, steamship and other companies, and receivers and forwarders of goods regarding facilities, rates, etc.; the taking of all such steps as may be deemed desirable to enforce the adoption of a uniform scale of wages and of time and overtime; the obtaining of legal advice for members on matters concerning their business; securing the proper construction and condition of highways for traffic purposes; and all beneficial objects affecting the general interests of the members.

In the past, as now, considerations of mutual insurance as a measure of protection against risks run by cartage contractors occupied the attention of the Association, and in its offices are records of the old Liverpool Cartowners' Accident Insurance Society. This benefit was, therefore, at one time, an integral part of the work of the Association, but with the growth of risks it became necessary in subsequent years to make arrangements for cover for damage to goods and other risks by an insurance company. To this day the Association handles a considerable amount of insurance business, and thus maintains an unbroken record dating back to the year 1750.

The Association is thoroughly alive to its responsibilities in maintaining on behalf of its members its claim on traffic, and in 1901 took the initiative in installing an extensive telephone system, linking up the business centres, i.e., exchanges, etc., with the more important points on the quays where the traffic arises. The Liverpool Cartowners' Association was the first of the city associations to fully recognise the tremendous possibilities of the telephone for speeding up business and thus giving the maximum measure of satisfaction to its members and their principals.

Great as have been the achievements of the Association in the past, there is no intention of resting upon our laurels, and those who at present guide the destinies of the organisation are ever watching over the interests of the members, whose ideal is public service and to enhance the general good of all.

British Industries Fair, Birmingham.

EXHIBITORS and trade buyers alike will find important additions to the arrangements for their comfort and convenience at the forthcoming British Industries Fair to take place in Birmingham from February 17th to 28th, 1930. Among the developments for the 1930 Heavy Section is an entirely new building, now in course of construction, on the north side of the present 11-acre Fair. This will comprise a dining room specially for exhibitors, another for trade buyers, a large Conference Hall, and a series of private dining-rooms for the use of the numerous trade and professional societies and institutions which have made it their practice for many years to foregather at the Birmingham display. This year, for the first time in Birmingham, in response to requests from overseas and home buyers, an Advance Catalogue will be issued, giving particulars of the principal new or improved products to be displayed. A minimum of ten thousand free copies will be issued early in December to prospective purchasers of 1930 British-made goods, this being, of course, supplementary to the full classified Catalogue in English, French and Spanish, available at the opening of the Fair, giving details of the numerous services extended to trade visitors.

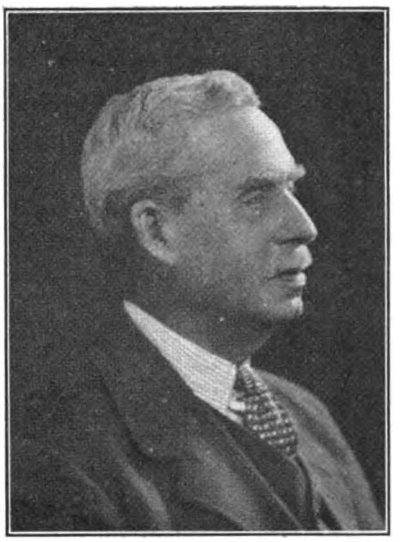
Transport in Ireland.

By A. R. Chapman.

Secretary, Dublin Carriers' Association

In Dublin, as in towns elsewhere, the question of transport facilities by road is becoming a problem which will have to be dealt with seriously in the near future, but owing to the adoption of mechanically propelled vehicles having been more recent than in England the problem is not quite so acute as it otherwise might be. It is, however, receiving the close attention of the Government and the Dublin Commissioners, and already considerable work has been carried out in improving roads and road surfaces, easing congested points, and providing police on point duty to regulate traffic at crowded and awkward crossings, while a number of places where space can be spared have been allocated for the benefit of the motoring public, where cars can be parked under reasonable regulations and where an attendant is provided to watch over them. This does not mean that the traffic problem in Dublin has been solved, as much remains to be done, not only in the provision of further facilities for the use of the roads, but by the issue of simple and effective regulations, and the education of the public in the observance of them, a certain section of whom, at present, are too inclined to be a law unto themselves, to the danger and inconvenience of other users of the thoroughfares.



MR. T. H. RICHARDSON, CHAIRMAN.

The fact that a considerable amount of the goods traffic in Dublin is still horse-drawn makes the question of road surfaces an important one, and one which is not too easy of solution, but by experiment and patience no doubt a suitable compromise will be evolved, while in the meantime all classes of traffic adapt themselves to the circumstances as best they may.

The Dublin carriers apart from passenger services are represented in Dublin by the Dublin Carriers' Association, an organisation founded in the year 1905 for the purpose of collective bargaining with the trade unions, settlement of disputes, and for keeping a watchful eye in general on all matters affecting the interests of its members, in which capacity it is from time to time in consultation with the Government, the Dublin Commissioners, the Police, trade organisations, and what not, for the furtherance of the common weal. It is a comparatively small but nevertheless an effective organisation and has for its Chairman, Mr. T. H. Richardson, whose portrait is appended, a well-known practical business man in Dublin, himself a carrier of no mean repute, and a popular figure among his fellow members in the Dublin Carriers' Association.

Street Accidents in Greater London.

The Second Report of the London and Home Counties Traffic Advisory Committee to the Minister of Transport on "Street Accidents in Greater London," in continuation of the earlier Report by the Committee on the same subject dated 10th March, 1927, is now on sale, and copies can be purchased from H.M. Stationery Office or through any bookseller, price 1/- net.

The growth of vehicular traffic in London during recent years is illustrated by statistics and diagrams based on the number of vehicles of the various classes passing certain busy traffic points on a selected day in each year, and the Report contains an analysis of the Police accident records for the years 1927 and 1928. The Report deals, among other matters, with the effect of "roundabout" and "one-way" systems of traffic working as regards accidents.

A notable feature of the Report is a map on the 6 inch scale showing the location of all fatal street accidents occurring in the years 1920-1928 inclusive in an area extending from Highbury in the north to the "Elephant and Castle" in the south, and from the Marble Arch in the west to Bow in the east.

The Committee urge that the utmost publicity should be given to the number of accidents and the circumstances in which they occur. With this object in view they recommend that a closer and more detailed investigation should be made into the circumstances of accidents than has hitherto been possible, and hope that the detailed examination now in progress of the features of all main thoroughfares from the point of view of accident causation will lead to an amelioration of present conditions.

Street Accidents to Children.

The Committee have also presented to the Minister of Transport a separate report on "Street Accidents to Children in Greater London." This report is also now on sale, and copies can be purchased from H.M. Stationery Office or through any bookseller, price 1/- net.

This report is based on detailed information relating to the street accidents causing the deaths of children in Greater London during the four years 1925 to 1928, and contains tables showing the time of year, time of day, district, age and sex of victim, type of vehicle concerned, and the circumstances in which the fatalities occurred.

Information is also given respecting the arrangements made for imparting instruction to school children upon traffic dangers, the extent to which children are protected against traffic dangers on their way to and from school, the arrangements made for the use of school playgrounds for recreation after school hours, and the provision made for playing spaces in the town planning schemes and the lay-out of housing estates.

The Committee consider that although accidents to children have not increased in the same measure as accidents to adults, increased efforts should be made to deal with those aspects of the street accident problem primarily affecting children. With this end in view they urge that the utmost publicity should be given to the records of accidents, and that parents and guardians should be warned of the greater liability to accident, as disclosed by the investigations made, of children between the ages of 4 and 9, and of the very real peril run by juvenile cyclists using public thoroughfares. The Committee urge that education and other local authorities should assist, so far as they are able, any movement to organise games for children in school premises after school hours. The Report also suggests that local authorities should endeavour to provide playgrounds for children conforming in number, size and distribution to the latest standards recommended by town planning experts.

London Omnibus Proprietors Meet the Minister of Transport.—A deputation from the Association of London Omnibus Proprietors waited upon the Minister of Transport last month and laid before him certain aspects of the omnibus position in London as affecting their members. The Minister promised to give the points raised consideration.

Municipal C.O.D. Parcels Delivery.—At the Tramways Committee of the Leeds Corporation, a letter was received from C. & A. Modes, Ltd., inquiring if the Committee was prepared to enter into an arrangement for the delivery of their parcels on the C.O.D. system on payment to the Committee of a commission in respect of the cash collected. The Committee authorised the general manager to make an arrangement with the Company for an experimental period.

Pioneer Commercial Motor Manufacturers.

THE ALBION MOTOR CAR CO., LTD.,
Scotstoun, Glasgow.

Founded as a private company in 1899 by two Glasgow engineers, the late Dr. (then Mr.) T. Blackwood Murray

A VERY EARLY ALBION VAN.

and Mr. N. O. Fulton, the Albion Motor Car Company has developed during the past thirty years from a small engineering shop in Finnieston Street, Glasgow, to a large limited company, the head office and works of which cover about ten acres at Scotstoun, near Glasgow, with over two thousand employees, while service depots and offices are established in London, Leeds, Manchester, Sheffield, Birmingham and Bristol.

The first Albion vehicle, an 8 h.p. car with a two cylinder horizontally opposed engine, was well in advance of its time, being equipped with magneto ignition. An Albion of this type was awarded a silver medal in the 500 mile reliability trial organised by the Automobile Club of Great Britain and Ireland in 1901 (now the R.A.C.). In 1902 Mr. John F. Henderson, B.Sc., joined the Albion Company, which was converted into a private limited liability company, and the following year the factory was moved to new works on the present site, and a new model with a 2 cylinder vertical engine and low tension ignition was put on the market. The manufacture of this model was continued with minor modifications up to the beginning of the war, and many examples are still on the road giving good service.

From the outset the Albion Company designed their vehicles to run on solid tyres, and the sturdy construction necessitated by this practice was largely at the back of the dependable service which these old machines provided. Further awards in open trials confirmed the Albion's reputation for reliability and aided the steady development of both the passenger and commercial vehicle sales. In 1907 Mr. H. E. Fulton joined the board to develop the commercial side of the business, and the company thereafter gradually transferred more and more of its attention to the production of commercial vehicles, till shortly before the war the manufacture of pleasure cars was entirely stopped, the firm concentrating on motor lorries, vans and buses.

The first Albion service depot was opened in London in 1910, in which year also the famous 4 cylinder 32 h.p. chassis was produced. The manufacture of this model was continued for no less than 16 years with great success.

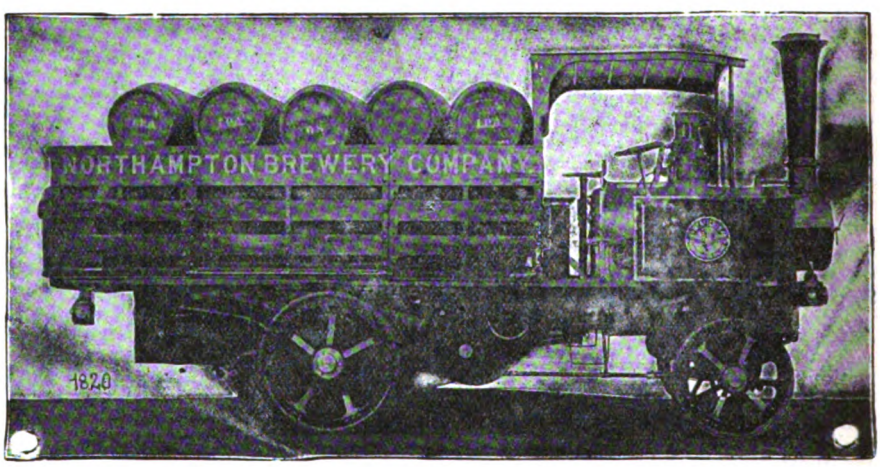
During the war the company supplied six thousand machines to the War Office, the whole of the works being engaged in the manufacture of vehicles and munitions for War Office requirements. After the war the steady development of the company was continued, and new models, embodying the Albion Company's experience, have replaced the older types. A considerable percentage of the Albion production has always gone overseas, and in 1921 the Albion Motor Car Co. (Australasia), Ltd., was formed to develop Albion business in the Antipodes. To-day there are more than thirty overseas governments and a correspondingly large number of private users, who employ Albion vehicles for their transport purposes.

Steady progress has been made throughout the career of the Albion Company, both as regards goods vehicles, buses and coaches, the Albion "Viking" coach being the fore-runner of the modern type of single-step touring coach. The company has pursued a steady policy of producing only the highest grade of machine, ever keeping a keen eye on the interests of users in the matter of running and upkeep costs.

To-day the Albion Company, as befits a pioneer firm, are in the fore-front of the commercial and passenger vehicle industry, the large numbers of repeat orders which they receive from old users being eloquent testimony that the reputation of their vehicles for reliability and low running costs is well maintained. Their range of vehicles to-day is a more extensive one covering goods vehicles from 30 cwt. to 5 ton loads, and buses and coaches of both 4 and 6 cylinder types with seating capacity of 26 to 32 passengers.

WILLIAM ALLCHIN, LTD.,
Globe Works, Northampton.

This old established firm were for many years mainly concerned in the production of traction engines but with the advent of the steam wagon the demand for the traction engine began to fall off rapidly. The demand for the steam wagon grew rapidly and engineering firms with experience in road transport took up their manufacture. Thus it was that the steam wagon eventually became the main production of the Allchin works. The vehicle illustrated was made in 1904 and was supplied to a local brewery. Its crude appearance as compared to the modern steam wagon is of much interest. The Allchin wagon of to-day is well known to haulage contractors as being a thoroughly dependable vehicle.



A 1904 ALLCHIN STEAM WAGON SUPPLIED TO A LOCAL BREWERY.

COMMER CARS, LTD.,
Luton.

It is now some 24 years since the company, now known as Commer Cars, Ltd., was first founded.

In 1905 a group of pioneers interested themselves in a series of experiments then being made with the Linley gear box, and after exhaustive tests with this component (which gave satisfactory evidence of its capabilities both

Digitized by Google

as a mechanical and a financial proposition) a small syndicate was formed and a factory opened in Clapham Road, London, where the first Commer industrial vehicle—a machine to carry 4-ton loads—was built.

In 1906 a plot of land was acquired on the outskirts of Luton, and on this site a small works was erected, and this formed the genesis of the modern extensive range of buildings which now constitute a conspicuous landmark to travellers on the main-line railway from St. Pancras.

The firm were unsparing in their efforts to prove that the motor vehicle was a sound proposition for the transport of goods and passengers and Commercial Cars, Ltd. (as the concern was then known) played a prominent part in meeting the requirements of the earliest users of road motors.

After developing their home markets the company conceived a bold and vigorous policy with the idea of introducing their range of products into overseas countries, and their enterprise was rewarded by the receipt of orders from all parts of the world. In addition to vehicles of conventional design, many machines built to meet special requirements were exported.

Amongst the orders to be seen in the books of this period was one for lorries fitted with straked wheels, which were sent to Patagonia. Engines equipped with power-hauling gear were despatched to New Zealand; vehicles running on steel tyres and provided with hauling drums had as their destination Siberia; char-a-bancs—somewhat different from the modern conceptions of these passenger vehicles—were shipped to the Canary Islands; whilst chassis specially designed to conform with the regulations governing mechanical traction in Ceylon and other Colonies were also constructed in the Company's works at Luton.

At the outbreak of the war the area of the Luton factory had been doubled, and its productive capacity correspondingly enlarged.

In the meantime Commer vehicles, in all forms of service, had substantiated the claims made by the makers for their products, amongst which was excellence of design allied with high-grade workmanship, and a wise choice of materials.

A four-ton Commer lorry of the R.C. type, built in

A 3/4-TON COMMER VAN—BUILT IN 1906.

1907, participated in the 1,000 mile trials organised by the Royal Automobile Club, with a view to ascertaining the durability and reliability of existing commercial vehicles. This machine completed trials without an involuntary stop, and was awarded a Silver Medal for its meritorious performance. Later in the year this vehicle was purchased by Lipton, Ltd., the well-known provision merchants, was used by them for many years, and has been credited with an enormous mileage.

With one exception all types of Commer vehicles from the commencement had been built for chain-drive transmission and equipped with the Linley semi-automatic gear box, operated by a horizontal lever located under the steering wheel. In 1914, however, the Company introduced additional worm-driven models in the design of which the Thomas gear box was incorporated.

When War was declared in August, 1914, the Company received instructions to standardise upon one type, the choice of the authorities falling upon the 4-ton chain driven R.C. lorry, for standardisation purposes.

The resources of the Company's works were concentrated upon the manufacture of this type until the cessation of hostilities, some thousands being supplied for various army purposes.

Then came the Armistice, and the Company was faced with the very difficult problem of re-creating a commercial business which had entirely disappeared. A very comprehensive range of models, comprising vehicles from 2 to 10 tons carrying capacity, or providing accommodation for from 16 to 46 passengers, was gradually evolved.

At first the heavier models employed final chain transmission, the Company having always been exponents of this form of final drive. But conforming to the march of progress, it was gradually given up in favour of worm drive. A particularly interesting and successful 3-tonner, employing head worm drive was the 3 P.G. model introduced towards the end of 1924.

The month of October of 1925 marked the beginning of a new epoch in the firm's development, when negotiations were concluded for the sale of the business to the old established motor manufacturing concern, Humber, Ltd., of Coventry. The economies resulting from an amalgamation of this sort and the pooling to a certain extent of the brains and resources of two such companies were reflected almost immediately in price reductions affecting the whole range of Commer products.

It is interesting to note that the Widnes Corporation had a fleet of covered top double-decked buses in 1909, mounted on Commer chassis. These were, we believe, the earliest covered top double-deckers in Great Britain.

At the Olympia Show in 1927 the Company came out with a complete range of new models, including a 30 cwt. chassis and a 2½-tonner, and the N4. and F4. low loading passenger chassis, all employing the new Commer high-efficiency engine which had been brought out to meet the demand for an engine giving a greater power output without increased weight.

To this range was added in 1928 a new 4-tonner, called the 4GN (normal drive) and the 4GF (forward drive).

In the passenger class there have been added more lately the 5P 20-seater chassis, and the 4PN and 4PF passenger chassis, intended to carry bodies capable of seating 26 and 32 passengers respectively.

Considerable attention is devoted to the question of overhauling users' machines, and the Company undertakes either complete or partial overhauls, both to chassis and bodies. In the case of a complete overhaul, a vehicle is entirely stripped, and the owner invited to send a representative to the works. This representative examines every part in conjunction with the Commer experts, and it is decided on the spot as to the replacements which must be made. An estimate of the entire cost of the job is then supplied within 24 hours of this meeting. Every unit goes into its correct department, and the engine, on completion, passes through the test shop, just as if it were new; in fact the overhauled chassis may, as a whole, be considered very nearly as good as when first produced.

Several new models will figure in the 1930 programme and will attract much attention at the forthcoming Commercial Show at Olympia in November. A new 2-ton chassis for freight haulage, equipped with a super-efficient six-cylinder engine will figure prominently in the programme.

On the goods side there will also be new 4, 5 and 6-ton chassis; in each one the power unit will be six cylinders.

For coach and bus work a chassis for 20/24 passengers, and one having capacity for thirty-two seats, both featuring six-cylinder engines, will be included.

DENNIS BROS. LTD.,

Guildford.

It was in the year 1895 that Messrs. John and Raymond Dennis founded the firm of Dennis Bros., which is now, without doubt, one of the most successful in the industry, and it is indeed one of the most outstanding examples of success in the history of the motor trade, as its growth has been continuous. The firm was formed into a private limited liability company in 1901 with a capital of £30,000, in 1906 the capital was increased to £100,000 which was subscribed by the existing share-holders at the time, so satisfied were they with the conduct and progress of the business. In 1913 the business was turned into a public company with a capital of £300,000 which was increased to double that sum six years later. In 1919 the firm acquired the whole of the shares in White and Poppe, Ltd., the well-known engine manufacturers. In 1906, whilst the firm had never paid less

Digitized by Google

than 12½ per cent. dividend a dividend of 20 per cent. was declared in addition to which a considerable distribution of shares was made to the shareholders. The firm was not at first interested in the manufacture of commercial vehicles having commenced with push bicycles and subsequently motor-cycles followed by motor cars. In 1903 a 16 h.p. Dennis car secured 2,991 marks in a 1,000 mile trial organised by the Automobile Club, other successes followed. Dennis Bros., had realised the great possibilities of the commercial vehicle business and the first of this class they manufactured was a 15-cwt. model followed by 30-cwt., 2-ton, 3-ton and 5-ton models. The firm have been pioneers in many directions, the most notable innovation being the famous worm driven back axle, this being patented in 1904. As our readers are fully aware this form of drive is in almost universal use at the present time. The first worm driven motor omnibus placed in service in London was a Dennis, which was supplied to the London and Suburban Omnibus Company in 1904. In 1913 they produced their first War Office subsidy model which had a capacity of 3½ to

ONE OF THE FIRST LONDON MOTOR OMNIBUSES BUILT BY DENNIS BROS., LTD.

4 tons. 7,000 of this type of vehicle were supplied to the War Office during the war. The firm were also

A 15-CWT. DENNIS VAN SUPPLIED TO HARRODS, LTD., IN 1904.

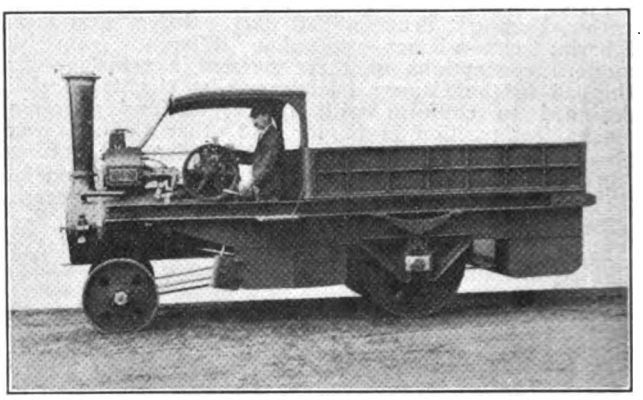
the first successfully to apply the turbine pump to motor fire engines, a branch of their business which they have as successfully developed as other branches. The war being over the Company were more alert than their contemporaries in the manner in which they tackled the peace time conditions. In this connection Sir Raymond Dennis completed a world tour in 1920-1921 to investigate transport conditions in all parts of the world. As a result of this tour a 2/2½-ton model was produced which was an immediate success both at home and abroad.

With regard to public service vehicles the firm are manufacturing practically every type required both for such purposes as street watering, gully emptiers, street washing machines, cesspool emptiers, as well as passenger vehicles. With regard to passenger vehicles it is interesting to note that not only was a Dennis the first worm driven chassis to be placed on the London streets, but also the first pneumatic tyred bus to be passed for service in London was a Dennis, this being in the year 1925, and also the first four-wheel brake bus to be passed by the metropolitan police was a Dennis. The present Dennis works, at Woodbridge, near Guildford, occupy 40 acres. The Guildford and Coventry workshops together cover an area of 24 acres. Undoubtedly, the present remarkably successful position held by Dennis Bros., Ltd., is due to the scientific application of organisation and the equally high quality of the products of the firm.

FODENS, LIMITED,

Elworth Works, Sandbach.

Fodens, Ltd., is one of the oldest pioneer Companies in the steam wagon industry, as far back as 1882 the



EARLIEST TYPE FODEN STEAM WAGON, BUILT ABOUT 1896.

late Mr. Edwin Foden (the founder of the Company) was making traction engines of a very successful type, so successful was this machine that ere long the mind of the designer was busily engaged on the production of a steam wagon. Several years of patient experimental work on a number of types ultimately led to the decision of the best type to be adopted. Thus, in 1901, one of the Foden steam wagons was entered for the War Office Trials, which took place at Aldershot and resulted in an award of £250 prize to the Foden wagon. This important success brought Mr. Foden congratulations from far and near and caused a great amount of interest to be taken in future development of this product. From this point the Foden steam wagon was an established fact, and at present hundreds of skilled men are engaged in turning out this entirely British Product and distributing it not only in this country but to many parts of the world.

The early work of the late Mr. Edwin Foden was concentrated on portable and fixed steam engines, agricultural machinery, and threshing machines. On the side of steam engineering the firm produced an improved horizontal fixed steam engine and later a vertical steam engine and boiler combined, which on account of the smaller space required was eminently adapted for warehouses and printing offices where space was valuable.

For all the operations of the farm in which mechanical power was adapted they produced a portable steam engine mounted on either wood or iron travelling wheels according to the desire of their customers. In all these devices for employing the latest power of fuel the firm prided

Digitized by Google

themselves on the economy which they achieved with these engines in the matter of fuel consumption.

In the light of even modern results there appears to have been justification for what may be called pardonable pride. It can now be seen how the attention of Mr. Foden became attracted to the problem of the steam wagon and the sequence of events which led to the remarkable success attained both by him and his successors. The story is one of considerable interest, involving as it does the record of the development of the industry from what was practically a pioneer vehicle to the large industry which is established to-day and is of world-wide fame. From a very early catalogue issued by the firm of Hancock & Foden it is interesting to note that there was oneness of aim with these pioneers in engineering, for in the introductory remarks we read that "To obtain the highest amount of power with the smallest quantity of fuel is the most important point aimed at in the manufacture of their portable and fixed steam engines, and it will be found in practice that the engines are both thoroughly efficient in working power and economical in the consumption of fuel."

WILLIAM FOSTER & CO., LTD.,

Wellington Foundry, Lincoln.

The firm, William Foster & Co., Ltd., was established in 1856. Being amongst the oldest manufacturers of traction engines and road locomotives, with the passing of the Light Locomotives Act they at once began to manufacture a light tractor. The first "Wellington" tractor was made by them in 1904. The permissible weight at this time was 4-tons and the engine had a single cylinder. Within a few months the regulation with regard to weight was altered to 5-tons, and the 5-ton compound tractor was put on the market. The present "Wellington" steam tractor, naturally, is a great improvement on the original design as it embodies all the latest and best principles known to traction engine builders and, owing to the firm's very wide experience in this important branch of their business, purchasers are assured of obtaining a thoroughly reliable machine.

JOHN FOWLER & CO. (LEEDS), LTD.,

Leeds.

The name of John Fowler & Co. (Leeds), Ltd., has been closely associated for over half-a-century with the development of steam ploughing tackle. They were indeed the pioneers of mechanical cultivation. The late Mr. John Fowler, the founder of the firm, invented and built the first practical steam ploughing equipment which was exhibited at work at the Royal Agricultural Society's Show at Exeter in 1850. In 1856 the Fowler ploughing tackle was awarded the Gold Medal of the French Agricultural Exhibition and this was followed by similar awards at the Royal and Highland Society's Shows. In 1860 Mr. John Fowler established the present Leeds Works, at Hunslet, which now covers an area of 15 acres.

It is interesting to note that in 1875 steel plates were introduced in the boilers, and compound engines were introduced together with a special method of completely steam jacketed cylinders, and these improvements are still adapted in the present day products. The products of the firm so far consisted of the following steam tackles:—Ploughing tackles, traction engines, road rollers, railway locomotives, winding engines, stationary engines and tram cars.

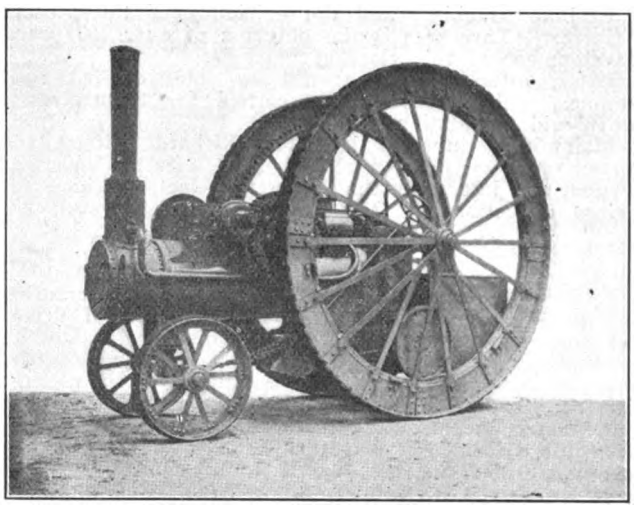
In 1881 a boring machine was built for the Channel Tunnel and worked with entire satisfaction until the Government stopped the operations.

In 1900 the works were rebuilt and new machinery installed in order to keep abreast of the progress that had been made in the science of engineering.

In 1904 internal combustion engines were introduced as power units for cable ploughing tackles, road rollers, standard gauge rail locomotives and light railway locomotives, and since then experiments have been made with the diesel type of engine. Experiments have proved so satisfactory that they are fitted as the power units to the Fowler products mentioned.

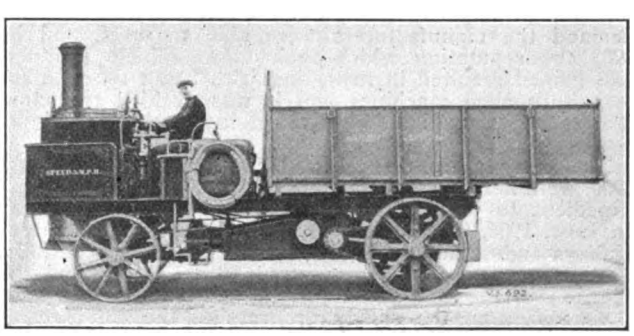
In 1923 builders and contractors plant was added to the products of the firm including concrete mixers of all sizes and types, winches and elevators, for which the demand has increased to such an extent that special shops have had to be built for their manufacture.

Steam wagons were first produced in 1923 and were shown for the first time at the Royal Agricultural Show, Leicester, 1924. The design embodied motor car practice with all working parts totally enclosed. Upon this steam wagon chassis there was later mounted a street gully emptier which is now an exceedingly popular vehicle amongst municipalities. This was followed by street washing and watering equipment, sewer flushing apparatus, incorporated in the design; and street cleansing



AN EARLY TYPE FOWLER TRACTION ENGINE WITH 12-FEET HIND WHEELS.

machines have now been produced for the sole purpose of street washing, watering, channel damping and sewer flushing. The petrol vehicle has also been included in the Fowler products, and petrol driven street gully emptiers, street cleansing machines and cesspool emptiers can now be supplied where required. Fowler specialities also include the Fowler road locomotive and special trailer wagons fitted with rubber tyres for the transport of loads from 10-tons to 100-tons. Another Fowler product is the Fowler-Wood complete roadmaking plant, using the Fowler penetration method. The plant consists of a steam road roller with tank attached for heated tar, bitumen and binding compounds which are kept hot by means of a steam coil. A pump and spraying nozzles complete the outfit to which is attached a gritter for the distribution of grit and chippings on the sprayed road. Fowler products are world wide famed, and at the present time 60 per cent. of the orders are from abroad in spite of keen competition from other countries. The works at the present time are capable of employing 2,000 men and the machinery throughout is driven by electricity obtained from the Leeds Corporation.



A 1904 GARRETT UNDERTYPE STEAM WAGON.

RICHARD GARRETT & SONS, LTD.,

Leiston Works, Leiston, Suffolk.

The history of Richard Garrett & Sons, Ltd., of Leiston Works, Leiston, Suffolk, provides a typical example of the progress of industry, this firm being one of the oldest engineering concerns in the country.

It was founded in 1778 by Richard Garrett, the great-great-grandfather of present directors. The firm at that time were the leading makers of the only agricultural

Digitized by Google

tools then used, viz., sickles and scythes. Subsequently these were followed by other agricultural implements, such as turnip cutters, chaff cutters, iron ploughs and harrows, and these implements earned world-wide reputation and built up for the firm an extensive Home, Foreign and Colonial connection.

In 1806, that Richard Garrett designed the first power Threshing Machine, and the efficiency of the present "Garrett" Threshers is the outcome of over 100 years' development of this class of machine.

Later, attention was turned to self-propelled road engines, which have equally earned for themselves a world-wide reputation.

Maintaining inherent initiative, Richard Garrett and Sons, Ltd. developed in 1904 the "Garrett" undertype wagon, and later still, the "Garrett" electric vehicle for refuse collection and the "Garrett" trolley bus.

HALLEY MOTORS, LIMITED,

Yoker, Glasgow.

As is well known, the company's present manfuacturing programme comprises a wide range of petrol driven machines, upon the production of which their activities are specifically concentrated. It may therefore surprise many to learn that the original syndicate, which was the fore-runner of the present company, was constituted to manufacture steam vehicles. In 1901 the late Mr. George H. Halley formed a private syndicate and commenced manufacturing. In that year a 3-ton steam wagon and a steam driven touring car were listed. The industrial

A HALLEY PETROL LORRY DELIVERED IN 1907.

vehicle proved a successful proposition, so much so that in 1903 the capital of the original company, which traded under the title of the Glasgow Motor Lorry Co., Ltd., was increased and the construction of steam wagons embarked upon.

This necessitated the acquisition of larger premises in Crown Point Road, Glasgow. At this time it was found that the principal demand was for a 5-ton wagon. This demand the manufacturers were able to meet, and by 1905 the reputation which their steam-vehicle products had gained resulted in many inquiries being received for petrol-propelled machines and it was decided to manufacture an internal-combustion engined vehicle, and accordingly a design was evolved.

The early petrol models, which first appeared about 1906, were much in demand, and in due course it was found expedient to obtain larger works and increased capital. In June, 1906, therefore, a company bearing the name of Halleys Industrial Motors, Ltd., was floated successfully. A site for new works was acquired at Yoker, and the erection of the company's present premises commenced.

As indicating the steady progress of the company, it may be mentioned that the floor space occupied in 1912 was 11,060 sq. ft., in 1913 37,446 sq. ft. and in 1914 63,159 sq. ft., after which followed a period of inflated production brought about by the demands of the war, the space devoted to motor-vehicle production in the first post-war year being 70,117 sq. ft. The company's present site extends to 10 acres.

Up till the year 1907 practically the whole of the output of the company was disposed of in Scotland, particularly in the neighbourhood of Glasgow, but in that year they entered two vehicles in the Commercial Vehicle Trials held by the Royal Automobile Club, and the success of these vehicles resulted in an immediate accession of orders from all parts of Great Britain and abroad.

In 1907 a 20 h.p. chain-driven chassis with a capacity of 2 tons was brought out, and this included in its design a two-cylinder engine with a bore of 5 ins. and a stroke of 5½ ins. A 3-ton chassis and a 4-ton chassis were also introduced at this time.

In 1910 four new chassis were introduced, these being a 30-cwt. chassis, a 3-ton chassis, a 5-ton chassis and a 2-tonner, the last named superseding the original production with a similar capacity introduced three years earlier. Each of these chassis was chain-driven and embodied a four-cylinder engine. We then pass on to the year 1912, when a new 3-tonner was marketed, as well as a 60 h.p. 7-ton chassis with a six-cylinder engine, whilst the following year witnessed the birth of a new 5-ton chassis.

Up to this time the company had been worthy exponents of the chain-driven chassis, but from 1914 onwards they have devoted increasing attention to other forms of final drive. It was in 1914 that they marketed a 3-ton live-axle model with a four-cylinder engine with a bore of 4½ ins. and a stroke of 6 ins.

During the whole war period the factory was controlled by the Government, vehicles, shells, aeroplane, tank and vehicle components formed the main output.

At the conclusion of hostilities the factory production was changed over with all speed to the production of the first six-cylinder commercial vehicle listed as a standard machine in this country. This was a 3½-ton live-axle model, designs for which had been prepared during the war period, and a large output of vehicles was quickly achieved.

The entire factory resources were thus concentrated on a capacity of machine, the demand for which was ultimately overwhelmed by the sale of returned W.D. lorries. The company was thus affected to an even greater extent than other manufacturers by the severe post-war depression, and very heavy losses were incurred retarding, for a time, its further development. With a view to the provision of increased working capital, the company was successfully reconstructed in 1927, at which time the firm's name was shortened to its present form.

In 1927 a 2-ton model and a rigid six-wheel passenger model were introduced.

In 1928 there appeared an 8-ton rigid six-wheel goods chassis, a 4-ton 4-cylinder overtype chassis, a 3-ton chassis, and the well-known "Conqueror," and "Chieftain" bus chassis.

In the present year new 4-cylinder normal control 4-ton chassis and 5-ton normal and forward control chassis have been developed together with a special low loading municipal refuse collection vehicle.

During the past 3 years it will be seen that the entire Halley range has been re-designed.

The general policy of the company has always been to develop their products with exclusive regard to the requirements of goods and passenger transport, and their long experience of the problems associated with the production of such vehicle types is evident in the present machines marketed, which are characterised by clean and robust design and marked economy in service.

KARRIER MOTORS, LTD.,

Huddersfield.

At Huddersfield is one of the largest and best equipped works in England engaged in producing heavy motor vehicles well known the world over for their reliability, strength, and longevity. We refer to the organisation and development of Karrier Motors, Ltd., which commenced its activities over 20 years ago. Designed in 1907 by Mr. R. F. Clayton, the present Vice-Chairman and Joint Managing Director of Karrier Motors, Limited, the first Karrier vehicle—a 30 cwt. lorry, with 18 h.p. two cylinder engine—was built by Clayton & Co. (Huddersfield), Ltd., in the year 1908. Originally there was one small shop in Colne Road, Huddersfield, where component parts were machined and chassis assembled, and it is interesting to know that the total number of employees at that time was thirty-five. The first year marked the experimental stage, and the following year, 1909, saw the construction and delivery of fifteen vehicles, some of which are still in commission and giving excellent service. Following extensions and an increase of employees, deliveries in the third year increased to forty-six, which number included models of from 30 to 50 cwts. capacity. In 1913, a 3/4-ton lorry was designed to comply with the War Department subsidy specification, and along with a number of other leading maker's vehicles it took part in the trials held in October of that year by the War Office. Oil and petrol consumptions, accessibility, speed and hill climbing capabilities were special features of these trials, and as a result of the performance

Digitized by Google

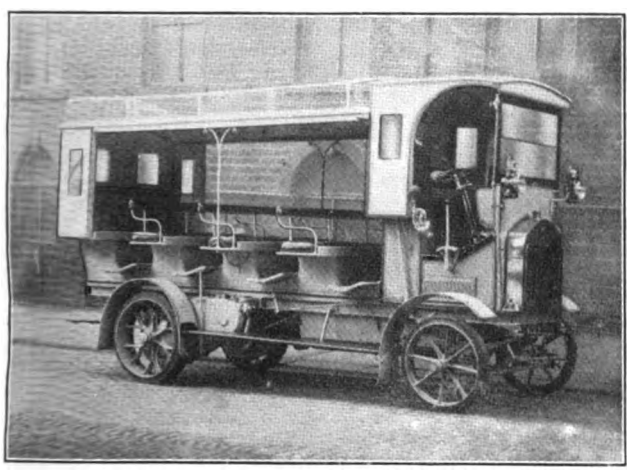
of the Karrier lorry, Clayton & Co. (Huddersfield), Ltd., were awarded a Subsidy Certificate.

A number of these subsidy lorries were ordered by the War Office, and by a fortunate coincidence were ready for delivery when the war commenced in August, 1914, so that the next four years saw very great activity on the part of the firm; upwards of two thousand 4-ton lorries being turned out for the Government during this period, in addition to a considerable number of components for Tanks.

Since the Armistice in November, 1918, developments have been rapid. The year 1920 saw the formation of Karrier Motors, Limited, which took over the business established by Clayton & Co. (Huddersfield), Ltd., together with works covering several acres in St. Thomas's Road, where at present upwards of 1,000 workpeople are employed.

With the passing years a gradual improvement of design has taken place, until to-day a range of goods models for loads of 40 cwts. to 12 tons is manufactured, along with passenger models seating from 20 to 72, and they are being operated by leading concerns the world over with great success.

Special municipal-purpose models also occupy an important place in the Karrier programme, and apart from the renowned Karrier "RSC" model which has been instrumental in effecting great economies in street cleansing, the experience gained in the production of this



KARRIER OPEN-SIDED 20-SEATER BUS BUILT IN 1908.

combined sprinkling, sweeping and collecting machine, has led to the introduction, quite recently of an equally effective machine for the collection of house refuse. This new product—known as the Karrier Dustless Refuse Collector—embodies all the essential qualities which officials in the public cleansing world consider necessary in order to effect hygienic and not too costly collection.

The firm were the British pioneers of the rigid-frame six-wheeler which is acknowledged as the most advanced type of vehicle on the road for either goods or passenger transportation, and apart from the fact that 19 leading municipalities now operate Karrier passenger vehicles of this class with every success, the remarkable ability of the goods model six-wheeler in traversing rough and broken country quickly and without detriment to its own mechanism, has resulted in the acquisition of machines of this description in large numbers by governments and private users both abroad and in distant parts of the Empire.

It should be noted, incidentally, that two standard machines of the Karrier "WO6" type—medium capacity six-wheelers—have the distinction of being the first goods-carrying vehicles to encircle the vast continent of Australia—a distance of approximately 11,000 miles. During this arduous journey through undeveloped, wild and trackless country, hundreds of miles of sandy and "gibber" plain had to be crossed, whilst mountain ranges and endless miles of roadless country never previously attempted by heavy vehicles also had to be traversed, but it is noteworthy that the vehicles—pushing along at an average rate of 500 miles a week for 22 consecutive weeks—ran to schedule throughout!

As business expanded, the needs of sales and service depots in countries overseas was met by the establishment of agencies in Australia, New Zealand, South Africa, India, South America, Greece, Finland and Czecho-Slovakia, and they have undoubtedly proved of great assistance in building up the business to the position it now holds among British commercial motor vehicle manufacturers.

Karrier Works—the home of Karrier Motors, Limited, Huddersfield—are conveniently situated not far from the centre of the town. They have recently been considerably enlarged, and the various shops—of modern construction, well lighted and ventilated on the most up-to-date principles—are systematically arranged with a view to economic production.

The whole of the various castings, stampings, pressings, etc., are rigidly inspected previous to being passed into the rough stores, from where they are passed along as required to the assembly shop, and thence as complete units to the erecting shop, where the building up of the various types of chassis is proceeded with in one direction commencing with the frame. Overhead travelling cranes run around the shop and assist in the placing into position of the heavier units. Engines, of course, are assembled in a separate department, each undergoing a prolonged "brake-horse-power" test—Heenan and Froude dynamometers being employed—previous to being placed in a chassis.

Complete machines are passed over to the road test department, who thoroughly test out each and every chassis—with loads in excess of those which they will normally have to carry—over a 70 to 100 mile route which includes some of the steepest gradients and most trying surfaces that can be found anywhere in the country.

The works are heated by a low-pressure system throughout, and a very fully equipped and beautifully kept first aid room is installed, with a competent man in charge. A capacious canteen is fitted up and controlled by the firm for the welfare of the inner man. Mention should also be made of a most important section of the works, the service department, where complete overhauls of an exacting nature can be tackled. This department has its own machine shops and its stores carry spares in stock covering the whole of the various Karrier models produced since 1908.

LEYLAND MOTORS, LTD.,

Leyland, Lancs.

This firm, formerly the Lancashire Steam Motor Company, has been engaged in the manufacture of commercial vehicles since 1896. To-day the company's employees number upwards of 5,000, its Lancashire properties alone extend to over 160 acres, whilst in addition to its main works at Leyland, Lancashire, it has branch works at Chorley and Kingston-on-Thames, and possesses its own steel and non-ferrous foundries. It has depots in the larger towns throughout the United Kingdom, direct branches in Australia, Canada, India, New Zealand, South Africa and the Far East, and agents in other parts of the world. Though for many years the company has built both petrol and steam-driven vehicles and has in the past produced one of the finest racing cars, its products are now limited to petrol-driven commercial vehicles of all types which include buses and coaches, goods vehicles, fire engines and other specialised vehicles for municipal work.

As early as 1885 experiments for utilising steam power for driving road wagons were being carried out with no little success in a blacksmith's shop at Leyland, but it was not until the passing of the Locomotives on Highways Act in 1896 that these experiments materialised by a company styled The Lancashire Steam Motor Company, which was formed in that year. Its first steam wagon was produced in 1897 and it secured the first prize at the trials organised by the Royal Agricultural Society in 1897. The company repeated its success in the following year as well as obtaining another £100 prize at trials held by the Liverpool Self-propelled Traffic Association in 1898. An increased demand following these successes resulted in the purchase of land, and building commenced on the present site in 1918. The possibilities of the petrol wagon were not overlooked, and in 1904 an experimental machine came out of the works at the close of that year. It had a carrying capacity of 30 cwt. Further experiments were carried out and larger models fitted with 24 h.p. engines with 3, 4 and 5-ton capacities for goods or omnibus work followed. The first petrol-driven omnibus sold by the company was delivered to the London and Suburban Omnibus Company in the summer of 1905. The business of the company developed rapidly and in 1910 more land was purchased in Leyland and in the same year a service depot was opened in London to operate a mail van service under a Government contract and to give service to customers in the south. In the

Digitized by Google

same year the company began to manufacture fire engines. In 1912 the War Office Subsidy Trials were held and two Leyland vehicles were awarded the certificate of success. The Leyland was therefore the first vehicle to be subsidised, a fact which led to some 6,000 Leyland vehicles being used during the war, during which period the whole of the Leyland output was at the disposal of the Government. Some time subsequent to the war the company designed and produced the Leyland "Lion." This was the first breakaway from the practice of adapting goods vehicles for passenger work. It was a low-loading single-deck bus with a body which formed the basis of many future competitive designs. Not the least important of the Leyland organisation is its service. The headquarters of this comprehensive organisation is, for convenience, located at the main works where it has its own transport, despatch department and separate stores. In these stores stocks of spares to the value of £50,000 are available day and night. The company has constantly pursued the policy of direct representation both at home and abroad. The present range of models includes 2½ and 3½-ton light goods models and in the heavy goods range 4 to 7-tons. Of rigid six-wheelers it builds two types, the "Terrier" and the "Hippo." The "Terrier" is built in two models, each being designed to carry 3 to 4-tons across country. The "Hippo" is for heavy loads up to 11 tons. Of passenger vehicles Leylands produce three special chassis, known as the "Lion," "Tiger" and "Titan." The "Lion" and "Tiger" have 4 and 6 cylinder engines respectively and are intended for single-decked coaches. There is also the "Lioness-Six" which, like the "Tiger," is suitable for long distance coach work. The "Titan" chassis is for double-deck bus bodies. The Leyland Company supplies bodies suitable for every conceivable purpose.

THE FIRST PETROL-DRIVEN LEYLAND LORRY BUILT IN 1904.

AN EARLY LEYLAND PASSENGER VEHICLE.

MAUDSLAY MOTOR CO., LTD.

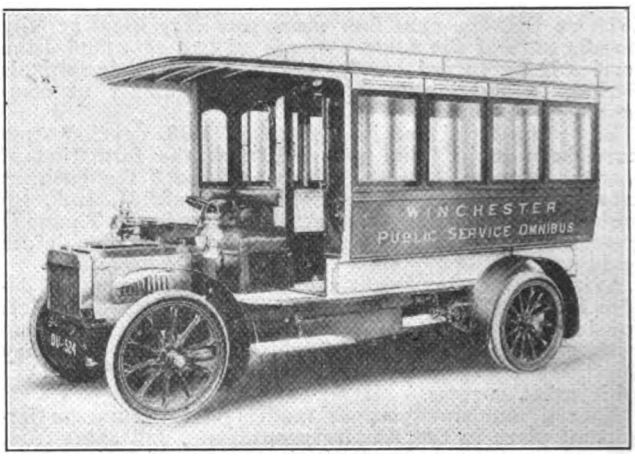
Parkside, Coventry.

For just upon 27 years, the activities of the Maudslay Motor Company, Limited, have been in a great measure concentrated upon the manufacture of large capacity passenger and goods carrying vehicles, and so far back as 1902, a convertible "Waggonette-Omnibus" was exhibited by them at the Royal Agricultural Hall, London.

Designed and constructed upon sound engineering principles, the Maudslay vehicles have always ranked amongst the very best of British products. In them are embodied the salient features necessary to promote economical running and accessibility. The firm have been pioneers in various types of design which are to-day more or less universal. For instance, motor engines having all valves overhead were first manufactured in this country by the Maudslay firm, their 1902 exhibit above referred to being so built.

The Company's system of forced lubrication of the i.c. engine, adopted by all leading makers now, was pioneered by them on their first models.

It is also worthy of note that in 1907, following a 22 days' strenuous trial, a Maudslay 3-ton lorry gained the War Office Diploma and also the Gold Medal offered by the Royal Automobile Club, for excellent performance and outstanding accessibility. The Company was also amongst the first in England to introduce the now exceedingly popular "low level safety" passenger coaches and omnibuses, the standardising of brakes on all four road wheels and the fitting of pneumatic tyres. For some considerable time, Maudslay low level double-deckers, with covered in top, have formed part of the Coventry Corporation fleet of omnibuses. The Maudslay Motor Company have two factories, one at Parkside,



20-H.P. MAUDSLAY 14-SEATER BUS BUILT IN 1905.

Coventry, and one at Maudslay Road off the Allesley Old Road, the latter being built to meet the constantly increasing demand for its vehicles, and from this excellently equipped and situated works, emanate the Maudslay luxurious safety coaches in service up and down the country.

The range of Maudslay vehicles now being manufactured are as follows:—Goods carrying vehicles—a 10-ton rigid six-wheeler and four wheel vehicles of the following capacities:—7/8 tons, 6 tons, 5 tons, 4 tons and 3 tons. Passenger vehicles—a 26/30-seater, normal steering, a 32/38-seater, forward steering, a 26/30-seater normal steering and a 30/36-seater forward steering.

RANSOMES, SIMS & JEFFERIES, LTD.,

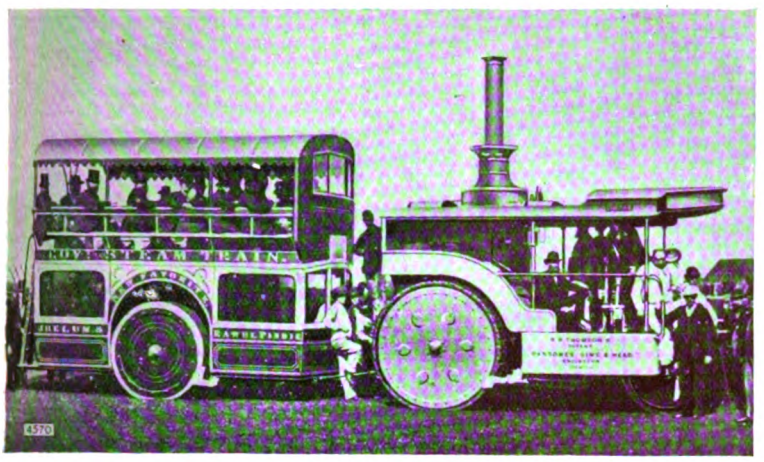
Orwell Works, Ipswich.

The history of these works dates back to 1789 when Robert Ransome started his foundry in Ipswich. His first business was that of an ironmonger in Norwich with a small brass foundry to which was afterwards added an iron foundry and the manufacture of ploughs. In 1789 he removed to Ipswich, and in 1806 brought out the well-known chilled plough-share, which laid the foundation for the future greatness of the firm. The first steam plough was manufactured in 1856 for Mr. John Fowler at their works. Ransomes were among the earliest pioneers in the introduction of threshing machines worked by steam, and steam engines of the portable class. At Bristol, in 1842, they showed a self-moving engine capable of travelling at the rate of 4 or 5 miles an hour, whilst in 1871 four road steamers were built for passenger service for the Indian Government, the then Lt. Crompton (now Col. Crompton, R.E., C.B.), being associated with their manufacture on behalf of the Government. The business was turned into a limited company in 1884. The works now extend over 30 acres and are capable of employing 3,000 men. When war broke out the Orwell Works were as far removed from the production of war-

Digitized by Google

like implements as any works in the country, but by the time the war had reached its intensity they were fully organised and the majority of the 5,000 men and girls employed were on war work.

Since the war the aircraft factory has been adapted to the manufacture of electrical specialities including electric road vehicles and industrial trucks, of which



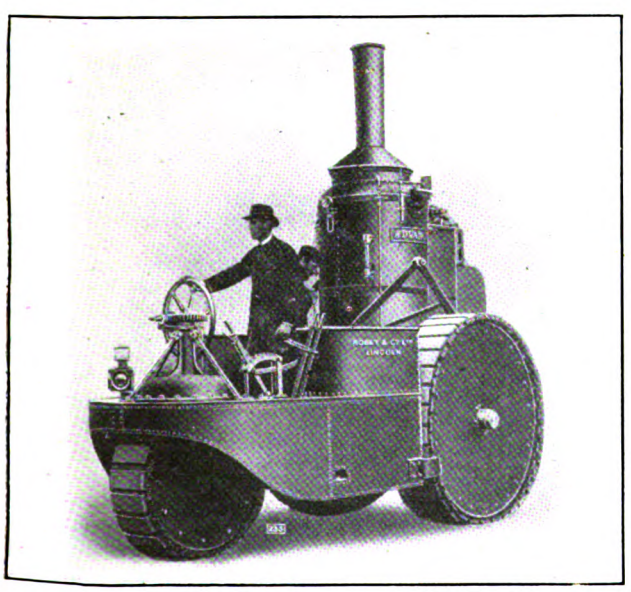
RANSOME ROAD STEAMER BUILT IN 1871 FOR THE INDIAN GOVERNMENT.

Ransomes were the first British makers, electric motors and dynamos, electric runabout cranes, bodywork of all kinds for omnibuses, etc., and electric trolley buses.

ROBEY & CO., LTD.,
Globe Works, Lincoln.

The firm of Robey & Co., Ltd., Lincoln, was founded as long ago as 1852, and their Globe Works cover an area of about 20 acres.

Originally, portable engines, traction engines and threshers were made by them, so that, from the very commencement, they have been associated with all kinds of self-moving engines.



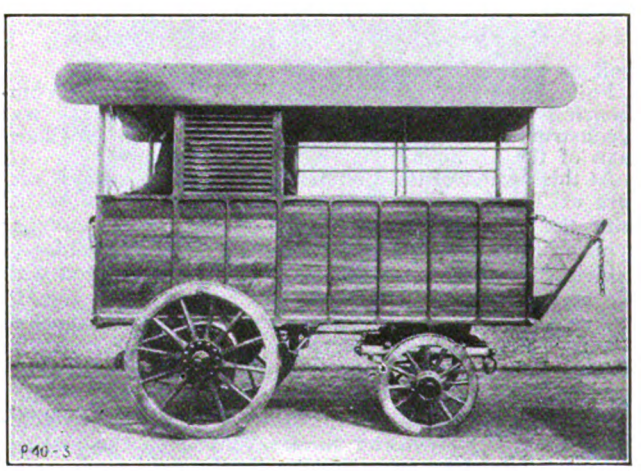
A ROBEY STEAM ROAD VEHICLE BUILT IN 1870.

They have supplied upwards of 45,000 engines of various types and sizes to all parts of the world; a large proportion being for road haulage, and these machines have built up for them the world-wide reputation that they now enjoy.

It is indeed a far cry from the old steam road vehicle of 1870, shown in the photograph, to the up-to-date "Robey" steam wagon and "Express" rubber tyred tractor with three speed gear, etc., both of which vehicles can travel with their full loads at speeds far in excess of the legal maximum, and all the practical experience gained over the period of years is embodied in the present models, which may rightly be described as second to none.

JOHN I. THORNYCROFT & CO., LTD.,
Thornycroft House, Smith Square, London, S.W.1.

The firm was founded in 1864 by Mr. J. I. Thornycroft, and the success of the firm's activities is said to be dated from 1871, when the steam launch "Miranda" achieved a speed of 18 knots per hour—an unprecedented speed at that time. Then followed the construction of H.M.S. "Lightning" in 1876. The firm's experience in the production of light and efficient steam engines led them to undertake the manufacture of steam wagons, the first works being established at Chiswick, but shortly afterwards, in 1908, new works were erected at Basingstoke. A separate company was formed known as the Thornycroft Steam Wagon Co., Ltd. In 1901 the original firm was formed into a limited liability company under the title of John I. Thornycroft & Co., Ltd., and three years later it absorbed the Thornycroft Steam Wagon Company. The first Thornycroft steam wagon was built in 1895 to carry 1-ton loads. The vehicle was exhibited at the Crystal Palace Motor Show, 1896. In the same year the Chiswick tip wagon was produced, taking its name from the fact that it was the first municipal vehicle supplied to the Chiswick U.D.C. In 1898 there followed the Chelsea tip wagon which was a 4-tonner with vertical water tube boiler, central stoking and compound engine. In 1903 a new model in the form of a paraffin driven lorry with a capacity of 2-tons was built to a War Office order. In 1904 two petrol-driven models were built and a 5-tons steam wagon with loco type boiler and compound horizontal engine. Though Thornycrofts are no longer manufacturers of steam wagons we believe there still remain several of their early models in service. In 1905 a 25 cwt. petrol lorry was produced and also a 5-tonner and a 36-seater bus was also designed. In 1906 a 4-ton petrol wagon was constructed and the next year a 2-tonner. In 1913 there was introduced the famous J type 4-ton chassis, and in this model the worm driven back axle was substituted for the chain driven back axle hitherto employed. Other models of similar design followed, namely, a 2½-tonner and a 4½-tonner, the latter being specially designed for military purposes. To-day the Basingstoke works of John I. Thornycroft & Company, where the firm's various types of commercial chassis are produced, now occupy an area of 20 acres.



THE FIRST THORNYCROFT COMMERCIAL VEHICLE—
A STEAM WAGON BUILT IN 1895.

TILLING-STEVENS MOTORS, LTD.,
Maidstone.

The present business of Tilling-Stevens Motors, Limited, has developed from its commencement in the year 1897 as a private firm of electrical mechanical engineers, established for the manufacture of dynamos, electrical generators, and general electrical plant. In the year 1906 the sole remaining partner, Mr. W. A. Stevens, registered the business as a private limited liability company with a capital of £10,000, and the first experiments in petrol-electric transmission were commenced. In the

Digitized by Google

year 1907 the results obtained from a touring car with petrol-electric transmission were sufficiently satisfactory to encourage the company to continue its endeavour to develop this method of propulsion. The attention of Thomas Tilling, Limited, was drawn to the system, and the interest shown by that important company resulted in the joint design by Mr. W. A. Stevens and the chief engineer of Thomas Tilling, Limited, Mr. P. H. Frost Smith, of an omnibus for operating in London traffic. This omnibus gave satisfactory results in London service, but the regulations of the London police, which came into force about that time, prescribed a weight limit at a much lower figure than that at which it was possible to produce the vehicle. Thereupon Mr. Stevens and Mr. Frost Smith set to work to design a lighter chassis with a much lighter electrical equipment, and produced a new design within the weight limit; seven of these new omnibuses were put into London service by Thomas Tilling, Limited, and the operation of them for several months showed a very low cost of maintenance, largely due to the exceptionally smooth running under electric transmission. As a result, Thomas Tilling, Limited, decided to replace the whole of their vehicles by a fleet of the same type.

Thomas Tilling, Ltd., continued to take an interest in the company, and in 1915 the name was altered to Tilling-Stevens, Ltd. The company was manufacturing petrol-electric chassis for passenger and commercial work, as

EARLY TYPE OF TILLING-STEVENS PETROL-ELECTRIC OMNIBUS BUILT IN 1910.

well as gear-driven vehicles for commercial work.

Following and in consequence of the trade slump commencing in 1920, during the year 1925 the board was reconstructed, and Mr. H. E. Carter was appointed Chairman of the Company.

At this period of the Company's development the Directors of Thomas Tilling, Ltd., had become so impressed with the disadvantages to large operators of passenger vehicles in being also identified with the manufacture of vehicles, that they decided to sever their connection with the company.

The designs and experiments for new gear-driven and petrol-electric engines, which had been uninterruptedly continued, resulted in the production of the present gear-driven "Express" vehicle. The performance of this vehicle under exhaustive tests proved its ability to compete favourably with any similar vehicle on the market. At the same time the Company's designs, experiments and tests for the production of an equally up-to-date petrol-electric vehicle were continued.

Mr. W. R. Shephard took over the position of Managing Director at the beginning of the year 1927, and alterations and rearrangements in the Works were made by him.

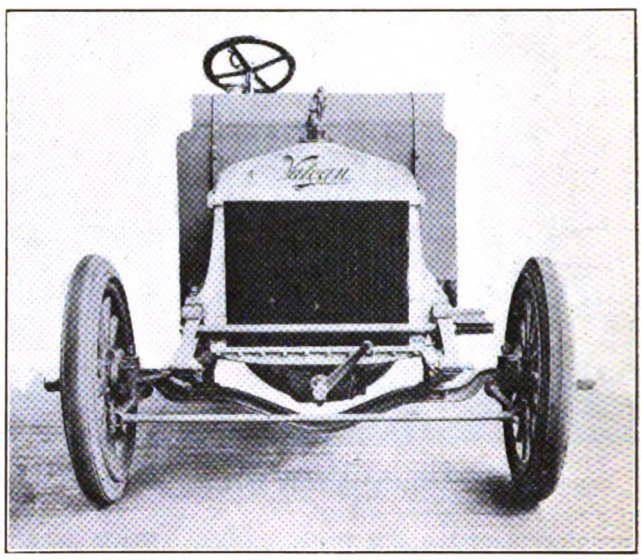
The company has established the highest reputation for the "Express" gear-driven vehicle, and there is every reason to hope that the new petrol-electric chassis, now being tried on the London streets, will give the same satisfaction.

Tilling-Stevens Motors, Ltd., is the only company which makes a practical electrically propelled vehicle other than trams and overhead rail trolley vehicles, and there should be a great future for this excellent and economical type of passenger and goods transport.

VULCAN MOTOR AND ENGINEERING CO. (1906), LTD.,

Crossens, Southport.

The Vulcan business began in 1897, the founders being Thomas and Joseph Hampson. Both were highly qualified engineers with a decided leaning towards motor construction. The business prospered from its commence-

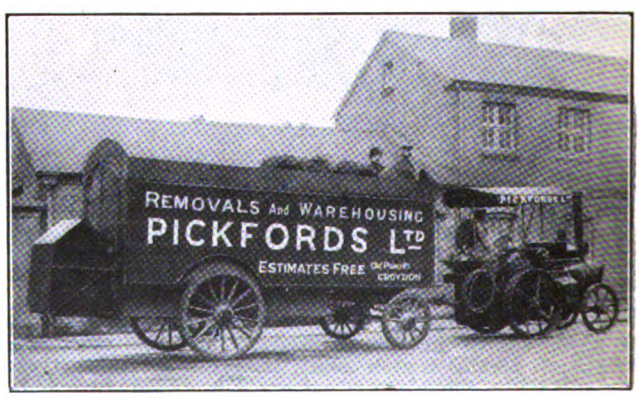


AN EARLY VULCAN CHASSIS.

ment, and to cope with the increasing number of orders, a private company was formed and extensive premises and a large tract of spare land were acquired in Hawesside Street, Southport, and here were manufactured large numbers of Vulcan vehicles. Year by year the factory extensions had to be made until all the available land at Hawesside Street was covered with workshops. But still the business increased, and so the directors decided to obtain more money and additional premises, and to this end the company was reformed with a much larger capital, thus the present Vulcan Motor and Engineering Co. (1906), Ltd. was launched 23 years ago and a large plot of land was acquired close to Crossens Station upon which large engineering works were erected and equipped with most up-to-date machinery. The work of this new factory was confined exclusively to chassis production, the body building and furnishing being executed at Hawesside Street. Later the factory was made much larger enabling the body building and furnishing departments to be transferred to it. To-day the Crossens factory is claimed to be one of the most up-to-date of its kind and is entirely engaged in the production of Vulcan motor vehicles. Vulcan vehicles are known throughout the world as being a first-class British product.

WALLIS & STEEVENS, LTD.,

The firm commenced building self-propelled road engines in 1877 and kept pace with the developments in the way of heavy haulage engines in the intervening years



AN EARLY TYPE STEAM TRACTOR BY WALLIS & STEEVENS.

until 1889 when they introduced the first light steam tractor. This type of vehicle they have continued to develop and are still building.

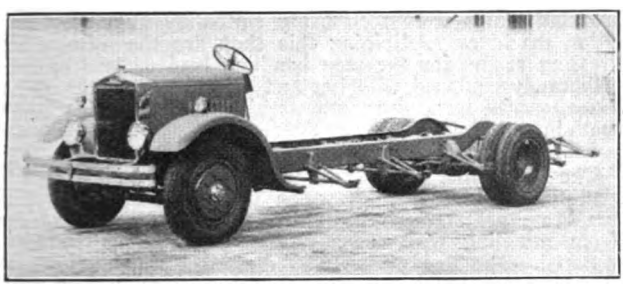
The B.A.T. Cruiser Chassis.

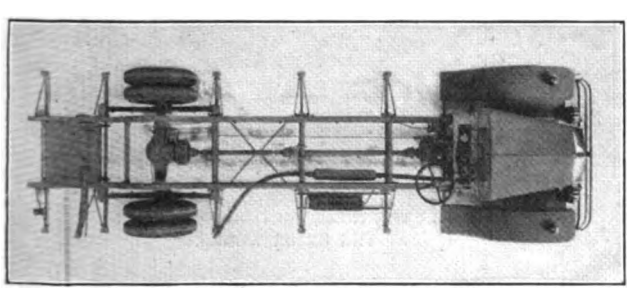
The very businesslike chassis shown in the accompanying illustrations is the product of Harris & Hasell, Ltd. (British Associated Transport), of 24-32 St. George's Road Bristol, and 79/89 Pentonville Road, London, N.1. It is built for a gross load not to exceed 50 cwt. or is suitable for a 20-seater passenger body. It has a six-cylinder engine cast *en bloc;* bore, 3⅜ in.; stroke, 4 in.; 27.3 h.p. R.A.C. rating, developing 59 h.p. at 2,600 r.p.m. The pistons are aluminium



HALF FRONT VIEW—NEAR SIDE.

alloy with three compression and one scraper rings. The balanced crank-shaft runs in seven white metalled bronze backed bearings. The valves are side by side, and are made of special alloy steel. The camshaft is driven off the crank-shaft by a silent 1½ in. wide chain of ½ in. pitch. Lubrication is by submerged gear type pump driven off the cam-shaft by spiral gears, and supplies oil under pressure to the main bearings, connecting rods, camshaft bearings and timing gear chain. Ignition is by "Delco-Remy" high tension coil with distributor driven by an extension of the pump shaft, with manual and semi-automatic spark control. The carburetter is the Zenith of the latest pump type mounted close up to the induction manifold. Cooling is by a large honeycomb radiator, independently mounted and insulated from the solid nickel sheet cowl which is of attractive design. Cooling is assisted by fan, and the water is circulated by a centrifugal pump. The temperature is adjusted by radiator shutters automatically controlled by a thermostat fitted in the top of the tank. The temperature is recorded on the radiator tank.

Power is transmitted through a single plate dry type clutch to



AERO VIEW.

a four speed gear box on which provision is made for a mechanical tyre pump. The gear ratios are: 1st, 6.6 to 1; second, 3.74 to 1; third, 1.84 to 1; fourth, direct; reverse, 7.86 to 1. The entire unit, gear box, engine and clutch housing has three point suspension.

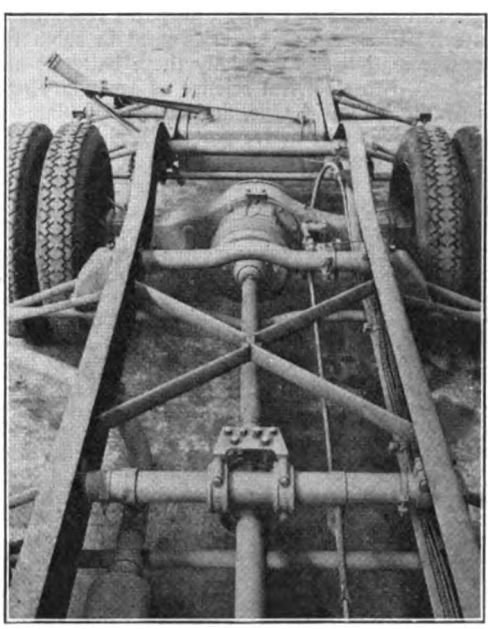
A divided tubular propeller shaft with three Hardy Spicer joints, totally enclosed, transmits the drive to the rear axle. The shaft is supported at the centre by a double ball self-aligning heavy duty bearing mounted in a specially designed three point suspension housing and rubber insulated. The whole of the power line is therefore insulated from the frame.

The rear axle is the spiral bevel fully floating type, and the drive is transmitted through the springs to the frame. The bevel reduction is 5.83 to 1. The housing is of cast steel with pressed-in special alloy steel tubes carrying the heavy duty taper roller bearings.

Service brakes operated by pedal are of the hydraulic internal expanding two shoe type acting in large diameter drums on all four wheels. The emergency brake operates in a ribbed steel drum mounted on the bevel pinion shaft of the rear axle. The front axle has been specially designed for front wheel brakes.

The springs are semi-elliptic, the front being overslung and 38 in. long, and the rear 54 in. long and underslung. The springs are carried on brackets which are carried on extensions of the tube cross members. All the pins and shackles are lubricated from the central system.

The frame consists of deep pressed steel parallel side members, tapered at front and rear and arched over the rear axle with a 5 in. drop behind the axle, the front cross member supporting the radiator is of pressed steel inverted "U" section. A feature of the tubular cross member construction is the arrangement of out-rigging incorporated in the design. Other special features are the absence of rivets and the fitting of high tensile steel bolts in reamed holes.



SEMI-PLAN VIEW—TRANSMISSION AND REAR AXLE.

A 20-gallon fuel tank is carried in the rear of the frame. A feature of the tank is that an independent tube unites the top and bottom plates to carry the filler tube. There is a petrol gauge on the instrument board.

Steering is of the worm and nut type with variable leverage. The steering column is adjustable.

The wheels are steel disc fitted with eight stud mountings and 32 in. by 6 in. pneumatic cord heavy duty tyres, single front, twins rear.

The chassis lubrication is by the Tecalemit oil gun system, which is so arranged that all difficult points are fed through pipe lines grouped together in an accessible position. Starting and lighting is by the "Delco-Remy" six-volt system and a large Exide battery carried on the frame.

The standard equipment includes twin spring steel front bumpers, domed steel front wings, radiator thermometer, two head lamps, two side lamps and a combined "stop" and tail lamp.

The dimensions are:—Wheelbase, 14 ft.; front track, 5 ft. 1¼ in.; rear, 5 ft. 2 in.; dash to centre of rear axle, 11 ft. 9 13/16 in.; dash to end of frame, 16 ft. 9 13/16 in.; length overall with front bumper, 21 ft. 5¾ in.; height to top of frame laden, 2 ft. 0½ in.; weight of chassis 42 cwt.; price at Bristol works, £545.

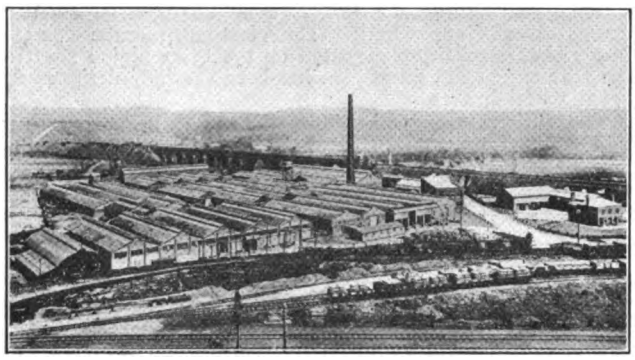
Where Exide Batteries are made.

In Company with other journalists on September 10th, we paid a visit to the Exide and Chloride battery works at Clifton Junction near Manchester, as guests of the Chloride Electrical Storage Co., Ltd., over which works we made a very interesting tour of inspection.

The firm are the manufacturers of the well-known Exide batteries for motor cars and wireless as well as accumulators



GENERAL VIEW OF EXIDE WORKS.

of all sizes and designs and for all purposes from police hand-lamp batteries to the giant batteries used in submarines and central power stations. Essentially these batteries are all of one type, known to electrical science as secondary or storage batteries of the lead-acid type, and consist of plates or grids holding lead oxides (the active material) which are immersed in dilute sulphuric acid (the electrolyte) contained in suitable receptacles. These storage batteries serve as storage tanks of electrical energy. Plates of positive and negative polarity are in each cell or compartment of the container. Electricity is passed into the cells, causing electro-chemical action, which sets up a difference of electrical pressure or potential between the positive and negative plates. When subsequently the plates of opposite polarity are joined together through an external circuit, current flows through the circuit, and will continue to flow until this difference of electrical pressure in the plates has levelled up, or until the circuit is disconnected.

The most important feature of the storage batteries is the plates. Some batteries must give heavy discharges for short periods, and some for long periods without being re-charged; some work requires only a light discharge from the battery, and the length of time between charges varies between different duties. Consequently the battery maker who supplies batteries for every purpose must produce a variety of plates endowed with different properties for widely different purposes, yet all obtained by the use of lead and lead oxides for his active materials. The amount of electrical energy a battery will store is governed by the surface area of active material accessible to the acid. Many thin plates in the cell give a large active area capable of dealing with heavy currents; a few thick plates give a small current for a long period.

Four general types of batteries are made at Clifton Junction—Chloride and Chloride Plant batteries for stationary installations; Lux batteries for lighting railway trains; Exide-Ironclad batteries which are used for the underwater propulsion of submarines, for land traction, such as propelling electric vehicles, and also for lighting motor buses and motor coaches.

Dealing with the Exide battery—the grid made of antimonial lead will hold securely continuous ribbons of active material applied in the form of paste. Work is done by the active material only, the grid being purely a retainer and conductor. The porous ribbed wood separators filling the space between the positive and negative plates prevent internal short circuiting. In the Exide-Ironclad the positive plate comprises a number of vertical pencils joined at the top and bottom to horizontal bars. Each pencil contains a core surrounded by the active material—peroxide of lead—and this is enclosed in a cylindrical tube of ebonite having horizontal slits which allow the electrolyte access to the active material. Each tube has two vertical ribs projecting on opposite sides at right angles to the face of the plate. These act as supports and as insulating spacers and allow the use of a plain wood diaphragm separator.

The first shop to be visited was the moulding department, where various lead components of batteries are made. Next, we inspected the mechanics' shop, one half of which is devoted to repairs and maintenance jobs, and in the other half are made the special moulds and tools used throughout the work. In the next shop, the ebonite tubes used in Exide-Ironclad plates were seen being slitted by high speed precision machines. Adjoining this shop are the washing and dressing rooms for the men handling lead or lead oxides—elaborately equipped with hot and cold shower baths, special soaps, special jets for mouth washing, and cases for private tooth brushes. Close by are the ambulance room and doctor's room.

The next process inspected was the filling of Exide-Ironclad tubes with red lead, which forms the active material. Elaborate precautions are taken here to prevent lead dust from mingling with the air, and the floor is constantly watered. The visitors were conducted through shop after shop, each devoted to some special process in the manufacture of the batteries.

The feature of the works generally is the scrupulous cleanliness and elaborate precautions taken to prevent lead poisoning. There is a test house which carries out research work and capacity and continuous life tests on batteries. In the chemical laboratory, raw materials, acids and waters are tested and chemical tests are conducted in connection with research work.

The Company utilises its own fleet of battery-propelled vehicles for transport between Clifton Junction and the

VIEW OF THE HOME PACKING DEPARTMENT AT THE EXIDE WORKS.

Manchester Ship Canal Docks at Trafford Park. The internal transport of the works is handled by battery-propelled trucks. The works of the Company occupy 37 acres in area, and afford direct employment for 2,000 people, besides thousands in other industries who are kept occupied by the huge contracts for material placed by the company. There are branches also in London, Manchester, Birmingham, Bristol, Glasgow, Dublin, Belfast, Bombay, Calcutta, Sydney, Christchurch, Capetown and Copenhagen.

Parking Charges.—The Parking Committee of the Newbury Corporation has adopted the following new scale of charges for the parking of chars-a-banc at the Wharf:—Not exceeding 1 hour, 1s.; exceeding 1 hour but not exceeding 3 hours, 2s.; exceeding 3 hours but not exceeding 5 hours, 2s. 6d.; every hour exceeding 5 hours, 6d.; maximum charge, 5s.

A.E.C. Announcement. — The Associated Equipment Company, Ltd., has disposed of its interest in Rushton Tractors, Limited. Mr. G. Rushton, desiring to devote himself to the interests of that Company, has resigned his position as General Manager, but he will continue his connection with the Company in a consultative capacity.

Omnibus Demonstration at Great Yarmouth.

In connection with the annual conference of the Municipal Tramways and Transport Association, held at Great Yarmouth, September 11th to 13th last, there was held an omnibus demonstration of a very comprehensive description, practically all the leading commercial motor manufacturers taking part.

The following are brief descriptions of the exhibits:—

Albion Motor Car Co., Ltd., Scotstoun, Glasgow. The exhibit consisted of a single deck 32-seater bus mounted on the latest six-cylinder Albion chassis. The chassis was the 36/90 h.p. six-cylinder model introduced at the beginning of this year, many of which are on the road giving good service both under long distance and urban conditions. The engine has an unique lubrication system which ensures adequate supply of clean oil to all working parts. The clutch is of the usual Albion single disc design, very light in operation. The underslung worm axle is of patent Albion construction providing a high factor of safety. The chassis is of the forward control type, and the machine is mounted on 38 in. by 8¼ in. balloon tyres. The body has an exceedingly attractive appearance, and has an entrance at the rear and the emergency door on the off-side behind the driver's seat. The driver's cab is arranged to float entirely off the chassis, the off-side front wing being suspended from the cab. The rear end of the roof is well domed, whilst the front end has a destination indicator built in, arranged to operate from the driver's seat. The seats are of the semi-bucket type upholstered in moquette and mounted on steel supports. The interior panels are lined with leather cloth and the roof is white enamelled. Eight windows are made to drop. The fittings include duralumin hand poles, Numa air bell with four pushes, Pyrene fire extinguisher and electric windscreen wiper. A full electric lighting set, including 9 interior lights, is fitted.

Associated Equipment Co., Ltd., Windmill Lane, Southall, Middlesex. The exhibit consisted of one of the A.E.C. "Reliance" chassis upon which was mounted a 30-seater single deck bus chassis with double entrance. This chassis is provided with a 95 h.p. 6-cylinder engine. The front entrance door is of the jack knife type and is controlled by the driver. The high backed seats are all upholstered in real leather, as is also the driver's seat in the completely enclosed half cab. Polished walnut has been used for the mouldings, and black Doverite for the grab handles and poles. The majority of the windows are of the drop variety, and there is also a sliding window in the front bulkhead to facilitate communication between driver and conductor or passengers.

Bristol Tramways & Carriage Co., Ltd., Tramways Centre, Bristol. The exhibit consisted of one of the well-known Bristol 32-seater Superbuses which is of the half-bonnet type, giving complete accessibility to the engine, all valves, magneto and carburetter being adjusted from the near side. The engine is the G.W. type 4-cylinder model, 4½ in. bore by 5½ in. stroke, developing 32/52 b.h.p. at 1,000 r.p.m. and 75 b.h.p. at 2,000 r.p.m. The cylinder casting is monobloc with detachable head. The connecting rods are duralumin and the pistons are aluminium. The detachable head is the Ricardo design. Lubrication is pressure feed by submerged gear pump. The clutch is the dry plate type asbestos lined. Four speed gear box and all shafts on ball and roller bearings. Tubular propeller shaft to underslung worm driven back axle. Disc wheels for 36 in. by 8.25 in. low pressure tyres, twin rear. Four wheel foot brakes in rear wheels only. Steering worm and quadrant, forward drive. C.A.V. lighting set.

Crossley Motors, Ltd., Gorton, Manchester. The Crossley exhibit consisted of three vehicles as follows:—(1) A 38/110 h.p. 6-cylinder special low built 50-seater double deck covered top omnibus with enclosed staircase. The seating capacity in the lower saloon is for 24 passengers and for 26 in the upper saloon. The overall height loaded is 12 ft. 10¾ in., the height of the loading platform from the pavement is 9 in., height from floor to floor lower saloon 5 ft. 10 in., height from floor to roof of upper saloon 5 ft. 8 in. The chassis is of special design for low built double deck bodies. The engine develops 52 h.p. at 1,000 r.p.m. and its maximum output is 110. The second exhibit consisted of a 32-seater single deck service omnibus. The body is similar to those which the firm are supplying to the Manchester Corporation Tramways, the engine is similar to that fitted to the double deck bus chassis. The third exhibit was a 30/70 h.p. 4-cylinder 32-seater service omnibus similar to those supplied to the Corporations of Leeds and Manchester.

Daimler Co., Ltd., Daimler Works, Coventry. The Daimler exhibit consisted of a 26-seater saloon coach, a 34-seater service bus and a 22-seater parlour coach. The coachwork of the first mentioned was by Weymann Motor Bodies, Ltd., and of the other two by Short Bros., Ltd. All were mounted on the Daimler model C.F.6 100 b.h.p. chassis recently described in detail in these pages.

Dennis Bros., Ltd., Guildford. Three Dennis vehicles were shown, namely, an F.S. parlour coach, an E.V. single deck bus and an H.S. covered top double deck bus. Each was a low load line chassis equipped with vacuum servo-operated brakes and powered by a spring mounted engine driving through a four speed gear box to the inverted worm type rear axle, the entire transmission following a straight line when the vehicle is normally loaded. The F.S. type provides a high degree of luxury, each passenger being accommodated in an exceptionally comfortable seat and having the use of a folding table. Two doors are provided on the near side. The interior woodwork is mahogany finished and the upholstery is of green leather. The Rochdale Corporation have placed no less than five repeat orders for this class alone, and numerous repeat orders also have been received from the Corporations of Accrington, Cardiff, Colchester, Leeds, Nottingham, and Portsmouth. The H.S. Dennis is a covered top double decker seating 50 passengers and the overall height is only 13 ft.

W. & G. du Cros, Ltd., Acton, London, W.3. The exhibit consisted of a 32-seater saloon omnibus mounted on a W. & G. corporation model chassis providing low loading. The engine is a 6-cylinder "L" head type of 38 h.p. R.A.C. rating developing 40 b.h.p. at 1,000 r.p.m. and 80 b.h.p. at 2,000 r.p.m. The chassis dimensions are as follows:— Loading line with 36 in. by 6 in. tyres 2 ft. 2 in.; wheelbase 15 ft. 7½ in.; track 5 ft. 8½ in.; overall length 23 ft. 7 in.; dash to end of frame 19 ft. 4⅜ in.; back of driver's seat to end of frame 19 ft. 4⅜ in.; overall width 6 ft. 6 in. over front wheels and 7 ft. over rear wheels. Four speeds are provided and the gear box is unit with the crankcase. The rear axle is the inverted worm driven type. Four wheel brakes Dewandre assisted are fitted as standard.

Richard Garrett & Sons, Ltd., Leiston Works, Leiston. This firm exhibited their "O" type electric trolley bus chassis. The frame is of 35 tons high tensile pressed steel. Special attention has been given to the design of the springs which are of silico manganese steel. The front springs are 4 ft. 6 in. long and the rear springs 5 ft. 6 in. The front axle is of the centrepoint steering type. The rear axle is worm driven and of the full floating type. The road wheels are disc fitted with Dunlop pneumatic tyres, twins on the rear wheels. All four wheels are fitted with brakes, one set on the front wheels and two independent sets on the rear wheels. The motor is of the ventilator type 60 h.p. at 1,060 r.p.m. and is in accordance with the B.E.S.A. specification. The controller is of the drum type providing 10 speeds forward and a reverse.

Gilford Motor Co., Ltd., 465 & 471a, Holloway Road, London, N.7. Two vehicles were exhibited, namely, Gilford 16 ft. 6 in. O.T. chassis upon which was mounted a 32-seater service omnibus body by Wycombe Motor Bodies, Ltd., and mounted on a similar chassis was a 26-seater De Luxe saloon body by United Automobile Services, Ltd. The 32-seater body is fitted with semi-bucket seats, the main entrance is of the folding door type on the nearside front and there is an emergency door in the back panel. The driver's door is on the off-side forward. The fittings include an illuminated "Eco" roller type destination indicator, 8 interior roof flood lamps with two parking lamps to the front canopy and two ruby lamps to the back dome, a driver's mirror and automatic windscreen wiper, interior ventilators and communication bell. The interior finish is carried out in mahogany colour. The 26-seater is of particularly smart appearance with metal domed back. The sides of the roof are of sheet metal. The destination box is built into the front canopy. The general scheme of decoration is blue. Armchair seats are provided.

Guy Motors, Ltd., Fallings Park, Wolverhampton. Four vehicles were exhibited, one being a 60-seater double deck bus. The 60-seater chassis is fitted with the Guy patented 56/96 h.p. engine mounted upon the Guy patented flexible sub-frame. Transmission is through a single disc fabric lined clutch to a four speed gear box and the final drive is by two underslung worms on fully floating rear axles. Bogie mounting is adopted for the four rear wheels and there are two inverted semi-elliptic springs on each side. Both hand and foot brakes act on the four rear wheels, the foot brake being assisted by a vacuum servo. The second vehicle shown was a 38-seater single deck bus mounted on a similar type of chassis to the above. A Committee saloon bus was shown designed to accommodate 14 passengers, there being 10 swivel armchairs and a settee and a folding table along the centre of the saloon, hat racks in the roof and panelled cupboards for glass, etc. An FC 32-bus was shown. It is fitted with the Guy patented 6-cylinder engine developing 50/85 h.p. There were also two examples of the Guy trolley bus chassis. One being a six-wheeled double decker and the other a four-wheeled single decker.

Hall, Lewis & Co., Ltd., Abbey Road, Park Royal, London, N.W.10. A 50-seater covered top enclosed staircase omnibus body was shown by this firm mounted on a Maudslay chassis. The complete laden weight of this bus does not exceed 9 tons, the body weight being not more than 2 tons 5 cwt. Ventilation had been carefully considered. Moonstone lamps are in the roof of both saloons; the interior is carried out in silver and walnut.

Karrier Motors, Ltd., Karrier Works, Huddersfield. The exhibit consisted of the firm's popular rigid six-wheeler known as the Karrier "WL6" model. It provides comfortable single deck accommodation for 37-40 passengers. It is built with alternative wheelbases of 17 ft. 6 in. and 19 ft. and can accommodate roughly 25 per cent. more passengers than the largest single deck four-wheeler. It has forward driving and a 6-cylinder side valve engine which develops 60/80 h.p. and carries all its auxiliaries on the near side; a four-speed six-bearing gear box, two-piece tubular propeller shaft, and worm driven rear axles of bogie construction; vacuum "Servo" brakes and lubrication from a large reservoir with a spring loaded plunger which merely requires pulling up once a day, whilst the wheels, etc., can be quickly greased with a grease gun. The wheels are shod with 36 in. by 6 in. single pneumatics. The body work was carried out by Hall, Lewis & Co., Ltd., and is of the 36-seater centre-gangway type with front and rear entrances on nearside and semi-bucket seats.

Leyland Motors, Ltd., Leyland, Lancs. This firm's products were represented by two vehicles, one being a "Lion" bus for the Preston Corporation and the other being a "Titan" for the Sheffield Corporation. The "Lion" was fitted with a single deck body with accommodation for 31 passengers. The "Lion" chassis is provided with a 4-cylinder engine. The single bus body is of standard design and accommodates the driver alongside the engine. The seating accommodation may be varied from 35 seats on the "Popular" type to 26 seats of the "Comfort" type with different combinations of seating and entrances in each type. Upon the 6-cylinder "Titan" chassis was mounted a double deck bus to accommodate 48 passengers and had an enclosed staircase; this body is an alternative to the original 51 seater with an open staircase.

Maudslay Motor Co., Ltd., Parkside, Coventry. There was shown a single deck 6-cylinder bus to seat 32-passengers and a 50-seater double deck top covered bus. With regard to the single deck omnibus this is fitted with a 6-cylinder monobloc engine, bore 110 m.m., stroke 130 m.m., R.A.C. rating 45 h.p., maximum h.p. 120, developing 100 h.p. at 1,700 r.p.m. Water circulation is by centrifugal pump, lubrication is forced, there being two separate systems under pressure and fully automatic. The lighting dynamo, water pump and magneto are situated in line on the near side of the engine, below the camshaft housing and well above frame. The carburetter is a Solex and ignition is by h.t. Simms magneto. The engine clutch and gear box form a single unit with three point suspension. The clutch is of the single dry-plate type. The gear box is the sliding spur gear and splined shaft type giving four speeds and a reverse. The propeller shaft is of the open type divided midway. The final drive is an underslung worm the ratio being 5.8 to 1 or 6.25 to 1. Steel disc wheels are fitted and the alternative tyre equipment consists of 38 in. by 7 in. high pressure pneumatic or 38 in. by 8.25 in. low pressure pneumatic, twin rear in both cases. The Dewandre foot brake operates on all four wheels. The hand brake acts on the back wheels only. The dimensions are: wheelbase 17 ft. 6 in.; wheeltrack 6 ft. 2¾ in.; front overall length 27 ft.; overall width 7 ft. 5 in.; back of driver to end of frame 22 ft. 7 in.; height of frame 24 in. Chassis weight with equipment 69 cwt. Chassis price £1,205. The chassis specification for the double deck bus is similar to the above except that the engine has 100 m.m. bore and 130 m.m. stroke. R.A.C. rating 30 h.p., maximum h.p. 100, developing 75 h.p. at 1,500 r.p.m.

Ransomes, Sims & Jefferies, Ltd., Orwell Works, Ipswich. The exhibit consisted of a six-wheeled electric trolley bus chassis specially designed to take a body of large capacity, two types of body can be fitted to this chassis, that is, either a single deck saloon with a seating capacity of 40 or a double deck body seating 70 passengers. The motor is of the twin type consisting of two armatures mounted on one shaft, each armature having its own field making system. The motor is rated at a total h.p. of 60/65 and is capable of heavy overloads.

Chas. H. Roe (1923), Ltd., Crossgates Carriage Works, Leeds. This firm were exhibiting two 32-seater single deck omnibus bodies, one having a front entrance mounted on a CF.6 type Daimler chassis, built to the order of the Tees-side Railless Traction Board, whilst the other was of the rear entrance type mounted on a Thornycroft chassis, built to the order of the Gloucester Corporation. The principal points of interest in the construction of these bodies were:—(1) The patent waist rail and pillar jointing. (2) Side panel and roof ventilation. (3) Bumper rail fitted for protection of the side panels and to give additional strength. (4) Folding doors at front and rear fitted with the "Roe" patent bar type door gear.

Short Brothers (Rochester & Bedford), Ltd., Seaplane Works, Rochester. Two examples of this firm's bodywork were shown, one being a single deck saloon body on an A.E.C. chassis and the other being a double deck covered top bus body also on an A.E.C. chassis.

A. J. Stevens & Co. (1914), Ltd., Graiseley House, Wolverhampton. The A.J.S. "Pilot" bus which was sent to the demonstration had normal steering and was fitted with 24-seater service bus body. It was trimmed and painted red and green and was quite an attractive and pleasing looking job.

Herbert E. Taylor & Co., Ltd., Cringleford, Norwich. The vehicle exhibited was not one of the firm's latest models but a vehicle which had done 8,000 miles service for Mr. R. Futter, of the Norfolk Motor Service, Great Yarmouth, it was mounted on a Crossley Eagle chassis.

John I. Thornycroft & Co., Ltd., Thornycroft House, Smith Square, London, S.W.1. This firm showed three vehicles as follows:—(1) A 32-seater type "BC forward" single deck bus, with body by Vickers. This bus is of the service type with front entrance and an emergency exit at rear. Three drop windows on each side operated by the latest type of window lifts, with balance fittings. (2) A 26-seater "BC" sun saloon coach being a luxury type with special sliding centre roof panel. Main entrance at front with second entrance at rear on nearside. All side windows drop and are operated by Rawlings window lifts. (3) A 68-seater type "HC" covered top double deck bus with body by The Brush Electrical Engineering Co., Ltd. The chassis for this vehicle was the "HC" type rigid six-wheeled low loader comprising a 6-cylinder 58/85 h.p. engine, double plate clutch, 4 speed gear box and full floating back axles with Thornycroft patent suspension.

Tilling-Stevens Motors, Ltd., 5, Iddesleigh House, Caxton Street, Westminster, London, S.W.1. There were two vehicles sent by this firm, one being a type T.S.17A. four wheel petrol-electric chassis with 16 ft. wheelbase and the other a 32-seater front and rear entrance omnibus mounted on the well known B.10.A.2. "Express" forward steering gear driven chassis with 16 ft. wheelbase. Dunlop 38 in. by 7 in. pneumatic tyres and C.A.V. "M" type electric lighting equipment. The bodywork for the "Express" chassis was carried out by Metcalfes (London), Ltd., of Romford.

United Automobile Services, Ltd., Laundry Lane, Lowestoft. There was exhibited a 32-seater "United Built" service saloon mounted on an A.E.C. chassis. This vehicle is constructed on standardised lines and as a result the firm have been able to produce a sound, well constructed service vehicle at an attractive figure. Another vehicle was a 26-seater "United Built" long distance saloon mounted on a Gilford 16 ft. 6 in. O.T. chassis. A very attractive vehicle with domed back.

Digitized by Google

Vulcan Motor & Engineering Co. (1906), Ltd., Crossens, Southport. The Vulcan exhibit was as follows:—(1) A "Duchess" 26-seater omnibus the chassis of which has an upswept frame, front and rear specially designed to obtain a low loading height. The engine is a 25/60 h.p. 6-cylinder with a bore of 3¼ in. and a stroke of 4¾ in., R.A.C. rating 25.35 h.p. Both front and rear springs are long and underslung. The body lines are pleasing and distinctive and the seating provides great comfort. (2) A "Prince" 32-seater omnibus. This chassis also has an upswept frame front and rear; a 6-cylinder engine giving 37.2 h.p. R.A.C. rating; the driver is placed beside the engine and the body is well built and well finished. This type of bus is suitable for express service, being fast, reliable, economical and comfortable. (3) An "Emperor" double deck 51-seater omnibus which is the latest addition to the Vulcan range. It has a 6-cylinder engine of ample power; the staircase is totally enclosed and a sunken gangway runs along either side of the upper deck.

Waveney Co., Ltd., Stanley Road and Heath Road, Oulton Broad, Lowestoft. This firm exhibited a 20-seater body with semi-bucket seats trimmed in leather.

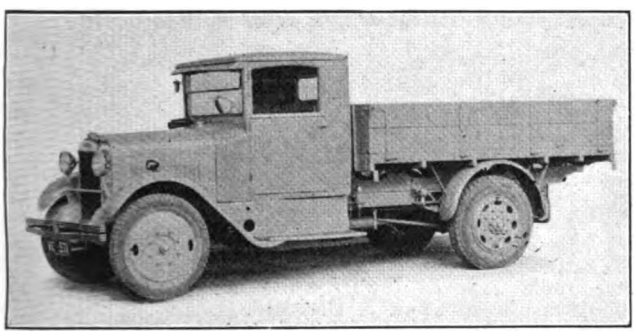
Wycombe Motor Bodies, Ltd., High Wycombe, Bucks. This firm exhibited a 32-passenger single deck bus fitted with semi-bucket seats mounted on a Gilford 16 ft. 6 in. O.T. chassis, having front entrance and rear emergency door.

The Singer 2-Ton Industrial Chassis.

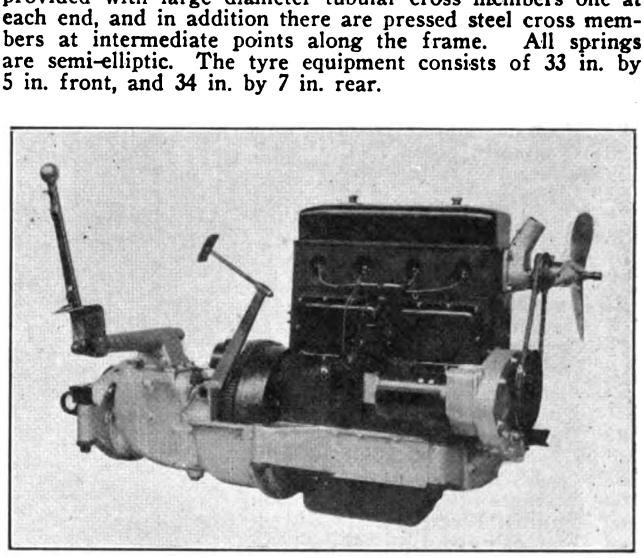
THE latest firm to enter the commercial motor manufacturing field is the firm of Singer & Co., Ltd., Coventry, one of the oldest established and one of the largest of British motor car manufacturers.

The chassis just placed on the market by the Singer Company is intended for 2-ton loads or for passenger bodies to accommodate 20 passengers. The price of the chassis is £425. The weight of the chassis itself is 1 ton 19½ cwt.

The engine is a 4-cylinder monobloc casting, built in unit with the gear box. It is bolted to a sub-frame at six points, the sub-frame being attached to the chassis at three points. The cylinder bore is 90 m.m. and the stroke 120 m.m., the cubic capacity being 3,053 c.c. It is provided with a quickly detachable head. Push rods operate overhead valves, and the detachable cylinder is of the turbulent type. It is stated that at 3,000 r.p.m. the engine develops nearly 60 b.h.p. The overhead valve mechanism is entirely enclosed by a pressed aluminium cover as shown in the accompanying photograph. The combustion chambers have a high compression ratio, and are completely machined to ensure uniformity of compression between each cylinder. The engine casting is very robust and carries the crankshaft in five bearings. The flywheel housing is open in order to give ready access to the clutch and operating mechanism. Forced lubrication is provided to all the bearings, including the overhead valve gear. There are no oil pipes, the oil being forced through ducts cast and drilled in the crankcase. The oil passes through two filters, one of which is a suction filter in the sump, and the other an "Auto-Klean" filter. Cooling water is circulated by a rotary pump through a gilled tube radiator with horizontal fins. Petrol is gravity fed from a 10-gallon tank on the dash.



THE NEW 2-TON SINGER TRUCK.



THE COMBINED ENGINE AND GEAR BOX UNIT OF THE NEW 2-TON SINGER INDUSTRIAL CHASSIS.

Power is transmitted through a single plate clutch to a four speed gear box with right hand change, and provision is made for fitting a mechanical tyre pump. The gear ratios are:— Top speed, 1 to 1; third speed, 1.62 to 1; second speed, 2.76 to 1; first speed, 5.36 to 1; and reverse, 7.78 to 1. The standard back axle reduction is 6.5 to 1, with an alternative special low reduction of 7.25 to 1.

A 12-volt electric starting motor is mounted on the near side of the engine, and is completely open and accessible, including "Bendix" drive. There is a 12-volt lighting set, comprising a positive drive dynamo, switch-board, side lamps, head lamps and tail lamp.

Power is transmitted through a two-piece tubular shaft enclosed in a torque tube with single flexible joint at the gear box end, and an intermediate bearing at the centre. The final drive is the overhead worm type. The rear axle is fully floating. The front axle is an "H" section steel stamping. The hubs are mounted on taper roller bearings, easily adjustable for wear.

Brakes are fitted on all four wheels as standard equipment, these being operated by pedal assisted by vacuum servo. Central adjustment in a convenient position is provided. The hand brake operates in rear brake drums. Steering is the Marles type. The frame is of pressed steel channel provided with large diameter tubular cross members one at each end, and in addition there are pressed steel cross members at intermediate points along the frame. All springs are semi-elliptic. The tyre equipment consists of 33 in. by 5 in. front, and 34 in. by 7 in. rear.

Lubrication to all points of the chassis, with the exception of the main units, is provided for by the Luvax central foot operated lubrication system which consists of an oil reservoir which is connected up to all moving parts of the chassis by pipes, and, by means of a lever, all the various parts are lubricated at the same time.

The chassis equipment includes front wings and step-board, an instrument board with speedometer, lighting and starting switches, oil pressure gauge, petrol gauge, ammeter, ignition switch and dash lamp, a 12-volt lighting and starting set, complete with lamps; electric horn operated from the steering column and spare wheel and tyre.

The dimensions of the chassis are:—Wheelbase, 11 ft. 1½ in.; overall length, 15 ft. 10 in.; dash to rear axle, 8 ft. 10¼ in., dash to end of frame, 12 ft.; chassis weight, 31 cwt.; track front and rear, 4 ft. 11 in.; height laden, 2 ft. 4½ in.; ground clearance, 10 ft. ⅞ in.; turning circle 46 ft.

Goodyear Appointment. — The Goodyear Tyre and Rubber Co. (Gt. Britain), Ltd., whose factory is at Wolverhampton, announce the appointment of Mr. G. Colley as Sales representative for the counties of Norfolk and Suffolk. Mr. Colley has completed a course of training in the Goodyear factory, and succeeds Mr. F. W. Osbourn who has resigned.

Bean Cars.—Bean Cars, Ltd., announce that Messrs. Pass & Joyce (1929), Ltd., of 373-375 Euston Road, London, N.W.1, have taken over the sole distribution for their Commercial Vehicle Sales in the London Metropolitan area, and have taken over their London Depot and Staff at 4a Cambridge Street, Edgware Road, London, W.2.

Commercial Motor Transport Exhibition, Olympia.

November 7—16, 1929.

In view of the near approach of the Commercial Motor Transport Exhibition, which will be held at Olympia from November 7th—16th inclusive, we are publishing a list of the exhibitors up to date, giving the stand numbers of each. In the November issue of this journal we shall have our usual comprehensive report of the exhibits and this number will be published on November 12th so as to be in the hands of our readers in time for them to visit the Exhibition.

Commercial Vehicle and Body Work Section.

Stand No.	
45	Albion Motor Car Co., Ltd.
94	Arlington Motor Co.
39	Armstrong Siddeley Motors, Ltd.
122	Arnold, Wm.
71	Associated Equipment Co., Ltd.

HORSES ON SLIPPERY ROADS.

To the Editor of The World's Carriers.

Sir,—I was very interested in two letters published in the August issue of *The World's Carriers*, and agree with Major General Sangster that it is cruelty to continue to work a horse in the city streets shod in the same old way that horses were shod before street paving was invented. Undoubtedly at the present time there is serious difficulty in obtaining the best use out of a horse owing to the slippery state of the roads, and in addition to the necessity for the non-slip shoeing methods in my opinion it is necessary for horses in these days to be equipped with a suitable rubber pad when traversing slippery roads.

In the same issue a letter from the National Horse Association of Great Britain plainly shows that we have reached a crisis when horses cannot travel along the roads without serious risk both to the animals and drivers. In these days modern roads are surfaced to meet the demands of motorists solely and one must admit that the Authorities have no regard whatever for the presence of the horse on the road. There are numerous occasions when motor vehicles, with all their splendid utilities, cannot possibly take the place of horses, and it therefore behoves every horse lover to take such steps as shall equip the animals to negotiate the roads in safety.

Many experiments have been made with rubber pads with a view to enabling the horse to keep his feet, and some of the rubber pads placed on the market are excellent as a means of lessening concussion, but practically all these are nailed under the shoe as a permanent fixture. There is a serious objection to the pads being a permanent fitting, because the frog and sole are obviously impaired by preventing evaporation of natural moisture, thus keeping the hoof in a state like a poultice.

After examining a number of rubber pads placed on the market, I have come to the conclusion that the best way to equip our horses to traverse the roads with comfort and safety, is to supply them with removable rubber pads which can be taken off should the horse be working in a field or on other places than the slippery roads. The G.B.B. patent removable pads satisfactorily fulfil these requirements, and on reflection seem to my mind the ideal pad both as regards safety for horse and rider, and for keeping the foot in a healthy condition.

Yours faithfully,
H. Howard Robinson,
Secretary,
Manchester Transport (Owners') Association, Ltd.
28 Queen Street,
Albert Square, Manchester.
21st September, 1929.

EDUCATING THE TRANSPORT MAN.

To the Editor of The World's Carriers.

Sir,—I have read with much interest Mr. R. J. Armstrong's letter in your September issue, re educating the transport man, and I quite agree with him that the trade is doing nothing towards training or encouraging the packer and loader. I have always maintained that the packer, loader or foreman is the man that counts, as he can make or mar a job, however clever the estimator may be. Also he needs to be a highly skilled man, to handle and load the hundred and one valuable articles one finds in some of the houses of to-day. I have often been amazed at the foremen employed by some firms, and I think they get through their work more by luck than judgment. I am of the opinion that the removal trade is not attractive to the youth of to-day, owing to the long hours worked, and the low rate of pay. I have a personal knowledge of this, and with the exception of drivers, I do not know of any trade which works their men such long hours. Some folks think it is a soft job, but I would like some of them to try it for a few days, particularly where the removal is to a second or third floor flat. I have recollections of a delivery to a flat in Paris (92 stone stairs) in midsummer, hoofing it up and down all day long (loaded up, down empty), and I have frequently thought if some of the principals and customers had a little of it, they would have a little more feeling for the men that "hump the stuff up and down." I think the slogan of the Association is, "Removing is an expert's job," and I presume those engaged in carrying out same are experts too, and until they are paid an adequate wage and worked reasonable hours, the youth of to-day will not be attracted or be interested in the removal trade.

I remember those journeys in the old days with the horse vans, out in all weathers travelling probably all night, setting to, on our arrival at our destination, to unload, probably wet through, tired and hungry, frequently travelling back home after completion. I admit things have improved in this direction, but there is still room for a deal more improvement to make the job attractive to the right youths.

Yours faithfully,
E. J. Wensley.
Cardiff.
19th September, 1929.

Albion High-Speed 30-cwt. Chassis.—The Albion Motor Car Co., Ltd., Scotstoun, Glasgow, have issued recently an attractive folder dealing with the firm's 30-cwt. chassis. The chassis price including 33 in. by 5 in. pneumatics front, 34 in. by 7 in. pneumatics rear, spare wheel with solid tyre and carrier, 12-volt 5-lamp electric lighting set, electric horn, front wings, and speedometer, *ex works* is £390. The Albion high speed 30-cwt. will be on view on Stand No. 45, at the Commercial Vehicle Show, Olympia, 7th to 16th November next. The London office of the Company is at Bank Buildings, 20 Kingsway, London, W.C.2.

Wages of Busmen.—At the Watch Committee of the Stoke-on-Trent Corporation, the town clerk submitted a further communication from the Transport and General Workers' Union regarding wages paid to drivers and conductors, and the Sub-Committee interviewed Mr. Henry Jones, secretary of the Associated North Staffs. Motor Bus Proprietors, together with a number of private owners. Mr. Jones, on behalf of the Association, gave a definite undertaking that the trade union rate of wages and hours of duty as recognised by the Potteries Electric Traction Co., Ltd., should be put into operation immediately by the Association.

The Port of London.

Tilbury Docks Improvements.

It is not easy to remember that Tilbury, twenty-two minutes journey by train from Fenchurch Street Station, and twenty-six miles below London Bridge, is an integral part of the Port of London! Still less is it always realised that the authority of the P.L.A. in conjunction with the City Corporation extends up the river as far as Teddington. There is no other port in the world to be compared with it in more ways than one.

LADY RITCHIE OPERATING THE SOLID SILVER LEVER FROM THE TOP DECK OF THE S.S. "ORONSAY," WHICH OPENED THE GATES TO THE ENTRANCE LOCK. LORD RITCHIE IS SEEN ON THE RIGHT.

Thursday, September 25th, witnessed the consummation of three years of increasing work, which placed London once again in the forefront of the great ports of the world.

Those who were privileged to take part in the opening of the new lock at Tilbury Docks, which was performed by Lady Ritchie, wife of Lord Ritchie, of Dundee, Chairman of the Port of London Authority, will not soon forget the occasion, a glorious summer's day, brilliant sunshine, and clear blue skies, with airplanes flying overhead, crowds of eager school children, sailor boys and the general public lining both sides of the new lock, made interesting background, or rather sideground, to the ceremony.

At 1.30, the 20,000 tons Orient liner "Oronsay" was waiting outside the great railway and road bridge forming the entrance to the lock.

Electrical connection was made with the shore, and at 2 o'clock Lady Ritchie, by operating a miniature control apparatus on deck, raised the bridge which opened in the centre to the accompaniment of detonators and the music of syrens of all sizes and notes from the ships, big and little, in the docks, and the big ships passed into the lock with ample room to spare. After waiting for the water to rise to the level of the main dock, the lock doors were opened, and the stately vessel passed through, cutting a blue silk ribbon, and made her way, accompanied by four tugs, to her berth, passing on her way three P. & O. liners, and taking her position alongside the Orient liner "Orford," which we last saw in the Solent, gaily illuminated on the occasion of the Schneider Trophy race.

The dimensions of the new entrance lock, which is capable of accommodating the largest vessel afloat, are:—

Length	1,000 ft.
Width	110 ft.
Depth	45½ ft. at high water.

It is situated about 1,200 feet westward of Tilbury Ness, and is aligned in the direction of the strongest prevailing winds. Only slight tidal currents occur at the approach jetties in the river during locking hours. The docks are now able to accommodate the largest ships yet built.

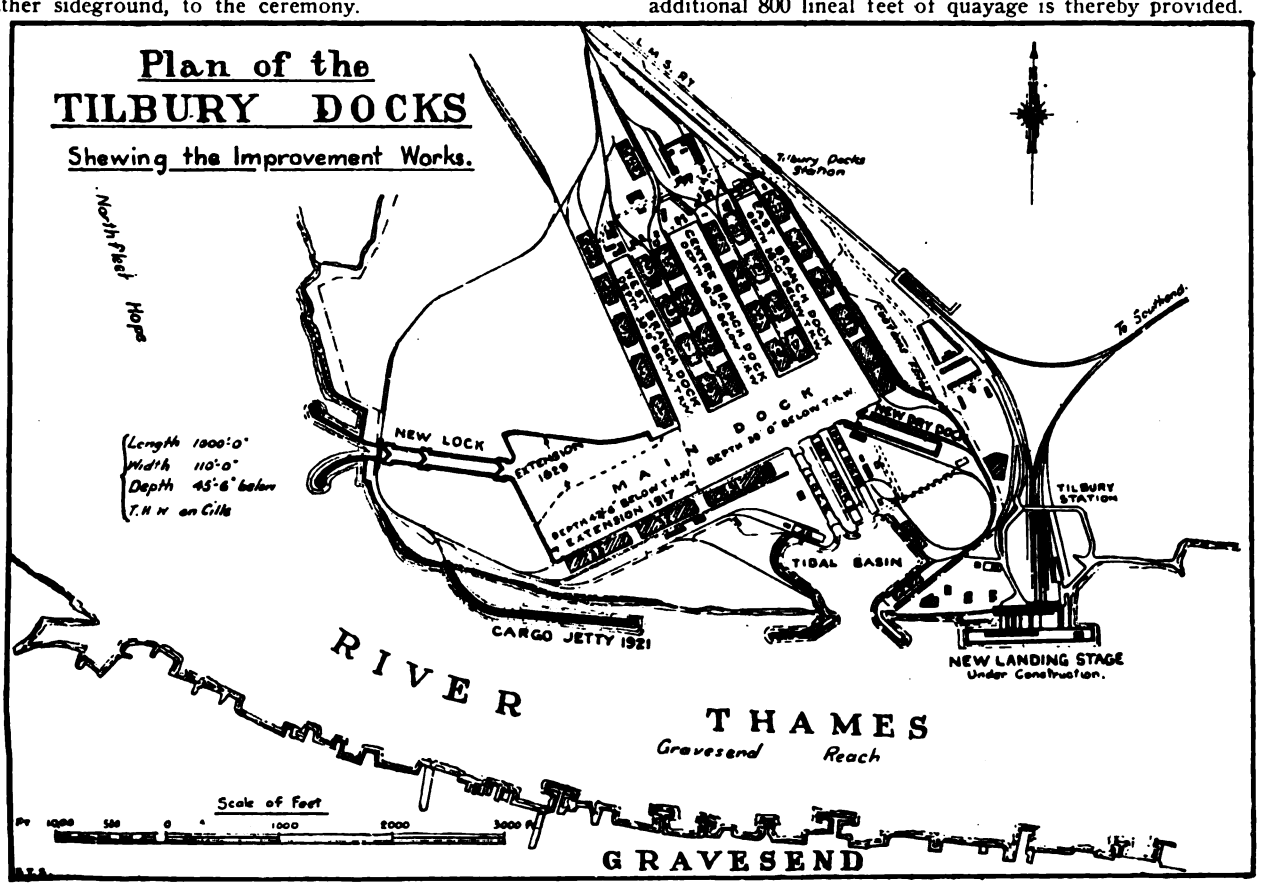
Other new works at the Tilbury Docks involved in the general scheme for their improvement and greater utility, include the provision of a new dry dock, the dimensions of which are:—

Length	750 ft.
Width	110 ft.
Depth	37½ ft. on blocks and on sill.

The dry dock has been so constructed that it can be readily extended when necessary, without interference with its use, to a total length of 1,000 feet.

The railway for goods and passenger traffic has been diverted to the south side of the main dock, and for the first time, road access has been provided to the berths at this end of the docks.

The situation of the new entrance has necessitated increasing the area of the main dock by 15 acres, and an additional 800 lineal feet of quayage is thereby provided.



Digitized by Google

The approximate cost of these works, including the new entrance lock, is £2,550,000.

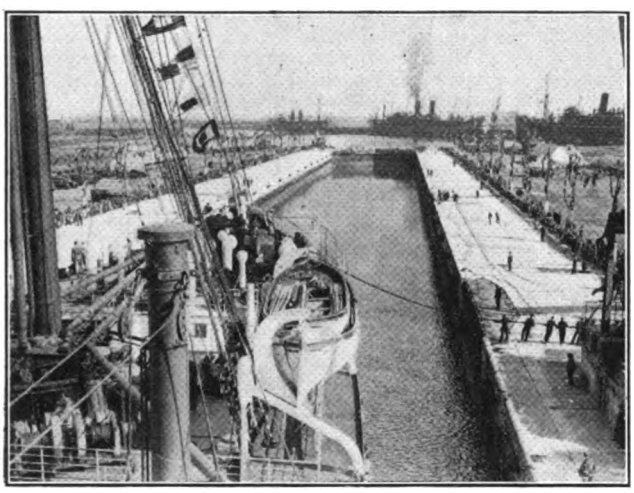
The Port Authority received financial aid towards the carrying out of these improvements from His Majesty's Government through the Unemployment Grants Committee in the form of a grant of half interest for 15 years on the capital expenditure involved.

Materials Used, etc.

The following summary of the materials used and the quantities excavated and dredged, serve to emphasise the magnitude of the work:—

Total quantity of excavation of all descriptions	1,845,000 c. yds.
Dredging	1,250,000 c. yds.
Monoliths sunk	191
Aggregate depth of Monolith sinking	10,200 ft.
Concrete of all descriptions	550,000 c. yds.
Cement	100,000 tons.
Granite	7,000 tons.
Timber (in permanent work)	200,000 c. ft.
Steel (iron work of all descriptions)	16,000 tons.

With the exception of timber, British materials have been used exclusively throughout the whole of the improvement work.



A STRIKING VIEW OF THE NEW ENTRANCE LOCK AS SEEN FROM THE S.S. "ORONSAY" AT THE OPENING OF THE NEW TILBURY LOCK.

The whole of the Tilbury Dock improvements were designed and executed under the direction of the Port Authority's Consulting Engineer, Mr. Frederick Palmer, C.I.E. Mr. Palmer was formerly the Chief Engineer of the Port Authority, and is now a partner in the firm of Messrs. Rendel, Palmer & Tritton.

The works have been carried out under the direct supervision of the Authority's New Works Engineer, Mr. F. W. Davis, who, as Resident Engineer for these works, has been assisted by Mr. W. Mackenzie.

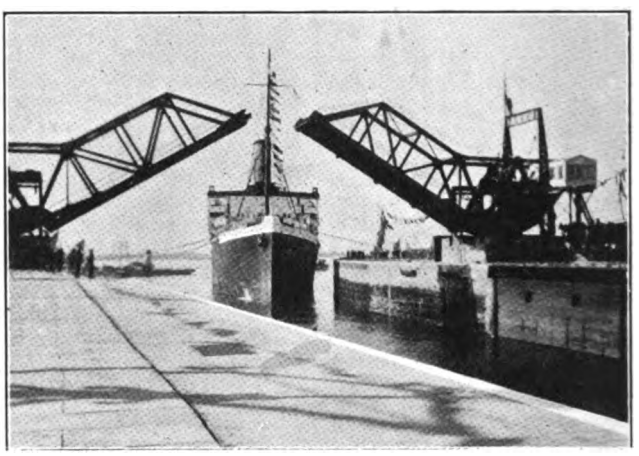
The Tilbury improvement programme was originally timed for completion by 1930, but the work has been finished approximately twelve months before the scheduled time. The number of men employed on the actual site reached a maximum of 1,700. The work, of course, gave employment to many other men, who were engaged on the fabrication of materials, etc., in various parts of the country.

Tenders were invited for each item of the Tilbury Docks improvement scheme, and eventually the whole of the work was placed in the hands of Sir Robert McAlpine & Sons (London), Ltd.

The opening of the new entrance lock at Tilbury, may be regarded at the commencement of a new era in the history of the Tilbury Docks and it is well to recall to mind the fact that those docks which were first opened for business 43 years ago, were in the nature of a very bold experiment, which proved eminently successful.

No structural alteration was made to Tilbury Docks until the early days of the Port Authority, who, in 1917, extended the main dock for a length of about 1,450 feet. Now the total water area of those docks is 104 acres, including the tidal basin, and the depth is 38 feet. In addition to the original twenty-four transit sheds, there are others—one 570 feet by 120 feet, and one 395 feet by 120 feet in the branch docks, and three each 600 feet by 120 feet, on the south side of the main dock, all available for goods discharged from or to be loaded into vessels. Like most of the other docks, the Tilbury Docks are furnished throughout with railway lines in direct communication with all parts of the United Kingdom.

In addition to the Tilbury Docks improvements, the Port Authority have nearly finished the construction of a passenger landing stage in the river at Tilbury. The reproach has been levelled against London that there are within the Port no special facilities, such as exist, for instance, at Liverpool, in the way of a floating stage for the landing and embarkation of ocean-going passengers. Those passengers now either join or leave their steamers at the particular dock berth used by the ship, or are taken by steam tenders from or to the small cross-river ferry landing stage at Tilbury, belonging to the London Midland and Scottish Railway Company.



Photo] [World's Carriers.

THE BASCULES OPENING TO ADMIT THE S.S. "ORONSAY" INTO THE NEW LOCK.

The Port Authority, in cordial co-operation with the Midland Railway Company (now part of the London Midland and Scottish Railway system), obtained Parliamentary powers, under the "Port of London and Midland Railway Act, 1922," for the construction of a passenger landing stage at Tilbury, and the necessary works in connection with it. The scheme was started in 1926, and it embraces a floating stage 1,142 feet long, on the site of the old ferry stage. For the cross-river traffic, a length of 300 feet will be reserved, and the remainder will be devoted to ocean passengers. The requisite gangways and bridges have been erected between the stage and the river bank, and on the shore, the erection of a commodious Customs baggage examining shed has been nearly completed. The railway company are adapting their station to cope with increased traffic, and a large circulating area or hall for passengers is being added to the station. All this, which involves a capital outlay on the part of the Port Authority of £376,500, in addition to a large expenditure by the railway company will undoubtedly make London a more attractive and comfortable port for overseas passengers. The works are so designed that at any time the accommodation may be doubled so as to cope with any increased flow of traffic that may come.

Neyland Ferry Service in Danger.—Mr. Frederick Hutchings, owner of the Neyland-Hobbs Point ferryage system, which links north and south Pembrokeshire over Milford Haven, has intimated to the Pembrokeshire County Council that unless some arrangement is made with him and improvement made in the landing stages he will be compelled by the lesser winter trade to suspend the winter service. Traffic in winter, he states, is much less than in summer. The County Council has decided to ascertain for what figure the pontoons could be purchased and a negotiating committee with Mr. Hutchings has been appointed.

Bristol Channel Ports Competition.—Although at a recent meeting of the Bristol City Council attention was drawn to the proposed Great Western Railway expenditure of £4,000,000 at Cardiff Docks, which, it was stated, would menace Bristol trade, little is known of any such proposed step in Welsh shipping circles. The stated intention of the Great Western Railway Company to make Cardiff a deep water dock at all tides proves to be no more than a mere suggestion made by the Cardiff City Council to the Great Western Railway Company, and the Bristol alarm appears, as yet, unfounded.

London Shipping and Forwarding Agents' Conference.

A meeting of the Council of the London Shipping and Forwarding Agents' Conference was held on 30th September, at the London Chamber of Commerce.

There were present, Mr. M. E. Duffett (President), Mr. H. Gilbert (G. W. Sheldon & Co., Ltd), Mr. F. J. Gerson (Rosenberg, Loewe & Co., Succrs., Ltd.), Mr. W. Narracott (Van Oppen & Co., Ltd.), Mr. E. V. Turvey (Nunzi & Co., Ltd.), Mr. E. Palmer (Northern Transport Agency, (Ldn.), Ltd.), Mr. J. B. Taylor (Immediate Transportation Co., Ltd.), Mr. F. H. S. Rouse (American Express Co., Inc.), Mr. H. K. Coppendale (Morrison, Pollexfen & Blair, Ltd.), Mr. G. Perry (British Commercial Transport Co., Ltd.), Mr. F. W. Challis (Temporary Acting Secretary).

The minutes of the last meeting which had been circulated were taken as read and signed as correct.

Apologies for absence were received from Mr. H. A. Crowe, of Messrs. Crowe & Co. (Ldn.), Ltd., Mr. J. B. Ballantyne, of Messrs. J. B. Ballantyne & Co., and Mr. C. McEwan, of Thos. Cook & Sons, Ltd.

Correspondence.

(a). Letter from a Coventry firm inquiring in the first place as to whether the Conference had been able to establish any *fixed scale of charges* for services rendered by forwarding agents in London, and in the second place criticising a charge of 7s. 6d. made in connection with a particular consignment of machinery, apparently imported. It was decided that the Secretary should reply that no fixed scale of charges was in operation, but that an opinion could more fairly be formed as to the particular charge criticised if full particulars were disclosed.

(b). Letter from a trade Association asking for some idea of the charges usually made by members of the Conference. It was decided that the Secretary should reply that there were no *fixed charges* generally applicable, but that if the Association had in mind the needs of any particular trade, the Council of this Conference would, at any time, be glad to consider proposals representatively.

(c). A letter from the Verein Hamburger Spediteure *re commission for forwarding agents.* The German Association was complaining that its members had no commission paid to them on certain business and had to rely for remuneration upon the rebate system. They alleged that the trouble lay with the attitude of the British Steamship Lines, and suggested that a proposal should be made to the ship owners that 2½ per cent. commission should be payable to the forwarding agent, on the strict condition that it was not passed on to the sender of the goods. The President decided to reply that any pressure which it might be desirable to bring to bear on the Steamship Lines in this matter should, in the first place, come from the Hamburg Association, and that the London Conference would be glad to be kept advised at each stage as to the trend of negotiations, so as to be in a position to assist the more intelligently if the subject should be raised in London through the British Steamship Companies.

(d). Letter from the Verein Hamburger Spediteure regarding co-operation between forwarding agents in London and agents in Germany. This letter—being found to embody a *proposal for the closer inter-working between the members of the Hamburg and the London Associations respectively,* coupled with a suggestion that some financial inducement should be given to German forwarders in consideration of their confining their orders to members of the London Conference—was referred by the Council to the German Section of the Conference for preliminary consideration and report.

(e). Letter from a member asking for information as to the approved and regular *charges for making out certificates of origin* in respect of shipments to the Argentine and Uruguay. The Secretary was instructed as to a reply.

Matters Referred from the German Section.

(a). A question raised by a member who wrote regarding difficulty in recovering *Customs duties overpaid in the case of consignments taken overside* and landed at their *own wharves* for Customs' examination. This firm were asking whether any other agents had experienced like difficulty with themselves in inducing H.M. Customs to consider overpayment refunds on Over Entry certificates tendered in respect of goods landed in such circumstances. It was generally felt that, since these goods were in fact stated to be under Customs watch on the barge, and examined by the Customs at a "sufferance" wharf, they should rank in respect of Over Entry claims in exactly the same category as goods landed for Customs examination at a P.L.A. or any public wharf. It was decided that the Secretary should send a copy of the letter to certain member firms owning wharves of their own who might be able to supply some evidence. Subject to their replies, it was further decided that if the firm raising the matter would give some exact particulars, representations might, at the President's discretion, be made to H.M. Customs.

(b). *Quotations "per thousand kilos."*—It was explained that during the hearing of a recent case in the Courts, some substance was attached to the interpretation of the phrase "per ton," occurring in a quotation in respect of goods originating from Continental towns. Members of this Conference had decided that the phrase meant "per ton of a thousand kilos," and the German Section had advised its members to take care to avoid the use of the phrase "per ton" and to say that their quotations were made "per thousand kilos." They now recommended that the Council of the Conference should arrange for all members of the Conference to be circularised in this sense.

Reports of Chairmen of Sections.

(a). *Air Section.*—The Chairman reported on the recent work of this Section, particularly with reference to an interview which had taken place between representatives of the Section and the Management of Imperial Airways, Ltd., on the vexed question of A/A rates and sundry other matters connected with the transport of goods by air route, principally between London and Paris. The principal feature of the interview had been the friendly attitude of the Company's representatives and their evident disposition to recognise in future the status and machinery of the London Conference in matters affecting "Forwarding" policy and practice. Certain information had been asked for, which the Committee of the Air Section were endeavouring to elicit from their own members through a circular questionaire.

(b). *American Section.*—In the absence of the Chairman, the Acting Secretary made brief reference to July/August meetings of the American Section, and particularly to a visit received from the Chairman of the Liverpool Association when matters of mutual interest between Liverpool and London had been discussed at large. The Section was still concerned over the difficult question of Through Bills of Lading, and some apprehension had recently been created by a suggestion that one of the Steamship Lines was making direct "through" quotations to inland destinations on a basis which could not possibly show any profit to the Company in respect of forwarding agency services proposed to be included.

(c). *German Section.*—The Chairman reported as to the recent proceedings of this Section with particular reference to a discussion on policy in relation to the new P.L.A. schedule of charges on inward Continental parcels. The Section had agreed that no collective action could usefully be taken until members had had an opportunity of testing the operation of the new schedule in actual practice. It appeared that in point of fact, the schedule did not give what *prima facie* it had appeared to give, *i.e.,* a fixed inclusive rate to cover Customs opening, since the rates set out in the schedule were subject to the qualification that if special circumstances called for extra opening, etc., extra charges might be imposed at discretion.

(d). *French Section.*—The Chairman made brief report re the French Section and arising out of a matter brought forward within this Section the Acting Secretary reported as to:

Deputation to the Railway Clearing House re Railway Rates Charged on Parcels for Export Delivered Intermediately to Agents' Warehouses in London.—The President, with Mr. Turvey, Mr. Stockwell, and Mr. Challis (for the Secretary), had attended the Railway Clearing House on August 30th, by appointment, to interview representatives of the Railway Managers as to the possibility of reinstating a concession which had obtained from 1911 to 1921, whereby parcels from inland centres en route to the Continent, and dispatched at export rail-rates, should be allowed to be delivered to forwarding agents premises in London for subsequent forwarding abroad, thus giving the agents an opportunity of "grouping" parcels destined for particular centres abroad. The Railway Managers stated that the earlier concession had been found to be abused by certain agents, and that the Railway Companies really had no safeguard which it was practicable to enforce against the mis-declaration of parcels when handed in at provincial depots, and which, though granted export rates on the Railway were, in fact, never sent abroad at all by the London agents to whose premises they were diverted. The matter had been discussed at large at the interview, and certain particulars had since been given by the Secretary to the Railway Clearing House. Further communication was now awaited from the Railway Managers.

Annual Dinner.—The Acting Secretary reported that the Dinner was definitely fixed to take place on Monday, November 25th. The tickets would cost 12s. 6d. each, and the

Digitized by Google

announcing circular to members would be sent out about the middle of October. The Dinner Committee had held some meetings to determine the principal speakers, and also the general list of guests to be invited by the Conference.

The gentlemen invited to be the principal guests, and to speak to the toasts were: Mr. G. M. Gillett, M.P., Parliamentary Secretary to the Department of Overseas Trade; Sir Geoffrey Clarke, Acting Chairman of the Council of the London Chamber of Commerce; and Sir Ernest Benn, Bart. The two last named had accepted the invitation, but a reply from Mr. Gillett was not yet to hand.

International Chamber of Commerce.—The President had received a letter from Mr. Robertson, signifying his wish to resign his appointment as representative of the Conference at meetings of the International Chamber of Commerce. The Council approved of the letter of regret and of thanks for past services, which the President had already addressed to Mr. Robertson on behalf of the Conference. With regard to the representation on the International Chamber of Commerce, it was proposed and unanimously agreed that the President should himself in future be the nominal representative of the Conference for this purpose, and that it should be left to his discretion, as need arose from time to time, to appoint some suitable member of the Conference to attend meetings as his substitute in cases where agenda items seemed to call for special knowledge of any particular kind.

Affiliation Arrangements with the British Association.—At the President's suggestion, proposals were submitted for affiliation between the London Conference and the British Association, and some discussion took place.

It was eventually decided that further consideration of the subject should be adjourned, and a special meeting of the Council should be called with the object of disposing of this question. The Secretary, in the meantime, to circularise an outline of the proposals to the members of the Council.

New Cuban Regulations.—A member of the Council raised a question as to the new "Shipping Instructions" issued by the Cuban Government. Mr. Duffett explained that these had now been considerably modified as a result of representations made by the London Chamber of Commerce and other bodies, and, in case these should not generally be known to members, it was agreed that the Secretary should circulate the latest information with the Minutes of the meeting.

White Cross Line.

The advent of a new steamship line is worthy of special note and is a happy omen for the future of our great shipping industry, showing that the spirit of adventure and enterprise for which this country has been so long pre-eminent has not departed from her. Newport, Mon., has a splendid record for progressiveness and has built up a great connection with all parts of the world through the docks and the ships which sail therefrom.

The White Cross Line has its headquarters at Trident House, Newport, and the managers are Pardoe-Thomas & Co., Ltd., and the fleet of new vessels will comprise fifteen, varying from 6,500 tons to 8,000 tons, of these four have already been delivered and the remainder are due at intervals up to December, 1931.

In a foreword to a brochure, the managers state that the line is independent—free, and its aim and policy is to work without the questionable "Deferred Rebate System."

An Interesting Demonstration Car.

With the idea of introducing their Coffee Extract to the public all over the country, Messrs. J. Lyons & Co., Ltd., have put into service an improved type of demonstration car.

The chassis is a 20-h.p. "Guy," having an overhead valve engine, and a dropped frame, and is especially suited to fast work. The specially built body has several interesting features. Two urns for boiling water and one for hot milk are fitted. The latter has an electric "Tell-Tale," which rings a bell when the milk reaches the correct temperature.

The water is carried in a tank above the driver's cabin, being connected to the water urns and the water jacket of the milk urn. It is heated by Primus burners. A special ventilation cowl in the roof carries off the steam.

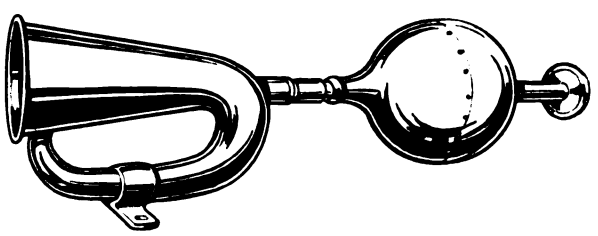
A 20-H.P. "GUY" IN THE SERVICE OF J. LYONS & CO., LTD., FOR DEMONSTRATION PURPOSES.

The cups and saucers are carried in breakage-preventing containers, and cupboards are provided for stock and other articles. There is a washing-up tank, with separate heating apparatus. A petrol engine drives a dynamo for supplying electric light, and storage batteries are also fitted.

Within a few minutes of arriving in a market-place, the car can be opened up and made ready for demonstration work. Free sample cups of coffee are handed to the by-standers, having been freshly made in the car.

"Lockgard" Bulb Horn.

What is claimed to be a practically indestructible Bulb Horn has been patented recently by Barrett Wakefield (1928), Ltd., Motor Accessory Manufacturers, Crown Works, Lozells Road, Birmingham. This horn has been designed especially to meet the needs of drivers of heavy vehicles. To overcome the tendency of bulbs to split at the neck the makers of the "Lockgard" Mechanical Bulb Horn have patented an adaption by which the bulb is completely enclosed in a metal shell which is so shaped that the bulb gets protection from distortion at every part, thus avoiding the sagging which is so commonly a cause of trouble. The bulb is kept in the dark thus preserving the rubber upon which light has a bad effect. The air is pumped through the reed by means of a mechanically operated plunger. This is claimed to have two advantages over the usual method of applying pressure by the fingers. In the first place, because of the contour of the shell, all the air in the bulb is driven through the bulb thus giving a far more resonant note than is usually obtained. In the second place it is far easier to operate the plunger than it is to continually squeeze a bulb. In fact it is possible to keep up a continuous note for a considerable time with very little effort on the part of the driver. The adaption can be very quickly fitted to any existing make of horn; a complete horn need not be purchased; all the manufacturers require to know is the type and make of horn to which it is desired to fit the adaption. The price of the horn complete is 25/- and for the adaption only 12/6. The manufacturers' London agent is Thomas P. Headland, Pearman Street, Westminster Bridge Road, London.



THE "LOCKGARD" MECHANICAL BULB HORN.

REUTERS TRADE SERVICE.—By special arrangement with Reuters Trade Service we are publishing news items from all parts of the world dealing with transport matters.

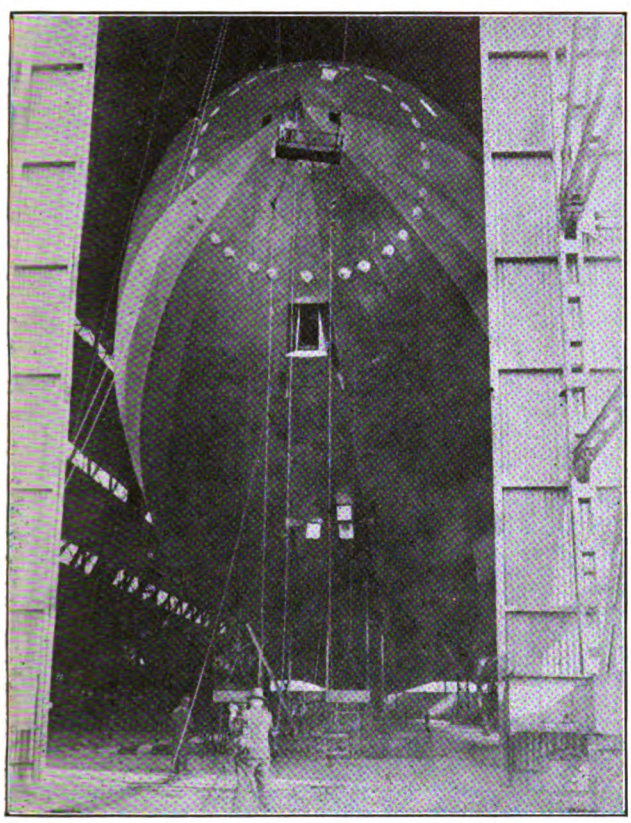
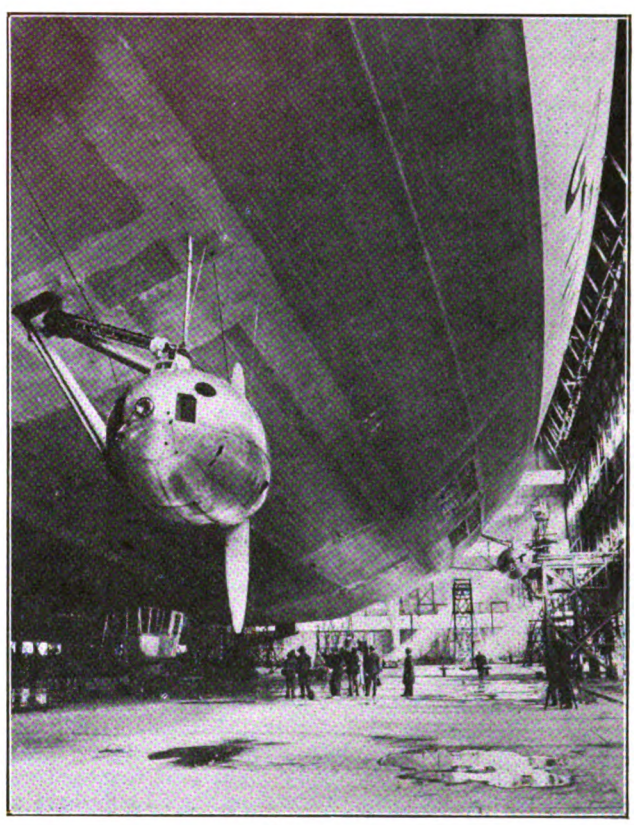
The Airship R101.

A Visit to Cardington.

The Airship R101, built at the Royal Airship Works, Cardington, near Bedford, by the Air Ministry, with her companion airship R100, constructed at Howden, Yorkshire, by the Airship Guarantee Co., are the largest airships yet built. Many rumours have been abroad as to these vessels, and doubts have been expressed as to whether they would ever be completed. They are now ready for their trials and we were privileged to inspect the R101 on Wednesday, October 2nd last. The decision to proceed with the construction of these gigantic airships was made in 1924, at which time the largest vessel built was little more than half the size of the new rigids. Many novel problems had to be solved as a result of the immense size and the desire to use heavy oil instead of petrol. Three years of experimental work was required to meet these new conditions and to carry out thorough tests before proceeding with the erection of the vessel. Entering the huge shed, one is struck at once by the beautiful lines of the gigantic airship, glistening in the sunshine. Proceeding to change our shoes for rubbers,



SHOWING THE NOSE OF THE R101 PEEPING OUT OF ITS SHED.



A CLOSE-UP VIEW OF THE R101 SHOWING ONE OF THE ENGINE GONDOLAS.

we were conducted in parties over the airship, inspecting the ample dining and sleeping accommodation, and admiring the spacious lounge, which is the width of the vessel, with observation windows each end. The electrical kitchen installation is complete in every respect, and the accommodation for the crew is arranged with special care for their comfort.

The gas capacity of R101 is approximately 5,000,000 cubic feet, giving a lift of something over 150 tons. Her length is about 732 feet, her maximum diameter about 132 feet, her height including control car about 140 feet. The length, diameter ratio is, it will be seen, 5½-1. The shape was adopted after exhaustive model tests at the National Physical Laboratory, which shewed it had good aerodynamic efficiency. Structural considerations have hitherto prevented the adoption of a really good shape, but in the design of R101, these limitations have been removed.

The passenger accommodation is located on two decks inside the ship in the bottom portion of bays 6-7 and 7-8. The upper deck has an area (exclusive of the promenades) of 5,550 square feet. The lower deck has an area of 1,730 square feet, which can be increased later, if found necessary, to approximately 4,000 square feet, by means of side wing decks.

The upper deck carries a large lounge with promenades on either side, from which the passengers may obtain an outward view through windows in the outer cover. This deck also carries a separate dining room for 50 persons, and a number of two-berth sleeping cabins. It also carries washing accommodation which consists of hand basins arranged in cubicles.

The lower deck carries the Captain's control room, and beneath this a control car projects outside the outer cover. There is open communication between the control room and the control car. There is a separate wireless cabin adjacent to the control room.

The kitchen with its electrical cooking arrangements, is located on the lower deck, and a small lift communicates between this and the dining room on the upper deck.

The lower deck also carries the electric distribution room and a ventilating chamber. From this chamber an electrically driven fan circulates the air in the passenger accommodation through a large radiator fed by steam from two of the airship's main engines, and induces a proportion of fresh air from outside. When the heat is not required, the radiator is lowered outside the hull to be cooled in the ordinary way.

A corridor runs along one of the bottom longitudinal girders, and this will be used for communication for passengers between the passenger accommodation and the point near the nose of the ship from which they will enter the ship at the mooring tower. This corridor is slightly larger than that provided in an ordinary train.

The machinery of the airship is carried in five independent power units, each arranged to be self-contained and easily replaced by spare units. Such an arrangement avoids undue delays due to breakdown in the machinery, as a complete power car can be removed for overhaul or repair, and another attached to the airship more quickly than an engine can be taken out of a car and replaced.

It was originally intended to fit variable pitch propellors to enable all the engines to be reversed. The development, however, of such an airscrew for the Tornado engine, is not yet complete, and consequently R101 will, in the first instance, take the air with four engines to go ahead, and one to go astern.

The effect of this arrangement in conjunction with the

Digitized by Google

fact that the horse-power of the engine is lower than that for which the R101 was designed, means that while the airship on her trials should attain a top speed of about 70 m.p.h. with a cruising speed of about 63 m.p.h., she will not attain her design (top) speed of about 80 m.p.h., until more forward power is available.

Each unit contains a Beardmore Diesel Engine of 585 h.p. driving an airscrew. There is also a small auxiliary engine by which the main engine is started through a Bendix gear. This auxiliary also drives an air compressor in two of the units, the compressor being required for the transfer of fuel in the ship. In the other three units an electric generator is fitted in place of the compressor, this generator can be driven by the auxiliary engine when the ship is not underway. When, however, the ship is proceeding at speeds in excess of 60 miles per hour, the generators are driven by variable pitch windmills which automatically keep the speed of rotation constant.

There are two important respects in which this engine unit differs from those of earlier airships:

(1). The fuel used is a heavy fuel oil of which the flash point is considerably higher even than the oil used as fuel in ships' boilers. The specification of this oil has required considerable care, because while a very high flash point has been achieved, it has been necessary to accept only oil which will not thicken at the low temperatures which will be experienced in flight. The oil actually used has a flash point of 210° F., and flows satisfactorily at temperatures down to 0° F.

(2). The engine is of the water-cooled type, but is arranged so that instead of circulating water through the radiator, steam only passes to a condensing radiator. This has the important advantage of enabling the radiator to be placed at any convenient distance from the car without involving the prohibitive weight which would result if the radiator and connecting pipes were filled with water. In those engine cars which are near the passenger space, arrangements have been made for delivering the steam to a radiator which will be used for heating the passenger accommodation. When this heating is not required, the steam radiator is lowered so as to project below the outer cover of the airship and be cooled by the passing air. When the passenger heating system is in operation, the cooling of these engines will be achieved without any increase of the resistance of the airship.

The Diesel type engine, in addition to the greatly increased safety which it gives through the use of heavy oil, has the advantage of increased reliability through the elimination of carburetters and magnetos. It is also economical both as regards the quantity and the price of the fuel it consumes. A given quantity of oil fuel gives about 25-30 per cent. greater range than does the same weight of petrol, whilst the oil fuel costs approximately £5 a ton as against £25 for a ton of petrol.

Until the airships have been put through their trials, no detailed figures can be given as to this—much depends, for example, on fuel consumption. As has been stated, however, in the House of Commons, the useful load of R101 has been to some extent sacrificed in order to embody certain experimental developments which were felt to be of great importance for the future, *e.g.*, the unbraced ring, and the heavy oil engines. Consequently cabins for 52 only have at present been fitted. Details of the lounge, smoking and dining accommodation are given elsewhere.

Tests and Trials.

A very complete series of tests have been carried out on the equipment of R101 during the course of construction.

These include tests of:—

(1). Fuel and water ballast containers, pipe lines, etc., including the transfer of fuel and water from one part of the ship to another. Rate of discharge of water ballast, etc.
(2). Electrical installation for lighting, power and cooking.
(3). Rudder and elevator controls for operation by power and by hand.
(4). Gas valves, for automatic and hand operation.
(5). Wireless installation.
(6). Engine units, including running of each power car when in position on the airship. This is in addition to extensive tests on the special gantry and engine acceptance tests at the makers' works.
(7). The mooring and handling equipment including mooring force indicators in the bow.
(8). Fin loading.

When the airship is air-borne, that is when all erection, staging, and suspensions, etc., have been taken away, and the ship is maintained in equilibrium by the lift of the gas, lift and trim trials are carried out to ascertain the actual lift of the airship and to check the correct distribution of all fixed and movable weights about the centre of buoyancy.

The trials of the two airships will, it is anticipated, occupy 3-6 months at home, and will be carried out from the R.A.W., Cardington. These flights will be of a progressive nature, and will ultimately be extended to the bases abroad. The shed trials of R101 have been carried out, and those of R100 are nearing completion. The home flight trials of the two airships will follow each other.

The Airship Directorate.

Squadron Leader R. A. B. Colmore, Deputy Director of Airship Development, is in charge of the Airship Directorate under Air Marshal Sir John Higgins, Air Member of Council for Supply and Research.

The Directorate is divided into five divisions.

Lieutenant Colonel V. C. Richmond, the chief designer of R101, is in charge of research and design. His chief assistant on the research side is Squadron Leader F. M. Rope, and Wing Commander T. R. Cave-Browne-Cave with Mr. Fitzgerald, on the engine side.

Major G. H. Scott, C.B.E., A.F.C., the officer in charge airship flying.

The works manager is Mr. R. S. Hubbard.

Flight Lieutenant S. Nixon has been responsible for the ground organisation at home and abroad.

The Secretary and Accountant is Mr. D. J. Evans.

The Ships' Officers.

Major G. H. Scott, C.B.E., A.F.C., the officer in charge of airship flying, will be responsible for the flight trials of both airships. Squadron Leader E. L. Johnson, A.F.C., R.A.F.O., will be navigating officer on each ship during flying tests.

Each airship will have a crew of 50 officers and men.

Flight Lieutenant H. C. Irwin will be Captain of R101, and with him will be Lieutenant Commander N. G. Atherstone as 1st Officer, and Flying Officer M. H. Steff as 2nd Officer.

Squadron Leader R. S. Booth is to be Captain of R100, and Captain G. F. Meager 1st Officer.

A crew is normally divided into three watches, of which two watches are already engaged and trained for each airship. The third watch, which will be drawn in each case from men employed on the construction of the ships, will be transferred to the operational side when flight trials begin.

Amalgamated Horse and Motor Owners' Association.

Several matters of importance were dealt with at the meeting of the General Council of the Amalgamated Horse and Motor Owners' Association, Ltd., Manchester, held last month at the office of the Association in Corn Exchange Buildings, Manchester. Mr. J. Walker presided, and there were also present:—Messrs. J. Clegg, T. Raynor, W. Gee, S. Berry, W. Mitchell, G. W. Leggott, S. Kay, J. G. Thompson, W. Farnorth, Councillor J. Eastham, and Mr. J. S. Howarth (Secretary).

The secretary read further correspondence which had passed between the Amalgamated Horse and Motor Owners' Association and the Master Farriers' Association on the subject of shoeing charges and reported that a conference between representatives of the Association in the districts affected, and representatives of the Master Farriers' Association has been held at Bolton, when the whole question of the charges for horse shoeing in Bolton, Bury, Radcliffe, Heywood and districts, was discussed. It was decided that the two districts of the Master Farriers' Association should be requested to meet together to discuss the whole position again, to see if they could not agree to reduce the charges equivalent to the other districts.

A member stated that a Leeds firm had sent a sample of a steel shoe, with a rubber bar attached, to the Bury Corporation, submitting that this shoe can be fitted and that it would last three times the length of the ordinary shoe.

It was suggested that the secretary should write the firm in question asking for a sample shoe and full particulars, so that the Committee could consider same.

The Secretary reported that the Commercial Motor Users' Association had been considering the problem of weak and restricted bridges, and had taken this matter up with the Minister of Transport. The Birmingham Association had also been acting on parallel lines and had requested the Minister of Transport to deal with inadequate bridges as soon as possible.

Railway Notes and News.

L.N.E.R. Appointments.—We are officially informed by the London and North Eastern Railway Company that the following appointments have been made:—Mr. G. Mills, Assistant to Chief General Manager (Rates and Statistics), to be Assistant to Goods Manager, Southern Scottish Area, in succession to the late Mr. W. Calder. Mr. H. S. Cole, late Company's representative in Australia, to be Dock Superintendent, Western Docks, Hull, in succession to Mr. W. H. Waugh.

Sir Henry Thornton's New Appointment. Director of the Royal Bank of Canada. — Sir Henry Thornton, K.B.E., President of the Canadian National Railways, and at one time General Manager of the Great Eastern Railway of England, has been appointed a director of The Royal Bank of Canada. Since going to Canada in 1922, to take charge of the Dominion's State-owned railway system, Sir Henry Thornton has become one of the outstanding figures of Canada's national life, and he has effected, as President of the Canadian National Railways, one of the most remarkable railway re-organisations in modern times. Under his presidency the Canadian National Railways' net earnings have risen in 7 years from less than 3 million dollars to nearly 58 million dollars, and he has been responsible in the past two years for the introduction of new types of motive power and rolling stock which are revolutionising railway practice throughout the world.

Irish Free State Railway Tribunal.—The three members constituting the Irish Free State Railway Tribunal, Judge D. J. O'Brien, K.C., chairman; Mr. H. Mangan and Mr. J. E. Kerr, have been appointed for another year. Their term of five years in office was about to expire, but the Tribunal has yet a good deal of practical work to accomplish, and it appears that another year will be required before the many matters in reference to freights are settled, and so the Tribunal, which is now considering the question of the fixing of standard charges, is continuing in office for the ensuing year and constituted in the same manner as since it was first set up in 1924.

Railway Appointment in Ireland.—It has been announced that Mr. J. M. Irwin, the Irish Traffic Manager of the London, Midland and Scottish Railway Company, will succeed the Right Hon. H. G. Burgess as Director on the Great Southern Railways Company, as representing in that capacity the L.M. & S. Railway Company. Mr. Burgess is retiring from that position, which he has held for some years past, and Mr. Irwin, who was recently promoted in the service of the L.M. & S. Railway Company, is to be his successor on the Directorate of the Great Southern Railways Company.

Engineers' Clever Feat.—A remarkable task was carried out recently by the Northern District Engineers' Department, L.N.E.R., who removed, in its entirety, a huge building at Low Fell, 220 ft. long by 27 wide, with a slate and glass roof and many windows. The structure was moved 100 yards north, and then sideways to a new foundation; and so carefully was this done that not a single slate or pane of glass was broken! The work was under the direction of Mr. F. E. Harrison (district engineer), Mr. F. Colbrook (assistant engineer) and Mr. T. Henderson.

Railway Statistics.—The railway statistics for June, 1929, have been published by the Minister of Transport and can be obtained at His Majesty's Stationery Office (Price 3/6).

Housing the Staff.—During recent years the G.W.R. have perhaps done more to assist its employees in the housing difficulty than any other industrial employer. Two schemes have been arranged, one to enable the individual members of the staff to obtain their own houses, and the other under which the Company purchased land, formed roads and sewers, granted a lease to a Public Utility Society formed by the staff and assisted financially in the cost of the erection of the houses which the Society lets to its members. Since 1922 some 4,000 houses have been erected under these schemes, involving nearly £2,000,000.

New Zealand Railways. Deficit in Operations.—The statement with regard to the financial position of the New Zealand Railways was presented to the House of Representatives on October 2nd. It shows a deficit on the year's operations amounting to £432,743, as compared with £291,452 last year. The increased deficit is attributed to the unprofitable new lines taken over during the year. The revenue from passenger traffic again showed a small decrease, but freights showed an increase of nearly four per cent.

Air Transport Notes.

Handley Page Bulletin. — The September number of "Handley Page Bulletin," published by Handley Page, Ltd., Cricklewood, London, contains some excellent illustrations. The following is extracted from an article headed "A Visit to Cricklewood." "The many visitors who came to England in the hopes of seeing the Schneider Trophy seaplane race, and who are still here, should make a special point of visiting the Handley Page works at Cricklewood. They will there find much to interest them both in the form of new aircraft and of the latest experimental work which is being carried out on the slot and the slot and interceptor. New Handley Page aircraft include the Hare, one of the most interesting day bombers produced in the last ten years, the Guggenheim machine, which is a special study in super-safety, the giant passenger-carrying machine which is being built for Imperial Airways, Ltd., and which will carry 40 people in two large saloons, and the various heavy bombing aircraft, such as the Hinaidi, which have achieved a pre-eminent position among such types. They will also be able to examine for themselves the new interceptor device, which gives a lateral control at all speeds more powerful than has hitherto been thought possible, and the interconnected automatic slot and wing flap, which gives an exceptionally wide speed range combined with the special safety qualities associated with the ordinary automatic slot. . . . Visitors to England are cordially invited to make a tour of the Cricklewood works before they return to their home countries."

"The Book of the Moth" and the "D. H. Gazette."—We have received copies of "The Book of the Moth" and "The D. H. Gazette." The former, besides embodying a specification of the prototype of light aircraft, represents a sincere attempt to foster the spirit of the air by discussion of the questions to which every potential owner of a private aeroplane naturally seeks an answer. It is published in English, French, German and Spanish. "The D. H. Gazette" was started three years ago as the "house organ" of The de Haviland Aircraft Company, of Stag Lane Aerodrome, Edgware, Middlesex, and now has a world-wide mailed circulation of some 6,000 copies.

East African Air Service.—National Flying Services, Limited, have been considering the extension of their activities to areas outside the British Isles. It will be remembered that prior to the formation of the company, the Chairman, Captain the Rt. Hon. F. E. Guest, foreshadowed the possibility that this organisation might ultimately provide feeders or branch lines to the main Imperial Air Routes. This possibility has now been given concrete hope by the decision to open an aeroplane service covering certain districts in East Africa. It is proposed to open an office at Nairobi, capital of Kenya Colony, and to inaugurate an air taxi service between the various centres of population. As soon as the main Cape to Cairo air route is in service, this local organisation will be in a position to take passengers from outlying centres to the main stations on the Trans-African route, and it is hoped by this means considerably to popularise the trunk service to be inaugurated by Imperial Airways, Limited, and their collaborators. National Flying Services, Limited, have satisfied themselves that there is a very great potential demand for the facilities which they will be able to afford, for example, the use of their machines will bring Government servants or settlers, either on leave, duty or business, many days nearer to England. No person will be obstructed by the fact that during a long period every year the roads are generally impassable. With regard to internal lines, the linking up of such outlying communities as the soldier settlements, at present over 200 miles from Nairobi, with the main centres of population should greatly increase the amenities of the country.

Dutch Winter Air Services.—The Royal Dutch Air Lines announce that the winter service, which began on October 7th, will embrace a daily return service with London (Croydon) and a daily return service with Paris and Brussels, but there will be no service on Sundays. The winter service of the German Luft Hansa will not begin until November 1st. Until that date all parts of North, Central and South Germany will be served daily by air.

Holland—East Indies Air Mail.—A regular fortnightly air mail service between Holland and the Dutch East Indies was inaugurated last month when a triple-engined Fokker plane, piloted by M. Smirnoff, left for Budapest, the first stopping place on its long journey.

News from the Ports.

Merseyside Area.

Liverpool Shipping and Forwarding Agents' Association.—At the September meeting of the Council of the Liverpool Shipping and Forwarding Agents' Association, a number of matters of importance were raised, but none of these can be publicly commented upon at the present stage. Another meeting was held in the early part of this month and the annual general meeting of the Association is due to take place next month.

The Technique of Shipping and Forwarding.—Mr. S. L. Jude, of Messrs. R. W. Stewart and Co., and the secretary of the Liverpool Shipping and Forwarding Agents' Association, will, during the winter months, take a series of classes at the City of Liverpool School of Commerce. Special courses on subjects primarily of interest to those connected with the shipping industry have been arranged in consultation with the Liverpool Shipping and Forwarding Agents' Association (Inc.), the Liverpool Steamship Owners' Association, the Liverpool District Association of Chartered Shipowners and the Liverpool Shipping Staffs' Association. Mr. Jude will tutor the second year students and will deal particularly with the duties of shipping and forwarding agents. The scope of his lectures will embrace:—Definition; Historical survey; main two divisions—inward and outward freight; Outward Freight. Piece and other manufactured goods. Operating the outward consignment. (a) At works and en route to Liverpool; (b) at Liverpool (including Shipping Agents' office routine). Inward Freight. Cotton wool, seeds and general produce. Operating the inward consignment from ship to destination. Land and water transport as it affects the shipper. Shipping documents and terms—their uses and meanings. River Mersey and growth of Port of Liverpool; the natural gateway to the West; the industries of Lancashire, Midlands, Yorkshire and Potteries, and their influence on the Port of Liverpool. The Passenger Agent; his service to the shipowner and traveller. Tourist traffic. Emigrant traffic. Office routine.

Medal for Traffic Official.—The paper "The Labourage Policies of Port Authorities," which was read before the Institute of Transport some time ago, has earned for its author, Mr. J. F. R. Wiggins, of the Traffic Department of the Mersey Docks and Harbour Board, The Institute of Transport Water Transport Gold Medal, donors, The Dock and Harbour Authorities' Association.

Certificates of Origin.—The Council of the Liverpool Shipping and Forwarding Agents' Association has been advised that certificates of origin issued in connection with shipments to Turkey must state weights (gross and net) in kilogrammes. Many shippers give these particulars only in English weights, and the custom authorities in Turkey take exception to this. In future certificates of origin on which the weights in kilogrammes are not stated, will be returned to the senders to be completed. Another point which has been engaging attention is that the "primage duty" of one per cent. ad valorem charged on goods entering New Zealand has been increased to two per cent., which is payable on all goods other than a few specially exempted articles imported into New Zealand. Shipping and forwarding agents who may desire any further information on the above matters should place themselves in communication with the secretary of the Association, Mr. S. L. Jude.

Consular Note.—Mr. Johan Vogt, Jun., has been appointed Vice-Consul for Norway in Liverpool. His father, Mr. Johan Vogt, is Consul for Norway, a post which he has held for many years. Mr. Vogt is associated with the well-known firm of shipbrokers, Messrs. Vogt and Maguire, of Liverpool, Manchester, Preston, etc.

Manchester Area.

Ship Canal Traffic.—We have received from the Manchester Ship Canal Company the monthly approximate traffic returns for August. This shows receipts for the month of £115,359, against £112,091 in August last year, an increase of £3,268. In only one month so far this year have the traffic receipts fallen below those for the corresponding month of last year—though in all but one instance they have fallen below those for the corresponding month of 1927—and the total for the first eight months of this year is £973,701, against £953,876 for the corresponding period of 1928, showing an increase of £19,825.

Progress of the Port.—Manchester continues to maintain its high place in the list of British seaports notwithstanding the handicaps of trade dislocation and short time working. The cotton season ended with an increase on last year's imports. The total number of bales received up to the end of July was 679,352, as against 558,823 for the previous season. This satisfactory result is partly accounted for by the reduction of the Ship Canal Company's toll. Of the Egyptian cotton imported during the last season and retained for manufacture in the United Kingdom, Manchester received 186,000 bales and Liverpool 177,000 bales. The enterprise of the Ship Canal Company in developing Ellesmere Port and giving it facilities for dealing with all kinds of traffic has been quickly rewarded by the introduction of a big industrial undertaking in that district.

Tyne and Tees Area.

Tyne Crossing Schemes.—No further stage of importance has been reached in the vexed Tyne crossing question, by tunnel or bridge, but business circles in both North and South Shields is unanimous that an adequate transport crossing is vital to the future prosperity of the two harbour towns, especially in these days of ever-increasing motor traffic. Meanwhile, the steam ferry boats maintain a frequent service.

No Idle Shipping.—When the Tyne Improvement Commission met in September it was stated there was no effective tonnage laid-up in the river, and that coal and coke exports were suffering from lack of tonnage. At the close of the North-East Coast Exhibition, the Commission's fine model of the Tyne will be sent to the International Exhibition, which is to be held at Antwerp. Continued improvement in trade on the Tyne was reported. River dues for July and August showed an increase of £11,000 over the corresponding months last year.

Coaling Charges on Tyne.—At a luncheon given by Tynemouth Corporation to the directors of the British Trawlers' Federation, Sir John Marsden, of Grimsby, stated that the charges made on the Tyne for vessels coming in to coal compared unfavourably with those of other ports. In reply, Mr. H. J. Moscrip, assistant general manager of the Tyne Improvement Commission, stated that the Tyne charges were little higher than those at Blyth, and that the conditions were altogether better.

New Wearmouth Bridge.—This imposing structure at Sunderland has been completed well ahead of the scheduled time by Sir Wm. Arrol & Co., Ltd., of Glasgow. Workmen are now busy demolishing the stone columns which supported the old bridge.

New Bridge for Tees.—The Ministry of Transport has agreed to bear 75 per cent. of the cost of a new £600,000 scheme to throw a bridge across the River Tees at Newport. The work, however, could not be begun earlier than the summer or even autumn of 1930. It should provide welcome work for Middlesbrough and district.

New Graving Dock.—The new graving dock of Smith's Dock Co., Ltd., at North Shields, is now open. It replaces the old No. 5 dock. More than 130,000 tons of earth have been excavated and dumped at sea, and 60,000 tons of concrete were used in building the walls and floor. The new platers' shed is one of the finest and best equipped of its kind in the world. Mono-rail cranes travel through it. The dock is 480 ft. long and 68 ft. broad at its entrance.

Blyth Coal Export Record.—At the September meeting of the Blyth Harbour Commission, the figures submitted as to coal export showed an increase of 17 per cent. on 1913 and 23 per cent. on 1928. A further reduction in harbour dues has been made, so as to keep Blyth in the forefront as the cheapest port on the North-East Coast.

Jarrow Slake's Future.—Keen interest is being manifested in the proposed development of Jarrow Slake under the Government's scheme for alleviating unemployment in industrial areas. While it is unlikely that the Slake will ever be converted into a dock, as had been suggested, staiths may be erected along the river front for the loading of coal and coke and unloading of cargoes such as iron ore.

Quay Extension.—The Tyne Improvement Commission is extending its riverside quay and transit shed at the Albert Edward Dock, a fact which speaks eloquently of good business, both present and prospective.

Clyde and Forth Area.

De-Rating Benefits. — An amount of approximately £81,000 relief from local rates due to de-rating will be apportioned to users of the Clyde Navigation Trust undertakings. Shipbuilding is not, however, to receive any rebate. At a meeting of a special committee Sir William Raeburn, Bt., said that when they came to consider the whole question of apportioning the relief shipbuilders might be wondering why they had not been included. When they came to deal with the figures they would realise that the relief would be a mere bagatelle to the biggest shipyard on the Clyde, and just a drop in the bucket to the smallest. It was far better to grant the relief to the trades which could very well do with it. The recommendations which were approved include a 30 per cent. rebate from the revenue derived from coal, coke, gas, iron, ore, etc. A 30 per cent. rebate is also recommended from the revenue derived from all coastwise goods, inwards and outwards, and 15 per cent. from the revenue derived from the rates on the gross registered tonnage using the graving docks.

Overtime at Docks.—Negotiations are still proceeding between the Transport and General Workers' Union and the East of Scotland coal exporters regarding Saturday overtime. The ports affected are Leith, Grangemouth, Bo'ness, Burntisland, Methil, and Granton. The exporters claim that a number of vessels are delayed over the week end. They propose that the men should work overtime on Saturdays for which they would be paid one third more than the tariff rates. The men refuse to work and the position will be reported to the National Docks Committee of the Union.

Bo'ness Dock Extension.—Some further progress has been made with the proposed extension of the dock and duplication of the railway line from Manuel Junction to the terminus. Mr. E. Shinwell, M.P., the Financial Secretary to the War Office, attended a conference at Bo'ness and said the Ministry of Transport had been in communication with the London and North Eastern Railway Company as the local harbour authority and had been informed by the chief general manager that the proposal for the extension of the dock accommodation was at present receiving the very careful consideration of the Company under the latest Government Development Act. The railway company are in sympathy with the proposal and the question was one largely of finance.

South Wales Area.

De-rating and Coal.—According to a statement at Swansea Chamber of Commerce by Mr. Chubb Jones, president, the effect of de-rating on coal will be, as regards dock charges, a rebate on halfpenny per ton on coal shipped in ordinary wagons and three-farthings per ton on coal shipped in 20 tons wagons. The ordinary wagon is, of course, ten tons capacity.

Railway Rebates.—Mr. Poole (Coast Lines, Ltd.), at a recent Swansea meeting, raised the point of why railway companies should give a rebate of 4d. per ton on tinplates for foreign export and only 7½ per cent. on wharfage rates, which works out at approximately ½d. per ton, on tinplates shipped coastwise? He contended that the bulk of tinplate shipped coastwise from South Wales went to other ports for export, and contended the present arrangement unfair to coast trade which had fostered tinplates trade. Mr. Chubb Jones said it ought to be borne in mind that the railway companies in dealing with such charges looked upon coastwise service as direct competition with railways and, possibly, their answer was that competitors could hardly expect fullest rebates. On the question of whether coastwise tinplate pays a double charge, however, a traders' committee will examine the matter.

Severn Bridge, Beachley-Aust, Vetoed.—The Great Western Railway Company has now replied to the local authorities who urged upon the company the desirability of erecting a combined road-rail bridge over the lower Severn from Beachley to Aust, that the cost of such a scheme is prohibitive having regard to all factors. It has been pointed out that such a bridge might be detrimental to Severn navigation and commerce and might interfere with the Severn barrage scheme.

Shipbrokers' Officials.—The Bristol Channel District of the Chartered Shipbrokers' Association has elected Mr. John Williams, Swansea, to be chairman of the branch Association for the ensuing year, and Mr. Edgar James, Cardiff, to be vice-chairman. Mr. Williams is manager of Messrs. Richards, Turpin, Shipping (Ltd.), Swansea, a position he has held fifteen years. Mr. James is a native of St. Mellon's.

Humber Area.

Dock Improvements.—Goole is delighted to know that the London, Midland and Scottish Railway has earmarked over £100,000 of the money accruing to it from the abolition of the passenger tax to improvements there, and Hull and Grimsby are anxiously awaiting the announcement of the London and North Eastern Railway Company of their allocation of the same fund. Both ports have many things they want the railway company to do for them.

Humber Shipping.—This continues to show some improvement, the increase in the arrivals in dock being very acceptable. Coal exporters are growing busier, and future prospects are bright.

Pilotage Rates.—The Humber pilots, in an appeal to the Board of Trade, have got the better of the shipowners. A few years ago the shipowners succeeded in inducing the Board of Trade to make a reduction of 50 per cent. in the pilotage rates payable by vessels entering or leaving the port in ballast. This spring the pilots asked for this reduction to be withdrawn and for a general increase of pilotage rates. The shipowners countered with a request for a general reduction. After an enquiry by one of its inspectors, the Board of Trade has altered the reduction to 30 per cent., and added that at the end of a year they will be prepared, if the pilots so desire it, to consider the introduction of normal rates for vessels in ballast. As to the other rival applications they make no order, but they say that in the event of the ballast rate being abolished at the end of a year they feel that some compensating adjustment might be found necessary, not only in the general level of rates but also in the present distribution of the pilotage burden as between the different classes of shipping. No body of men are more jealous of their rights than the Humber pilots, and their readiness to fight for them under any and every condition has resulted in establishing them in a very strong position.

Irish Ports.

Port of Waterford Improvements.—In the interests of export and import trade at Waterford, some very desirable improvements are being carried out by the Waterford Harbour Board. A deep water jetty, under construction for some months past, is now almost completed, and the grain berth is being deepened. The bed of the river in the vicinity of the port is to be improved so that vessels of 8,000 tons and upwards will be able to berth at all stages of the tide. The Harbour Board are leaving nothing undone to provide facilities for the loading and discharging of cargoes at the port, which is one of the most progressive in the Irish Free State.

Motor Vessels for Belfast-Liverpool Service.—During September the "Ulster Queen," the second of the three motor passenger and cargo vessels built at Belfast by Messrs. Harland and Wolff, Ltd., for the Belfast-Liverpool service of the Belfast Steamship Co., underwent preliminary trials. A sister ship, the "Ulster Monarch," which was the first of the three vessels launched and completed, is now in commission, plying regularly between Belfast and Liverpool, and will have the "Ulster Queen" along with her on the route in future. The third motor vessel, the "Ulster Prince," is still in the hands of the builders.

Dues Collected at the Port of Cork.—At a meeting of the Cork Harbour Board, a report submitted by the Collector of Dues showed that the dues collected from 1st August to 14th September last totalled £11,210 5s. 11d., as compared with £10,720 16s. in the corresponding period of 1928—an increase of £489 9s. 11d.

Clyde Shipping Company's Offices in Waterford.—Mr. William Cuthbert, chairman of the Clyde Shipping Company, accompanied by his son, paid a visit to Waterford recently, and, in company with Mr. J. A. Watt, agent at Waterford for the Clyde Shipping Co., they inspected the offices and business premises of the Company, and the berthage for the Company's steamers at Waterford, with which they expressed themselves well pleased.

Transport Increasing at the Port of Belfast.—The Belfast Harbour Master's report, furnished to the Harbour Commissioners, showed that the total tonnage of vessels which had arrived at the port of Belfast from the 1st January to 14th September, 1929, was:—Coastwise or cross-channel, 1,810,028, an increase of 150,876 tons over the corresponding period of 1928; foreign, 441,964, an increase of 10,232 tons; and non-trading, 51,775, an increase of 869 tons. These in the aggregate amount to a tonnage of 2,303,767, which is an increase of 191,977 over the corresponding 37 weeks of 1928.

News from all Parts.

Port of Bristol Authority.—The annual report of Mr. Thomas A. Peace, the General Manager of the Port of Bristol Authority, upon the working of the Docks Estate, together with the statement of accounts for the financial year ended 31st March last, contains interesting information. The Report states that during the financial year 1928-9 the depression in trade throughout the county continued, and in the circumstances it is satisfactory to report that notwithstanding the difficult conditions, the Port generally maintained its relative position in the import and export trades. The total expenditure on works, including the extension of the Royal Edward Dock, approved as schemes partly for the relief of unemployment from 1920 to 31st March, 1929, was £1,148,099. The tonnage of vessels resorting to the Port has been steadily maintained throughout the year. The total net register tonnage of vessels from foreign ports was 2,144,522, compared with 2,119,592 in 1928, and is only slightly below the figures for 1925, which was a record year for the Port.

Quick Work at Hartlepool.—The L.N.E.R. report that the s.s. "Corbea Mendi" secured an exceptionally quick despatch at Hartlepool recently. The steamer arrived on Sunday, September 1st, commenced loading 5,951 tons of cargo coal and 810 tons of bunkers on Monday morning, and sailed for Spezzia at 5 o'clock on the morning of Thursday, 5th September.

Danish Car Owners to Run Own Ferry Across the Great Belt.—The United Danish Automobile Owners have formed a company, under the name of The Motor-Owners' Ferry Transport, for the transport of motor cars across the Great Belt, the strait between the Islands of Zealand and Funen and Jutland. The new ferry boat will be 200 feet long, 36 feet broad, depth, without load, 9 feet 6 inches. It is calculated to take 40 to 50 cars at a time, and the cars will be driven straight on to the ferry. Should there be any difficulty about harbour accommodation the ferry will be fitted with electrical turning tables, so that loading and unloading can take place over the sides. A double trip can be completed in three hours, and the rates will be much lower than on the state railways. While these hitherto have shown little interest, says "The Monitor," in an improved transport for motor cars across the Great Belt, they have now reacted to the extent of starting a special motor car ferry between Kalundborg, in Zealand, and Aarhus, on the mainland across the Samso Belt.

White Star Line at the Shipping Exhibition.—At the Shipping, Engineering and Machinery Exhibition, held at Olympia recently, the White Star Line displayed an attractive selection of oil paintings by W. L. Wyllie, R.A., and other famous marine artists, portraying vessels from the earliest days of the Line to those of to-day. Particularly interesting comparisons were the 3,807 tons "Oceanic" of 1871, with the present giant 56,621 tons "Majestic," the largest steamer in the world; and the 5,000 tons "Britannic" of 1874 with the new 27,000 ship of the same name, the largest British motor vessel, launched at Belfast a few weeks ago.

London's Strangest Waterway.—Although London is honeycombed with subterranean passages none of these is more remarkable than the Islington Tunnel, which belongs to the Grand Union Canal Company. It is 960 yards long, and extends from City Road, Islington, to Muriel Street, Caledonian Road, far beneath main roads congested with traffic, and streets teeming with shops, houses and humanity. Through the tunnel daily passes an almost constant procession of barges laden with valuable cargoes of coal, timber and other merchandise, much of which comes from overseas, and it is a vital link in the chain of commerce connecting the Port of London with important industrial undertakings in many parts of the Metropolis. There are certain areas indeed which cannot be reached in any other way than by barges carrying cargoes. Formerly these barges were propelled through the blackness of the tunnel by man-power, the men who performed this feat being known as "leggers." This method of navigation, however, was long ago superseded by the introduction of a steam tug, whose capacity for towing has never yet been seriously strained. Eleven heavily laden barges do not cause the tug any inconvenience, while she simply races away with twenty-five empty boats in her wake. The tunnel is almost as well known to the horses which tow the barges in the open as to the bargees themselves. And it is amusing to see them turn round just beyond the lock, aware that their burden is here to be transferred to the steel cable by which the barges are attached to the tug.

Future of British Canals.—Sir Oswald Mosley, who is one of the Ministers assisting Mr. J. H. Thomas in his efforts to deal with unemployment, has stated that he is examining the possibilities which an enlargement or improvement of inland waterway systems might offer as an outlet for surplus labour in this country. In this connection, the impression is certainly abroad among the executives of leading canal companies that their systems are on the eve of big developments. Already the waterways from London to Birmingham and Leicester are under the control of a single organisation, the Grand Union Canal Company, formed last year. This amalgamation marked the beginning of an entirely new phase in Britain's inland water transport system, for 240 miles of canals were brought under single control. Nottingham Corporation have improved the Trent approach to Nottingham, particularly between Nottingham and Newark, by rebuilding all locks on the section to 190 feet length and 30 feet width so that three 120-ton barges may now pass at one locking. Other improvements now being discussed are on stretches of canals from the Midlands to the Mersey, and the Midlands to the Severn—from Wolverhampton to Stourport and from Birmingham to Droitwich, joining the Severn at Hawford. The volume of traffic on the English canals has substantially increased in recent years. In 1927, for example, 732,937 tons of cargo were carried on the Regent's Canal, as compared with 593,556 tons in 1923. A motor boat service recently introduced between the Regent's Canal Docks and the Continent enables manufacturers to send goods direct to Rouen and Paris—by canal, sea and river.

America Comes East for Christmas.—For the convenience of the many Americans and Canadians who come to Europe for Christmas and the New Year, the White Star Line has arranged a number of personally conducted holiday excursions from New York. The first of these will travel by the "Olympic" from New York on November 23rd next, for Cherbourg and Southampton. On November 30th the "Homeric" will leave New York for the same ports, and on the same day the "Doric" will leave for Queenstown and Liverpool, each bringing a further party of holiday makers. The "Cedric," from New York on December 7th and from Boston the next day, the "Baltic" from New York on December 14th and the "Olympic" from New York on December 20th will also bring parties. Each party will be conducted by an expert representative of the White Star Line with a special knowledge of the ground to be covered. The tours will include the British Isles, and the greater part of Europe, one having been arranged to include visits to Greece, Jugo-Slavia, Bulgaria, Czechoslovakia, Roumania, etc. Others will concentrate on the British Isles, with shorter continental excursions than that above mentioned.

Dock Charges Reduced.—The L.N.E.R. announce that the charge for the shipment of coke at the ports of Grimsby and Immingham has been reduced from 7d. to 6d. per ton.

Southampton Docks.—Shipping traffic at the docks during the past few months has been exceptionally heavy. The quantity of freight handled continues to advance, the increase being particularly marked in regard to exports, which have shown a consistent and substantial growth since 1921. Principally due to the restrictions caused by the small pox scare, Cross-Channel passenger traffic during the early months of this year was not very favourable, but the holiday months of July, August and September have proved record-breaking as far as this traffic is concerned and should assure splendid returns at the end of the year. The advent of much new liner tonnage to the fleets of the great German shipping companies, notably the Hamburg-America Line and the Norddeutscher Lloyd, has enabled those companies to participate very fully in the increased trans-Atlantic passenger trade this year. During the westbound season, which reached its "peak" in September, practically every ship sailed with a full complement of passengers, the largest number on one vessel being carried by the White Star liner "Majestic" with a total of 2,490, comprising 770 first, 680 second, 490 tourist, and 550 third class. No diminution is apparent in the popularity of the pleasure cruise, and following the completion of a successful summer programme, comprehensive winter tours have been planned by the shipping companies interested in this class of travel.

Institute of Transport.

Metropolitan Graduate and Student Society.

Sir Josiah C. Stamp on taking a wide view of transport.

The 1929-30 session of the Metropolitan Graduate and Student Society of the Institute of Transport, opened auspiciously on October 1st last, at the Institution of Electrical Engineers, London, when **Sir Josiah C. Stamp, G.B.E.,** President of the Institute, and Chairman and President of the executive, London Midland and Scottish Railway, who was accompanied by Air Vice-Marshal Sir W. Sefton Brancker, K.C.B. A.F.C., immediate Past-President, addressed a large gathering of members.

Mr. A. W. Coombs, Chairman of the Society, presided.

Sir Josiah Stamp stressed the importance of the study of transport as a whole.

He said that the young men of to-day had tremendous advantages over the young men of yesterday in their professional and business life. When he considered what was the opportunity for mental improvement and the encouragement towards it that existed thirty or forty years ago, and contrasted it with the numerous institutions that existed to-day, he was struck by the really new outlook and surge towards better things individually and collectively that there was promise of to-day.

The Metropolitan Graduate and Student Society was a young society. In fact the Institute of Transport itself was young, and nobody quite knew what would be its ultimate purpose in the scheme of things, and the contribution it would make to economic society, but it was encouraging, and it was something he frequently indulged in himself, to turn to the early days of institutions and societies which to-day were regarded as practically a fixed part of the landscape; to look at the records of their early proceedings and early struggles, and to glean some idea of their hopes and destiny in order to see the ideals which animated them and to contrast them with what had been accomplished. If they turned to other societies such as the chartered accountants, or the incorporated accountants and their various affiliated student bodies, the members of the Metropolitan Graduate and Student Society would realise that they themselves were probably building to-day better than they knew, and that the immediate ideals and horizons of the present were not those to which they would ultimately attain, and it would be some source of pride to them, in perhaps thirty years' time, to look back and realise that they had played some part in shaping something that would fill a very important place in the world.

Transport Must be Looked at as a Whole.

To-day, transport, for the first time, was being looked upon as a whole. People were demanding that it should be, because they saw nothing but chaos and waste of capital and human energy if it was not looked at as a whole; but to what body of instructed opinion, to what class of people, could they go to find minds which were dealing with the subject with the right mode of thought and the right approach? It was not difficult to-day to find men extremely skilled in one particular line of transport, but to find people who had made a practice and a habit of looking at the thing as a whole, and taking into account other aspects than their own, was still a novelty. The younger men in transport, however, were beginning a mode of thought which would, later on, become a hatit, and he had no doubt that in thirty years' time people would look back upon these days when men thought of transport in watertight compartments as days of barbarism. The Institute of Transport, and particularly the young men growing up in it, would provide not only the mode of thought, but a body of doctrine, experience and technique which would enable transport problems to be looked upon as a whole. But many trials had to be gone through in an Institution as with an individual, and there might be many deviations from the straight line he had been talking about, but a collection of people such as they had in the Institute of Transport, listening to each other's papers and knocking up against each other's problems and eventually evolving a kind of collective view of the whole problem, must result in a body of highly intelligent men actively engaged in considering the problems of transport. So they would pass through their trials. If the membership went down, enthusiasm was likely to flag. That was natural, but he did not think they would wish to be without their trials, because out of weakness came strength. They could not short-circuit trials and troubles, but under the wise direction he was sure they had, there was no reason why their progress towards the ultimate goal should not be extraordinarily rapid and direct.

Need for Self Sacrifice.

The only fund of instructed technical opinion upon transport as a whole, was that fund which the Institute of Transport was gradually building up, but this fund of instructed opinion could not be obtained, even on the part of the younger members, without some self-sacrifice. They were each engaged in some particular branch of the industry, and if they saw that a paper or lecture was to be given on a certain subject, and said, "I am not in the least interested in that and I shall not go," the other man would not come to the lectures in which oneself was interested. Only by a certain amount of self-sacrifice, by taking an interest in the whole, and by realising that all transport problems must sooner or later be correlated, could the objects aimed at by the Institute of Transport be achieved.

What was the idea of a University? A man went to a University, but could not possibly study in all the faculties at once. He might be studying in the arts, and not be the least interested in theology or law, and could equally well study his own particular subject at a technical college devoted entirely to that subject; but the whole advantage of a University was that it gave a background of general culture into which the student fitted his own particular subject, and by meeting men who were studying other subjects and by taking part in the debating societies he learned what part was really his in the general scheme of things, instead of getting the self-centred idea that his was the only subject worth while, and he would also realise that other men's lives were devoted to subjects as valuable as his own. The work of the Institute of Transport, carried out on those lines, would be of enormous advantage to members, and particularly to the younger men, and would also be of immense public value. He had been a worker in large institutional organisations, somewhat on the circumference and right away from his fellows except by correspondence, and he did not know whether he was doing his work up to the standard of men in other districts, but he knew the immense accession of power and interest that came to people on the circumference immediately they were incorporated in a Society like the Institute of Transport, and he had known the whole standard of efficiency and interest raised almost perceptibly in a few months by an efficient journal, by meetings, and the interchange of ideas, instead of living in isolation and ignorance of what the other man was doing.

Get Together.

If one was isolated and pursuing one's way along one's own particular road, it took an extraordinary lively intelligence not to become sluggish, and the fact that in their Institute a man had to whip himself up to prepare a paper was not only good for him but it quickened interests in others and men did not become isolated.

Some men, because of their isolation, were so full of their own importance and ideas that they were in danger of becoming cranks. If in their early days they could have been in the society of men of their own calibre who were able to criticise their particular ideas, those ideas would have been put into proper perspective, and instead of becoming cranks because of their isolation, they would have been useful members of Society. Common association quickened thought and prevented men from being unduly influenced by their own ideas; there was a ventilation of ideas and from that the best ideas were obtained, bad ideas would die, and the good survive, judged by the tribunal of their peers. There was, at the present time, a body of active thought going forward progressively and at a gradually accelerating speed.

The quickening of ideas was a matter of tremendous value. Some of his hearers would, no doubt, be pursuing their activities in connection with the Institute with the idea of individual self-improvement, and, with that improvement, monetary advancement. They were not in the least unworthy motives nor in the least to be decried, but they would be conscious at the same time that there were higher values which could not be stated in money but which would increase the interest of their lives and make them feel that they were really filling their place with credit to themselves and credit to their Institute.

In large transport undertakings, men were necessarily engaged in one narrow field, but anything that told one which particular cog in the whole machine he belonged to and what the whole machine was doing, meant that one's everyday task was lifted in value. He knew that from personal experience. He had done the worst and dullest kind of clerical work,

Digitized by Google

and knew how extremely subdued one could become in one's whole tone unless one knew one was part of a larger thing in which one could take an interest.

He remembered that in the old days of the second division clerks of the Civil Service it was usual before a man was considered eligible for promotion to a task requiring large adminstrative judgment for him to spend twenty or twenty-five years in one job, but this fact had the result, in many cases, of unfitting him for the higher post; he had lost elasticity of mind and zest to enable him to grapple with a new problem. He believed that the same problem existed in the transport industry. It certainly existed on the railways. It was absolutely essential that men should be intensely expert along individual lines, and very often they bought that experience at the sacrifice of resilience of mind and power to survey.

How often had he heard it said when promotions were being discussed that so and so was a rattling good man for his particular job, but it was doubtful whether he could tackle a larger job as it was different from anything he had done before, and he could not help feeling that if that man had been given something wider to think about he might have been fitted for the bigger job.

Men Must Have a Grasp of General Principles.

Business to-day was requiring more and more the man of principle—he was not speaking of moral principle, but of men able to grasp general principles.

The young men who were joining the Society were doing themselves good, doing the profession they had chosen good, and doing the Institute good.

The Turning of the Ways.

We were at the turning of the ways, and no-one knew whether the next phase of individualistic, capitalistic industry would succeed or fail. Nobody knew whether it was possible to supersede that system successfully by a highly collectivist or socialist form. We were passing through a transitional stage and we did know that that transitional stage required some submergence of individual ideals for the general good and the greater ideal of public service, and we did know that unless we were imbued with that spirit which the Institute stood for we should never successfully attack that problem either from the individualistic or the socialistic end. Both forms of control would require the highest qualities of brain and power that we were capable of, and therefore he urged the members to continue in the good work to which they had put their hand. They must encourage all to take a broader and larger interest in the economic problems upon which the destiny and future of our beloved country depended.

The Chairman, proposing a hearty vote of thanks to Sir Josiah Stamp for his address, said that their President had advocated the taking of the broad view; they must not tackle their work in a narrow way, but be broad-minded, so that their efforts would benefit the whole country.

The Metropolitan Graduate and Student Society offered the young transport man the opportunity to enlarge his knowledge by attending lectures, listening to the reading of papers, and asking questions, and also the opportunity to make friends with others engaged in the profession. These were great advantages, broadened one's outlook, and helped one to solve problems which would result in the economical running and efficient working of all forms of transport.

They appreciated the important place held by transport in relation to the success and happiness of the country, and they would look at the question from the national point of view for the good of the whole. They must cultivate a broad outlook and not a narrow watertight outlook. Their programme of lectures and papers for the Session embraced all forms of transport.

Tilling-Stevens Appointment.

Mr. T. B. Goodyer, O.B.E., A.I.E.E., M.Inst.T., who recently retired from the position of Tramways Manager to the Croydon Corporation Tramways, has taken up the position of Municipal Sales Manager with Tilling-Stevens Motors, Ltd., of Maidstone. Mr. Goodyer was born in Glasgow and educated at the Royal High School, Edinburgh. On leaving school he spent several years in the office of the late Mr. D. W. Paterson, Solicitor, and for many years Secretary to the Edinburgh Street Tramways Company, of which system Mr. Goodyer, Senior, was the Traffic Manager. In 1884, he joined the Traffic Office Staff of the London Road-Car Company, Ltd., and some months later was appointed Manager and Secretary to the Northampton Street Tramways Company. His next appointment was that of Manager to the West Metropolitan Tramways, part of which is now merged in the London United Tramways. Mr. Goodyer resigned this post in order to take up, in October, 1887, the appointment of Assistant Traffic Manager to the Birmingham Central Tramways Company, Ltd., and in 1894, he was appointed Traffic Manager. In 1896, a new company, called "The City of Birmingham Tramways Company, Ltd." was formed to take over and work the "Birmingham Central," and he remained with the new company until April, 1898, when he resigned to become the General Traffic Superintendent to the British Electric Traction Company, Ltd. During 1900, Mr. Goodyer spent several months in the United States and Canada, inquiring into street railway practices in those countries. In 1902 he was appointed General Manager at Croydon for the British Electric Traction Company, Ltd., the lessees of the Croydon Corporation Tramways, and held that appointment during the currency of the lease, which terminated in May, 1906, from which period he occupied the position of Tramways Manager to the Croydon Corporation, which appointment he has recently vacated. Mr. Goodyer was elected a member of the Executive Council of the Municipal Tramways Association in 1911, and in 1918-19 occupied the Presidential Chair. He is also a member of the Tramways and Light Railways Association, and has served for several periods on the Council of that body. From 1907, Mr. Goodyer acted as Honorary Secretary to the Metropolitan Association of Electric Tramways Managers until February, 1919, when, on that Association being dissolved, and the Metropolitan Municipal Tramways Council formed, he took over similar duties. He also acted in a like capacity to the Manager's section of that body. During the War, on the Board of Trade setting up a Tramways Committee to deal with various matters affecting that industry, he was elected Honorary Secretary to the Tramways (Board of Trade) Local Advisory Committee for No. 1 Area, Metropolitan, East and South Coast, and, in addition, served on numerous committees in connection with Tramways transport. At the Annual Conference of the Municipal Tramways and Transport Association held in Manchester, in September last, Mr. Goodyer was elected as Honorary Member in view of his distinguished services in the Tramways Industry.

MR. T. B. GOODYER, O.B.E., A.I.E.E., M.INST.T.

Busmen's Hours.

At the Licensing Committee of the Blyth Corporation, the Committee, in the interests of the safety of the public, considered the conditions of employment of bus drivers and conductors, with respect to the number of hours worked, and recommends that the licensed omnibus proprietors be informed that the Council intends to take into consideration the number of hours worked by omnibus drivers and conductors in the interests of public safety, and to attach certain conditions in respect thereto to bus licences, but that before any steps are taken in this direction the licensed omnibus proprietors be invited to attend a conference with this Committee to consider the matter.

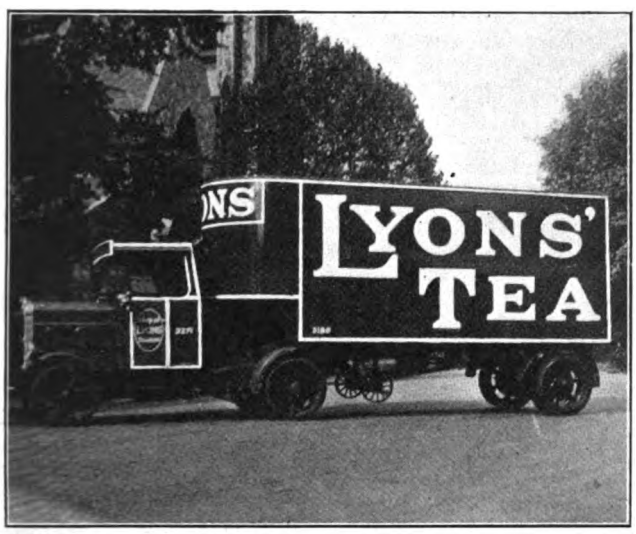
The Trailmobile.

This chassis, which is imported from America, is being used by Messrs. J. Lyons & Co., Ltd., and we are indebted to Mr. W. H. Gaunt for some particulars which will be of interest to our readers. The unit is drawn by a Scammell tractor. Mr. Gaunt says:—

I was very taken with these in the United States, although they are used in two separate directions:

One is as you see them in our employ—for local



Photo] [World's Carriers.

THE TRAILMOBILE AND SCAMMELL TRACTOR COMBINATION.

deliveries, i.e., we convey goods from a centre to sub-centres using four Trailmobiles to one tractor, so that the sub-centre can have a load each morning for unloading during the day, when the tractor takes the empty back that was unloaded the previous day, giving the depot staff time to unload and put away into stock the goods at their routine convenience.

One tractor and four Trailmobiles will keep two centres going—the tractor doing two return journeys daily.

There is no need to limit this service for immediate local distribution.

The other method utilised in the United States is by the railway companies, and I made a feature of this in giving evidence before the Road Traffic Commission.

A railway company having provided itself with a number of flat top low level railway trucks will utilise these Trailmobiles for collecting from large city centres, like a warehouse or receiving depot. One tractor will collect and push on to the railway trucks longitudinally a number of these Trailmobiles, and leave them to be taken by train to a town 80 or 150 miles away. The train is then met by another railway owned tractor which takes the Trailmobiles to a similar warehouse or distributing centre in the city of destination. So this shuttle service goes on.

You will remember that in the United States the traffic is divided into what is known as car load lots and less than car load lots—the car load lots being wholly dealt with by the railway companies, the less than car load lots, comprising what is practically equal to our C. and D. miscellaneous traffic in this country, being amassed by express or transit companies who bunch the traffic into a car load lot from one city to another.

It is in this direction that the railway companies in the United States are utilising the Trailmobile system.

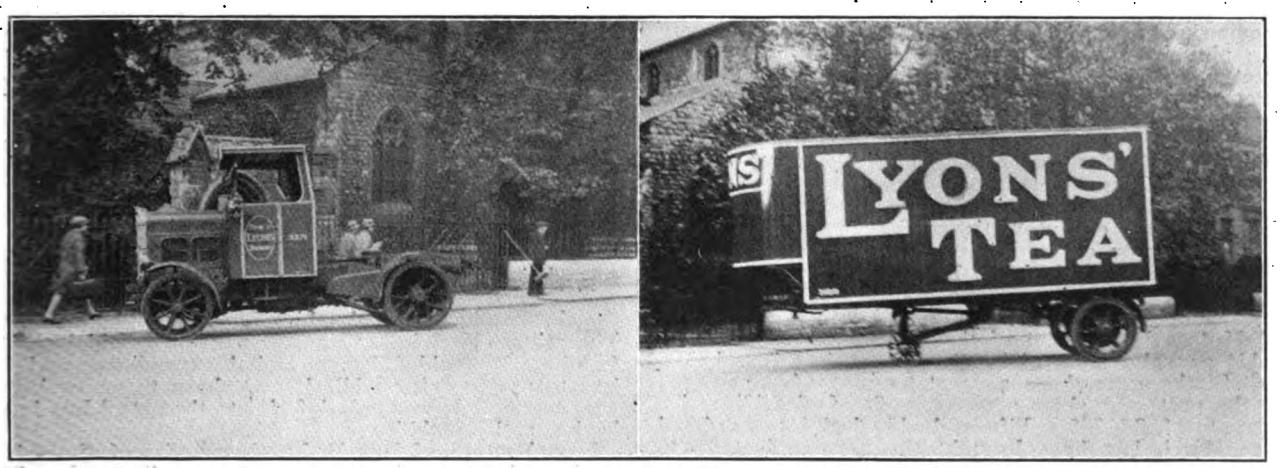
How far the English railway companies can go in this direction remains to be seen, but I have a belief that the experiment will be very well worth trying, even with co-ordination between the railway company and collecting firms like Pickfords and Carter, Paterson's, and the example would be that Pickfords would amass enough traffic in some city centre for Birmingham to make it worth while running one of these vehicles to the railway terminal in London, and the railway company would get their share by conveyance to Birmingham or Manchester, to be dealt with by Pickfords at the other end.

I am not suggesting that a vehicle of the type so high as that we have devised will be at once able to be conveyed by any ordinary English rolling stock on account of the bridges. In the United States, of course, the bridges are very infrequent—the rail trucks themselves are of a lower average buffer height, and the Trailmobiles are not perhaps quite so high.

The distinction between this system and other forms of trailer bodies is in the supporting wheels and the quick hitch couplet.

A Trailmobile is the only method where the wheels drop down so that the empty Trailmobile can be moved about the yard by hand labour, and is, therefore, much more mobile and has the advantage of being able to be bumped by another vehicle by accident without a crash.

The type which has the hinged leg or telescopic leg cannot be moved by hand labour, and if it is hit by an adjoining vehicle it may be turned over as the prop is broken.



Photos] [World's Carriers.

LEFT: THE SCAMMELL TRACTOR. RIGHT: THE TRAILMOBILE UNCOUPLED.

The quick hitch is so automatic and comprehensive that one man, without any guidance, can back up at any angle less than a right angle with instantaneous coupling or release, and in the dark and any awkward positions this has a great advantage over other systems.

The Normand Garage, Limited, which is our subsidiary company for motor construction and repairs, have done the necessary work on this side, and have the agency from the Trailmobile Company for the United Kingdom.

Merseyside Notes.

FROM OUR OWN CORRESPONDENT.

Appointment.—Mr. Allen Walter, secretary of the Liverpool Cart and Motor Owners' Association, has been appointed an employers' representative for the Court of Referees under the Unemployment Insurance Acts. With his experience of conditions in the cartage and haulage trades he should be a very useful member.

Trade Conditions.—Happily there are now signs of busier conditions in the dockside cartage and haulage trades. Usually at this time of the year, bigger quantities of inward traffic pass over the quays, consisting chiefly of foodstuffs, fruit and raw sugar. This improvement, although a little bit overdue, is likely to be maintained. One very satisfactory feature of local trade is the almost record arrival of wheat, which has caused local warehouse facilities to be taxed to capacity. As regards cotton, during four weeks of September, the shipments amounted to 562,000 bales compared with 438,000 for the corresponding four weeks of last year. Ninety per cent. of these consignments were handled at Liverpool.

Change of Address.—Marstons Road Services, Ltd., no longer carry on business from Preesons Row. Their office premises have been transferred to Lightbody Street (at the corner of Great Howard Street), Liverpool. Their telephone number (five lines) is 1790 North.

Big Scale Co-ordination.—The local authorities in Lancashire, over 150 in number, are likely to be joined by those of Cheshire and the West Riding of Yorkshire in a conference on the problem presented by the growth of public road service motor traffic. Last July representatives of all the Lancashire local authorities were called by the County Council to a meeting at Preston to discuss the situation. A resolution was passed asserting that there was urgent need of new legislation for the control and regulation of public service vehicles plying for hire or reward, and a committee was appointed to draft a Bill to be promoted in Parliament and to report to a subsequent conference. It now appears that the authorities in the neighbouring counties of Cheshire and the West Riding feel an equal interest in any prospective fresh legislation on this subject, and, although nothing has yet been arranged, it is probable that the next conference will be a joint one of representatives of authorities in the wider area.

Position of Automatic Traffic Signals.—There is a feeling amongst motor users that the automatic traffic signal at the junction of Whitechapel and Church Street, Liverpool, is confusing to drivers because it is erected at a point where it is easily obscured by the tramway traffic passing along the two thoroughfares. The signal is erected on an island at the junction of both roads, which is somewhat unusual for a busy city area. If four signals were placed at the east and west corners of Paradise Street and Whitechapel they would be fully visible to drivers of motor vehicles and tramcars and also to pedestrians. Bootle has just adopted the plan of four separate signals at busy corners: Manchester and Preston have had it for some time. The Transport Committee of the Chamber of Commerce recently made approaches to the Chief Constable on the point and were informed that the whole question of automatic traffic control was under the consideration of the Ministry of Transport.

Big Profits from Municipal Buses.—An increased profit on the buses and a decreased profit on the trams for the year ending March, 1929, is reported by the Tramways and Motors Department of the Birkenhead Corporation. In his annual report to the Committee, just issued, Mr. Cyril Clarke, general manager, states motor bus accounts for the past year show a gross profit of £55,397 and a net profit of £26,705. Fifteen double deck buses ordered since March last have brought the present fleet up to ninety.

Obituary.—Mr. William Burgess, a Liverpool cartage contractor, of St. Domingo Road, Everton, collapsed whilst walking down Conyers Street and subsequently died at Stanley Hospital from haemorrhage.

Chester's Change Over.—Various makes of motor buses were demonstrated at Chester on September 19th. before the Chester Tramways Committee. The original intention of the Committee was to have 16 single deckers, but this decision was subsequently revised. The final recommendation to the City Council was for the purchase from Associated Equipment Co., Ltd., of ten 6-cylinder engine, thirty-seater, single deck motor buses at a cost of £1,394 10s. each; and six 6-cylinder engine, fifty-seater, double deck motor buses at a cost of £1,770 each.

Personal.—Mr. H. H. Lancaster, traffic superintendent, Blackpool Corporation, who on October 1st took up a similar position with the Leeds Corporation, prior to leaving Blackpool was presented with a cheque by members of the Blackpool branch of the National Association of Local Government Officers.

Rivalries in Rates.—Owing to the exceptional rates that are now quoted by the railway companies, the tendency has been in the direction of lower freight charges for road consignments during the last few months. The classes of traffic particularly affected are cotton, green fruit, dried fruit, provisions and canned goods to Manchester and the Lancashire towns. The railway companies are quoting exceptionally cheap rates which include cartage at both ends. Up to recently, haulage rates had not been subject to much fluctuation, but haulage contractors are now showing enterprise and resource in coping with the new conditions, especially by the utilisation of large capacity up-to-date rolling stock. For local haulage, increased use is being made of petrol tractors.

Warrington Cartowners' Decision.—Warrington horse owners and carters held a meeting last month at which it was decided to revive the May Day horse parade. Mr. G. Leedam (representing the L.N.E.R.) stated that his company and the L.M.S.R. were quite prepared to give the movement whole-hearted support and to do all they could to make it a success. Councillor Harry Fairclough said the mistake that had been made in the past was that some firms were apt to go too far in the way of providing new harness and decorations, and too expensive coach building for the ordinary teamowner to compete with. It was agreed that the parade should be confined to working horses which had been owned by exhibitors for at least three months prior to the parade, and that horses which were purely exhibition animals should not be eligible. An executive committee was appointed to carry out the arrangements.

Fire Risks on Rail-borne Traffic.—Liverpool cartage contractors, particularly those engaged in the transport of raw cotton into railway stations, are hopeful that Clause G in Condition 3 of the Statutory Rules and Orders of 1927 Railway Terms and Conditions of Carriage, regarding the railway companies not being responsible for damage by fire to goods in transit, will be deleted. In various parts of South West Lancashire the attitude of the railway companies in officially disclaiming liability for loss of goods in transit through fire has engaged attention, and it is thought that one result of this might be to divert certain classes of traffic from the railways to road vehicles. There is a possibility that the whole question may be taken up by the Associated Chambers of Commerce.

In Defence of Electric Vehicles.—Mr. W. I. Marshall, manager of Messrs. Dick Kerr's Works, Preston, in an address to Preston Rotarians, said it had been definitely proved in towns in which tramcars, railless electric vehicles and petrol buses operated under equal conditions, the electrically propelled vehicles were slightly the faster. The railless electric car was the passenger vehicle of the future. It avoided heavy capital expenditure and had less to pay in rates, while it was cheap to maintain and easy to run. It was only inferior to the petrol bus in not having entire mobility.

New Feature of Bus Body.—Inspectors of the Liverpool Hackney Carriage Department, on September 27th. examined a distinctive type of six-wheeled double decker motor bus which may be operated in Liverpool by the Merseyside Touring Co., Ltd. (Garlick, Burrell and Edwards, Ltd.). The Tilling-Stevens petrol-electric chassis carries a body by Massey Bros., of Wigan, to seat 64 passengers. It has two staircases from the top deck and the exit door is controlled by the driver.

Licences Transferred.

The Licensing Committee of the Otley Urban District Council has transferred the licences of Messrs. Bolton and Wood's Cookridge bus service to the West Yorkshire Road Car Company, Ltd.

Licences Granted.

The Watch Committee of the South Shields Corporation has granted four licences to Phillipsons Coaches, Ltd., in connection with their service between Newcastle and London.

Digitized by Google

Manchester Notes.

FROM OUR OWN CORRESPONDENT.

Disturbance in Haulage Circles.—In these notes last month mention was made of the concern felt in motor haulage circles by the action of the railway companies in issuing in the early part of August last new rates "subject to the approval of the Railway Rates Tribunal." This authority meets this month. The committee of the Manchester Transport (Owners') Association has been giving careful consideration to the likely effect of this new move on the part of the railway companies, which has been to cause some traders to endeavour to depress motor haulage contractors rates down to the level of the railways. Thus hauliers seem to have been pitchforked into another phase of competition and many of them feel genuinely concerned. In August the railway companies issued a list of towns in respect of which particular traffic could be accepted at the rate of 8s. 6d. per ton delivered, for lots of two tons and over. Subsequently this list was withdrawn and a shorter one substituted. This has caused a certain amount of disturbance in haulage circles, where there is a feeling of unsettlement on the point of how the rates problem will be solved.

Horse Hire Contracts.—Manchester Corporation Paving, etc., Committee has accepted the tenders or the following firms for the hire of horses and carts:—G. Massey & Sons, J. Holt, J. Hancock, G. Welsby, J. Crossland, Jnr., J. Bray, Hannah Lear & Sons, J. H. Peck & Sons, R. Melling, T. Lamb, W. Hayes, W. Tonge, J. W. Cage, P. Lawless, C. Knill, S. Thorpe, G. H. Brocklehurst, D. Clays, T. Seward, C. Cooper, J. & G. Evans, J. W. Hilton, A. Peck, G. Farrell, J. W. Street, Barber Bros., J. A. France, South Manchester Coal Co., G. Wilson, W. & S. Royle, D. Middleton, J. A. Shafto, H. M. Evers, I. Wharton, E. & R. Hughes, J. Walmsley, J. Bacon, A. R. Hughes, W. Lancashire, W. E. Davies—all of Manchester. These names were communicated to the October meeting of the Manchester City Council.

Motor Van Library Service.—Manchester Corporation Libraries Committee provides motor van service for the exchange of books. During the past year 9,311 books were transferred by this means from one library to another, an average of 37 volumes for each day of service.

Drivers' Hours and Wages; Official Statement.—Although drivers' rates of pay and hours of work in both passenger and goods transport are governed by agreements existing between the employers and employees organisations, so many comments, alleging that long distance motor bus drivers are being overworked, have appeared in the Press that Mr. H. Howard Robinson, secretary of the Manchester Transport Owners' Association has felt obliged to point out to the public that the existing agreements are being observed by firms who are established and can be described as "organised road transport." "It is in the interests of these firms, that provide comfortable travel at proper times, that I feel it only fair to point out," says Mr. Robinson, "that the failure of a few cannot be permitted to create a stigma for those who are engaged in regular business on proper lines. My earnest hope is that the public will not lend support to any concerns that do not give proper value for money paid for transport, whether it be for passenger or merchandise; but in my long experience of transport questions I find that many of the public are usually prepared to support the person who offers service at the lowest possible cost, which, unfortunately, is at times uneconomic." Representatives of the Manchester and Salford Trades Council had an interview with the Manchester Watch Committee on the general subject on October 3rd. They allege that certain companies operating vehicles in agreement with the Corporation are not observing trade union rates of pay and conditions, contrary to the fair contract clauses of the Corporation.

New Type of Taxicab.—Manchester Watch Committee has licensed the new model Ford taxicab, which is the first to be put on the road in Europe. The chassis is low built and it has a 35 against a 26-foot steering lock in the old cabs. Another feature is four-wheel brakes. The passenger has the facility to communicate with the driver by means of a loud speaker dictaphone. The Council is under an agreement with the Taxi-owners' Association not to issue more than 300 licences, so there can only be a limited number of the new type except for the replacement of old vehicles.

One Way Traffic.—Manchester Corporation Traffic Congestion Special Committee proposes to introduce one way traffic in Bridge Street and King Street West. The Committee is also considering an extension of the system to other suitable streets.

Yorkshire Notes.

FROM OUR OWN CORRESPONDENT.

Effects of Increased Speed.—The effect of the increased speed limit for heavy vehicles is being shown in the new purchases by private owners, and, to a lesser degree, by haulage men, and there is to be seen on the roads of the West Riding now many new light transport vehicles of the fast type. The textile industry has ramifications in various parts of the country, and the rapid transport of partly finished goods to and from the West Riding is a matter of importance to those branches which are interested in this work.

Bradford's Awkward Question.—The Minister of Transport has been put a difficult question by the Bradford Watch Committee in regard to conditions regarding wages and hours of work of drivers and conductors of motor omnibuses licensed in the city. Reference was made in these notes some time ago to the frequent references to the terms under which private motor bus employees were engaged, and apparently Bradford Corporation has had under consideration the fixing of conditions to the granting of licences. In reply to a question on the point, the Minister of Transport has replied, however, that he was unable to express an opinion on matters of law, but it was also undesirable that the Watch and Licensing Committee should become a wage fixing authority. The Minister points out, however, that if any employing company was found to be imposing conditions of service on drivers and conductors which might lead to danger to the vehicles or the public, they might take action. He was unable to lay down any general principle, however. In view of this reply the Watch Committee decided to take no action in the matter.

Tramway Difficulties.—Several of the authorities in Yorkshire are faced with the difficulty of maintaining the tramways in face of the advent of newer forms of transport. Bradford has been complaining that some of the passes issued for use on motor buses running into the city are not in keeping with the condition imposed on the licences that fares should be 50 per cent. more than tram fares. Their insistence upon this condition being observed has led to a request for a conference on the matter. At York, the future of the passenger transport system is more or less in the melting pot. It is calculated that in view of the large capital debt, the scrapping of the trams would involve the city in a rate of 8d. in the pound for 10 years, and the manager (Mr. R. S. Asher) suggests that the present system should be maintained for ten years, and as routes become worn out railless services substituted. The Tramways Committee does not see its way to recommend what system should be adopted when the trams are scrapped, but they recommend the discontinuance of the present railless system at the end of the year, and the replacement by motor buses. Other proposals are the selling of the Piccadilly car depot and the building of a new depot at Fulford. The Committee seek powers to add to the fleet of motor buses. At the present time the York authority maintain trams, motor buses and railless vehicles. In a short time Bradford will convert the Allerton route of tramways to railless.

The Anti-Noise Campaign.—The Todmorden police were unsuccessful in one case in their energetic campaign against motor vehicle drivers on the complaint of noise, when a Queensbury haulage contractor contested a case taken under the new noise regulations and was successful in getting a dismissal. A police officer gave evidence that he stopped the defendant's lorry because it was making an excessive noise. He found the tyres were badly worn and uneven "causing the vehicle to bump about." The owner said the lorry had travelled 1,800 miles since the complaint was made, but no further comment had been made. The tyres were 3½ in. thick, and new tyres were only half an inch thicker. The lorry made the usual noise made by tyres on a wet day, and new tyres would make no difference. He intended to use the existing tyres 6,000 miles more, and a leading tyre manufacturer had supported him in the advisability of doing this.

Licensing at Skipton.—The Skipton Urban Council intends to compel local operators of motor bus services to licence their vehicles. Up to the present none of the services running into Skipton have been licensed, and the town has become an important centre, being conveniently situated for services between Yorkshire and Lancashire. Here some of the long-distance services have made a halt on their way to Blackpool and Morecambe as the catering arrangements are good.

North-East Coast Notes.

FROM OUR OWN CORRESPONDENT.

Merited Compliment.—Mr. John Petrie, general manager of the Northern General Transport Co., Ltd., figured in the "Men we Know" section of the Newcastle "Evening Chronicle" recently. The writer, referring to him as the man "who controls one of the biggest omnibus organisations in the North of England," said:—"Many and responsible though Mr. Petrie's duties are, it is almost impossible to perturb him. He is modest, too, and seldom leaves his little den. But all the hundreds of employees who are under his care know that he is the man who looks after them. Mr. Petrie has spent his whole life among omnibuses, and no man is more worthy of the position he holds . . . . . People of the North owe a great deal to him, though few realise it. Most of the delightful national tours made by Northern omnibuses are organised by the 'Northern's' far-seeing chief."

Big Change-Over.—The controlling interest in United Automobile Services, Ltd., was formally taken over by the London & North Eastern Railway Company on October 1st. Questions that are being asked by regular passengers are:—(1) Will fares be raised? (2) Will the services be altered, and (3) will the women conductors be replaced by men? An official of the railway company at York, interviewed on these points, said that no revolutionary changes were contemplated, and that rail and bus fares in the Tyneside area being in most cases identical, it was scarcely likely that any increases would be made. The official added that it was, naturally, likely that an endeavour would be made to secure co-ordination between the train and bus services. He could say nothing as to changing conductors from females to males, except that he did not suppose the point had been discussed. On most services controlled by the L.N.E.R., however, the conductors are males.

Impressions of Germany.—Mr. C. E. Baldwin, secretary and general manager of the Blyth Harbour Commission, addressing the members of Newcastle and Gateshead Chamber of Commerce on September 30th, gave some interesting impressions of a fortnight's tour in Germany. The street traffic in the big towns consisted very largely, he said, of trams, there being very few buses, though he saw some rather heavy six-wheel chars-a-banc and, of course, taxis. He thought that the Germans aimed at keeping their resources in their own country, and while they could generate electricity, they would have to buy petrol. The trams were usually light, and trailers were used. England came out top in the management of street traffic, but Berlin uses robots extensively; and their street cleaning compared favourably with our own.

Tees Tramway Crisis.—The Middlesbrough Tramways Committee and the Joint Committee in control of the Stockton and Thornaby tramway system are conferring on the serious position of the latter. It has been stated by an expert that the system needs an expenditure of £80,000, but it is doubtful whether its future warrants such a huge outlay. Hence the suggestion that the tramway be scrapped in favour of electric trolley or petrol buses. Middlesbrough recently spent large sums of money on track relaying, including the route on which the Stockton and Thornaby through service runs. To relay the whole of the Stockton-Thornaby system alone would cost over £60,000.

Inter-availability of Tickets.—It has already been announced that, in several areas where the L.N.E.R. controls the bus services, bus passengers may return by rail, or vice versa. This is undoubtedly a very real convenience in many cases, and would be particularly appreciated by bus trippers to the coast, who have a habit of all wanting to return by the same last bus in the evening.

Huge Bus Station.—Olympia Hall, at Middlesbrough, one of the largest buildings of its kind in the country, has been acquired by United Automobile Services, Ltd., for a garage and bus station. It was erected six years ago as a boxing stadium, and is estimated to hold 15,000 people. Only three months after its completion, however, the hall was closed and subsequently sold.

L.N.E.R. and "Northern."—The L.N.E.R. has acquired a large interest in the Northern General Transport Co., Ltd.—though, it is understood, not a controlling interest. The railway company is already associated with many road transport concerns in the area, and this agreement marks an important step forward in that policy.

First-Aid for Bus Employees.—Drivers and conductors on the "United" buses have been encouraged for some time past to acquire a knowledge of first aid by attending ambulance classes.

Midland Notes.

FROM OUR OWN CORRESPONDENT

British Industries Fair.—Important additions are to be made in the arrangements for the forthcoming British Industries Fair which will take place in Birmingham in February. More space is being provided for exhibits and greater convenience for visitors. Another fifteen acres of land adjoining the present site is being purchased in order to allow for extensions being made from year to year. The opening date of the 1930 Exhibition is February 17th. Stand lettings already beat previous records.

Classes in Transport.—In order to enable classes to be provided covering the full syllabus of the examinations for the Institute of Transport, the Birmingham Education Authority has appointed Mr. J. B. McIntosh, B. Com. as full time lecturer in Economics with special reference to transport at the City of Birmingham Commercial College. Mr. McIntosh has been specially trained on the Great Western Railway.

Sole Booking Agency. — The Midland "Red" has recently appointed Messrs. Joseph Riley, Paradise Street, Birmingham, as sole booking agents. This is a new departure on the part of the company as regards forward bookings.

Railway Developments. — Improved terminal accommodation on a large scale is to be made by the L.M.S. at Birmingham and Stoke-on-Trent for goods trains. The scheme will include the construction of new sidings.

Big Warwickshire Road Schemes. — Proposals have been approved by the Warwickshire County Council to spend £1,000,000 on huge road schemes throughout the county. The work will be spread over a period of five years, and some of the schemes sanctioned are very important.

Improvements at Coventry.—Coventry City Council has adopted another instalment of the reconstruction scheme which will transform the central part of the city. It will effect considerable widenings of streets and a Parliamentary Bill is to be promoted to enable these improvements to be carried out.

Buses at Leamington.—The Leamington and Warwick Electrical Traction Co., Ltd., recently obtained Parliamentary Powers to operate buses in place of trams and is starting with twelve C.F.6 Daimlers of 32-seater capacity, six of the bodies being built by Strachans and six by the New Avon Body Co., of Warwick.

From Trams to Buses at Gloucester and Cheltenham.—Gloucester City Council has started its first bus service in place of trams. This is on the Cemetery Road route. Buses will next operate on the Tuffley Road routes, and it is expected that in time the trams will be entirely superseded, as they have been unprofitable for some time. At Cheltenham the change is being effected by the Cheltenham Traction Co., Ltd.; ten double-decker Guy buses are being delivered at once with ten more to follow, and five saloon vehicles at a later date for cross-town work. The change involves an expenditure of £60,000, but a saving of £6,000 to £8,000 a year is anticipated as against the cost of operating the trams.

Potteries Bus Merger. — The Potteries has for some time provided plenty of excitement of one kind or another in the bus world. This is largely due to the fact that though the Potteries Electric Traction Companies is the biggest single operator of buses in the district there are altogether some 400 or 500 vehicles owned by approximately 100 different proprietors, and there has been keen competition in many ways. The announcement is now made of the formation of a private limited liability company called the Associated Bus Companies, Ltd., one of its objects appearing to be to secure the ownership and control of all the private buses in opposition to the Potteries Electric Traction Company and the companies allied with it. It is thus possible that in the near future there will be only these two companies in the Potteries.

G.W.R. Link-Ups.—Those who know the country between Oxford and Worcester will appreciate the inconvenience due to the railway stations serving this district being so far away from the townships. When the G.W.R. line was constructed this trouble could not be avoided unless the line had been made very circuitous. Now, however, the G.W.R. is getting over the difficulty by operating buses in conjunction with trains at all the stations so situated.

Coventry City Aerodrome.—It is understood that the Coventry City Council will purchase the Home Farm, Baginton, comprising 200 acres, for £12,500, and possibly 53 acres of land in addition, in connection with a scheme for the provision of a municipal aerodrome.

Digitized by Google

Hull Notes.

FROM OUR OWN CORRESPONDENT.

Joint Advisory Licensing Committee.—This body, which represents Hull, Cottingham, Hessle, and Sculcoates, has finished its first year of working and has passed a hearty vote of thanks to Mr. W. Coulson, barrister-at-law, the Clerk to the Hessle Council. Mr. Coulson has acted in the dual capacity of chairman and clerk, and having got the Committee well established, sought relief from both offices. Alderman H. Dean, ex-Lord Mayor of Hull, was appointed chairman, and the Hull Town Clerk was asked to provide someone out of his department to carry out the clerical duties.

Suffolk Horses.—Hull cake manufacturing and seed crushing manufacturers have again shown their appreciation of Suffolk horses. At the recent Breed Society's show at Ipswich, Messrs. Wray, Sanderson & Company paid 122 guineas for one gelding and 84 guineas for another, and a third was acquired by the Hull Premier Oil Company for 90 guineas. There are not many Suffolks in Hull, and even the uninitiated can pick out the acquisitions of the cake companies as they draw their heavy loads between the mills and the docks or goods yards.

The Great Oil Fire.—None of those who witnessed at close quarters the oil fire at Salt End, Hull's great oil port, will ever forget the scene or the sense of impending disaster which filled everyone for so many hours. The firemen and staffs of the different oil firms are to be congratulated upon the bravery they displayed. That the fire was confined to the paraffin tank of the Anglo-American Oil Company in which it originated seems little short of miraculous. It was only one of many huge tanks. For twenty-six hours it belched forth fire hundreds of feet high. Its nearest neighbour was a tank holding a quarter of a million gallons of petrol. For hours the flames actually lapped this holder. Every moment one expected to see it go up, but nothing happened. Chiefs of fire brigades from London and all over the country afterwards journeyed to Hull to make personal investigations on the spot. For years they had feared what might happen if fire broke out in one of these huge oil installations, and the events had exceeded their most sanguine anticipations. The lesson taught is that if threatened tanks are kept cool (and it was towards that end the Hull brigade directed most of their energies) there is no fear of them exploding. Another lesson is that the chemical mixtures now available are capable of extinguishing even a blazing oil tank of half a million tons capacity, but only if the supply is adequate and there is a sufficient number of lengths of hose to make a general attack.

Bus Drivers' Hours.—Hull Watch and Licensing Committee have decided to make it a condition of the granting of bus licences that the drivers shall not be on duty more than sixty hours per week. They take the view that they are as much concerned with the fitness of a driver as with that of his bus to preserve the safety of the public. Cases have been brought to their notice of drivers being at the steering wheel from 90 to 108 hours a week. In coming to this decision the Committee has gone somewhat ahead of the Hull, Cottingham, Hessle, and Sculcoates Joint Advisory Licensing Committee, of which it is the chief member. Representatives of the Joint Committee conferred with representatives of the omnibus companies, and it was agreed to recommend that each of the companies operating in the area over which the Committee has jurisdiction be asked to give an immediate undertaking in writing that the maximum working week of their drivers and conductors should be 60 hours, averaged over consecutive two-monthly periods. The representative of one company explained that he had no authority to commit them, but he had no reason to think they would not give the suggested undertaking. The conference did not recommend that the condition should be made a term of the licence, but the Hull Watch and Licensing Committee considered it should be, so far as the drivers are concerned, and decided accordingly. The Joint Advisory Committee, when the report was submitted to them, limited the operation of the recommendation to drivers and deleted the provision averaging 60 hours per week over consecutive two-monthly periods.

Corporation to Buy Oldest Dock.—Everything points to the Hull Corporation acquiring Queens Dock and making broad boulevards in the very centre of the city. Queens Dock is the oldest dock in Hull, if not in the country. It is constructed on part of the site of the old walls and moat, the land being given by the Crown to the original Hull Dock Company. Much of Hull's prosperity has originated from it, but now it is obsolete.

South Wales Notes.

FROM OUR OWN CORRESPONDENT.

Trams v. Buses.—The Llanelly Borough Council is to urge the proprietors of the local tramways service to abandon trams and substitute buses. This step is to be taken at tradesmen's solicitation. They complain of excessive noise of trams and the Council complains of traffic congestion caused by trams.

New Bus Control System at Swansea.—The Chief Constable of Swansea has formulated under Watch Committee approval a scheme for averting congestion in town centre by bus traffic. Under the Swansea Corporation Act, 1927, an area in circumference of one and a half miles from town centre is brought into this control and certain streets are to be prescribed to bus traffic and stopping to set down or pick up is forbidden in others, and the only lawful stopping places are scheduled. Certain streets, notably part of High Street and Dyfatty Street in town centre are made one way bus traffic streets, the latter a one way street for all traffic. The Ministry of Transport has to approve of the details and bus owners have the right to object, but it is not thought they will do so. A scheme for averting buses overcrowding is also being drawn up.

Fire Brigades Development.—The Haverfordwest Borough Council is to be recommended by a committee to spend £500 on a new motor fire engine.

Long Distance Services Development. — In the past month Westcliffe Motor Services, London, have instituted daily services between Cardiff and London and also Cardiff to Liverpool, Manchester, Birmingham, Coventry, and Bournemouth. The Cardiff agents are Messrs. Hinton and Britton, Ltd., Castle Garage, at whose premises is also the starting point. The Ministry of Transport has, after inquiry, over-ruled the Cardiff City Council's refusal of licences to Western Services, Ltd., and to South Mon. Motors, Ltd., Lydney, for services between Cardiff and London. The appeal success of South Mon. Motors, Ltd., is worthy of note by all long distance services proprietors, inasmuch as Cardiff sought to enforce the carrying of a conductor on these buses, although the seats are all pre-booked. The Ministry has decided against such a condition.

Appeals Decisions.—The Ministry of Transport has decided in favour of the appeal of the Newport (Mon.) Corporation against refusal of licence for occasional service from Newport to Lighthouse and service Newport-Pye Corner by the St. Mellon's Rural District Council. The Newport char-a-bancs proprietors had also protested against licences being granted on the ground that an occasional, when required, summer-time only service was tantamount to engaging in private hire, for which Newport has no statutory powers, but the objection was not upheld. The Ministry has also decided in favour of the Newport Council in the appeal made by Danygraig Motors, Risca, against conditions of licence issue of the Newport authority and refusal of eight additional bus licences.

Disputing Ministry Decisions.—Although the Ministry of Transport decided some time ago in favour of South Wales Commercial Motors, Ltd., in an appeal by the company against refusal of licences which had been held by a company out-bought by the appellants, it is only now that the Ogmore and Garw Council, the local authority whose decision was disputed, is putting that ruling into force.

The Level Crossings Nuisance.—The Carmarthenshire County Council has discussed the level crossings nuisance to traffic and the injury to trade and congestion of traffic arising therefrom. In particular, the Council instances the position at Station Road, Llanelly, where the main road of the borough and, therefore, the main stream of traffic, is intersected by a railway level crossing, the railway being a main line. Traffic interruption is continuous throughout the day. The County Council has now decided to ask the Ministry of Transport and the railway companies what financial assistance they will give if the County Council takes steps to avert the main crossings in the county.

Caring for Horse Traffic.—A public meeting was held recently at Haverfordwest to consider ways and means of making the streets safe for horse traffic. The meeting's feeling has since been communicated to the Town Council and was to effect that it was concluded that the system of shoeing could not be altered and that the only way to help horses was by keeping the streets well supplied with gritting of the size of the smallest chipping. The Council has decided to act on the suggestion.

Scottish Notes.

FROM OUR OWN CORRESPONDENT.

Traffic Congestion.—Like other towns Glasgow is faced with many problems in connection with the ever increasing traffic on the main roads. Since the Government has urged local authorities to try and put forward schemes for the relief of unemployment there is a general feeling that something should be done now without letting any more time slip in. A visitor from London at once notices the difference in the flow of the traffic as compared with that in the metropolis. He wonders until he sees that the trams occupying half the street are the stumbling block, but it must be said that Glasgow is, and has been, the city of the most efficient tramway system.

Building Over the Clyde.—An idea, not new by any means, is that the river Clyde should be covered in for the length of a quarter-mile. The open space thus created could be used as a huge railway and bus centre. There is much to be said for a scheme along these lines, and the only drawback seems to be the cost of such a huge undertaking. In continental cities rivers have been covered in but not on such a big scale as here suggested. Whether the idea will be taken up by the Corporation is doubtful but it is worth at least careful examination.

Bus Sickness.—A daily paper has made the discovery that some passengers suffer from bus sickness. On certain routes of a switchback nature one may expect that the swaying of the vehicle would have a bad effect on certain people. Also a long distance journey on a bus has made women feel squeamish. At the same time it must be pointed out that train sickness is not unknown. Nearly all the saloon buses on the road to-day are as comfortable as the builders can make them. Better ways of ventilating the cabins are being evolved so that passengers are being considered in every way.

Glasgow-Inverness Road.—Inverness-shire Road Board have decided to recommend the County Council to accept an offer from the Ministry of Transport to make a grant of 97½ per cent. for the reconstruction of certain sections of the Glasgow-Inverness Road, the estimated cost being £2,896,500.

Scottish C.M.U.A. — The Scottish Commercial Motor Users' Association continues to perform very useful work and all responsible owners should be members. During the past year many Provisional Orders have been promoted by municipal bodies and the Association in the interests of its members has taken exception to certain of the clauses which gave monopoly powers. Mr. John W. Loudon, the general secretary, has had a busy time and the affairs of the organisation are in the best hands with the genial Edinburgh solicitor at the steering wheel.

Ayr Tramways.—The annual report of Ayr Corporation Tramways shows a decrease in revenue of £3,041 as compared with last year. The decline in the takings from traffic is a little over 10 per cent.

Big Contract for Glasgow.—Messrs. F. D. Cowieson and Co., of Charles Street, Glasgow, have obtained the contract from the Glasgow Corporation for the supply of bodies for 100 buses to be of the standard central passage kind of the Cowieson patent type—that is three seats, a passage, and a single seat on each row of the upper deck. The contracts for the supply of chassis have been placed with Leyland Motors, Ltd. and the Associated Equipment Co., Ltd. The total expenditure involved amounts to about £175,000. The Corporation have now 106 double deckers in regular service but with others on order, plus spares, etc., the fleet numbers about 200.

Long Service.—The Tramways Committee of the Glasgow Corporation has decided to honour 100 of the employees who have completed 35 years continuous service since the system was municipalised in 1894. Mr. Lachlan Mackinnon, the general manager, has over forty years service which includes 7 years with the company which operated the tramways prior to municipalisation. He has the longest service of any in the service.

A Civic Week.—The Glasgow Corporation have decided to hold a Civic Week with the object of stimulating educational and commercial interest in the city. It will be the first venture of its kind, and April, next year, has been mentioned as a suitable date for the event. A strong committee has been formed and it includes representatives from the Chamber of Commerce, the Clyde Trust, Merchants' House, Shipping companies, etc.

Irish Notes.

FROM OUR OWN CORRESPONDENT.

Reckless Driving of Buses and Motor Coaches in the Irish Free State.—At a meeting of the Council of the Dublin Chamber of Commerce, the following resolution was passed:—"The Council of the Dublin Chamber of Commerce desire to direct the attention of the Government to the increase in the number of accidents, both fatal and otherwise, caused by the reckless manner in which heavy motor traffic, notably buses and motor coaches, is carried on in rural and urban areas; the Council would urge on the Government the necessity for amending the law dealing with the supervision, inspection and control of this traffic without further delay."

Industrial Pageant in Dublin.—One of the most interesting features of the Dublin Civic Week celebrations was the Industrial Pageant that was organised under the auspices of the Irish Industrial Development Association. No less than 164 vehicles of various descriptions took part in the procession through the leading streets of Dublin, headed by the Metropolitan Guards' Band.

Increased Imports of Motors and Motor Parts into the Irish Free State.—The Irish Free State official trade returns for the first seven months of the present year, which were issued in September, showed that from January 1st to July 31st, 1929, up to 5,155 motor cars, at a declared cost of £810,518, were imported into the Free State, as against 2,877 cars, valued at £498,241, during the first seven months of 1928. There were 710 commercial motor vehicles, valued at £129,672, imported during the first seven months of the present year, as compared with 329 motor vehicles, valued at £108,672, imported in the corresponding period last year. The value of motor car parts and cycle accessories imported this year up to July 31st was £277,333. Motor tractors and parts to the value of £591,253 were exported from the Free State up to July 31st.

Combined Road and Rail Transport in the Irish Free State.—In connection with the development of combined road and rail transport in the Irish Free State, an interesting announcement was made recently to the effect that the Great Southern Railways Company of the Free State and the Irish Omnibus Company had arranged that in future return tickets would be interchangeable on many of their principal road and rail services. This beginning, it is believed, will be followed by an extension of the arrangement to the entire system of road and rail traffic of both companies, and that it is most probable that road services by the buses will be extended in such a manner that backward districts will be included in due time, with the result that the greater part of the country will be brought into the combined system.

Problem of Control and Regulation of Road Transport Services in the Irish Free State.—On the subject of the development of combined road and rail transport that has now been put into operation in the Irish Free State, Senator O'Farrell, Irish Secretary of the Railway Clerks' Association, gave his views in an interview recently, in the course of which in part he said: To the extent that the purchase of this large bus company, the I.O.C., by the Great Southern Railways Co. and the recent decision to have interchangeable tickets by rail and road services, eliminate confusion, and give a better, and eventually, I believe, a cheaper service to the public, I welcome the recent developments, but I do deplore the tendency to push the great railway services into second place, and adopt a policy which tends to discourage the use of railways as an alternative to buses, notwithstanding the much greater comfort, speed and safety of the former. I also consider that it is the duty of the Ministry for Industry and Commerce to see that the measure of control in regard to fares, routes, safety appliances, minimum services, etc., for which provision is made in the Railway (Road Motor Services) Act of 1927, is applied to the new road department of the Railways Company. The acquisition of the whole of the I.O.C. by the Railways Co. now enables the Minister to exercise the same control over the whole of these road services as previously he exercised over the services run by the Great Southern Railways only. To this extent, also, the purchase of the I.O.C. by the Great Southern Railways Co. is a welcome development, inasmuch as it simplifies the problem of reasonable control and regulation of the road transport services in the Irish Free State, and makes less difficult the task of dealing with this problem of transport regulation in a comprehensive way.

Law Cases.

A POINT TO NOTE.

A DECISION of importance to the motor industry was given by Judge Moore, in the Southwark County Court, in an action in which Mr. W. G. Fish, C.B.E., of Sydenham Hill, S.E., sued Messrs. J. Sainsbury, of 10, Stamford Street, Blackfriars, S.E., to recover £2 17s. 6d., the damage alleged to have been done by the defendant's motor van to the plaintiff's motor car. The amount of the claim was admitted to be trivial, but the principle involved of far-reaching importance.

Mr. E. H. Hunter appeared as counsel for the plaintiff, and Mr. George D'Arcy Edmondson, barrister, for the defence.

The plaintiff gave evidence and said his car was stationary at the south side of Blackfriars Bridge when one of the defendants' vans backed into it, and caused the damage claimed. He sent in a claim to the defendants, and received a reply from an Assurance Company, asking the name of his insurance company, and declining to settle with him. He, plaintiff, refused to disclose the name of his insurance company, telling them that it was no concern of theirs whether he was insured or not, or who the company was. The Assurance Company thereupon informed him that unless he divulged the name of his insurers they could not settle with him, personally, but would make him take the case to Court, where he would have to prove the damage to his car. As they had adopted such an attitude, the plaintiff decided that he would make them pay, and he thereupon issued the summons against Messrs. Sainsbury.

After the damage had been proved, Mr. Edmondson, counsel for the defendants, contended that the matter would have been amicably settled if the plaintiff had cared to disclose the name of his insurance company. If he had done so, it would have been paid, as it would have been settled between the two companies on their "knock-for-knock" agreement. Under this agreement, insurance companies paid half the total loss, and was a general agreement between companies in order to avoid expensive litigation.

Judge Moore decided that the plaintiff was entitled to bring his claim on his own behalf, and not through an insurance company, and gave judgment for him, with the question of fitting ball-bearings on to the whole of their costs.

A WISE DECISION.

FOR an alleged obstruction of the footpath whilst unloading goods from a motor lorry, Messrs. T. L. Robinson, Ltd., wine and spirit merchants, of Preston, were summoned at Preston. It was stated that in front of defendant's premises the footpath was obstructed by the unloading of a motor lorry to get past. The conveyor was 5 ft. 6 in. above the level footpath from the lorry to a platform inside the premises. Pedestrians had to leave the footpath and walk round the lorry to get past. The conveyor was 5 ft. 6 in. above the level of the pavement.

Mr. G. Ambler, who defended, pointed out that occupiers of premises were entitled to the reasonable use of the pavement in front of their premises for the loading and unloading of goods, and he quoted High Court decisions in support of this contention.

Mr. H. Fazackerley pointed out that these cases referred to the carrying of goods from vehicles across the pavement, and not, as in this instance, to an obstruction of the pavement by a fixed mechanical contrivance. The magistrates dismissed the summons as there was not sufficient evidence of unreasonable obstruction.

MOTOR COACH PROPRIETOR SUED.
MISTAKE OVER TIME FOR RETURN JOURNEY.

IN the Whitechapel County Court, before Judge Cluer, two actions were heard against a motor coach proprietor for alleged not picking up all the passengers, when returning from Ramsgate. The first action was by Miss Emily Free, of 10, Library Place, St. George's, E., the defendant being Mr. W. Padmore, of 18, Renforth Street, Bermondsey, S.E., motor coach proprietor, to recover £1 15s. 4d.

The plaintiff gave evidence, and said that she booked with a Mr. Colin, an agent in Commercial Road, E., to go to Ramsgate on August 3rd last. On arrival, the driver told the passengers that they should meet at the Victoria Garage, Ramsgate, at 4 o'clock the following Saturday, for the return journey. She was at the appointed place, with her friend, at 3.40, but the coach did not arrive, and she had to return by train. The return ticket on the coach cost 15s., but she had to pay 9s. 9d. for the single fare by rail, and also her fare from Victoria to Stepney.

Cross-examined by Mr. Padmore, she agreed that there were other passengers on the coach, but she did not know that 44 went down but only 38 returned. A friend of the plaintiff, who accompanied her, gave evidence that she heard the driver say they should be picked up at 4 o'clock.

Thomas Haines, the driver of the coach, said that when he got to Ramsgate he distinctly told all the passengers to be ready to return at 3 o'clock. As a fact, he was there with the other coach at 2.30, and 38 of the 44 passengers were on board by 3 o'clock, but he waited until 3.30 for the plaintiff and the other missing passengers without avail.

Judge Cluer said that the driver should have spoken more clearly when he was indicating the time they should return. The plaintiff was claiming for the expenses of her friend as well as herself, but that would have to be the subject of another action. He would allow the plaintiff 7s. 6d., half the value of the return coach ticket; 9s. 9d., the rail fare from Ramsgate to Victoria; and 5d., the fare from Victoria to Stepney, 17s. 8d. in all, and costs.

The second case was against the same defendant, the plaintiff being Sarah Enever, of 23, Brunton House, Commercial Road, E, a widow, and she claimed £3 10s. 8d., rail fares and expenses in returning from Ramsgate, with her three children; four 7s. 6d. tickets on the coach; four 9s. 9d. singles on the train, and four 5d. tickets from Victoria.

The plaintiff declared that she was told distinctly to return at 4 o'clock, and she was there 25 minutes early. She returned by train, and saw the driver later in the evening, and he said he was sorry if he had made a mistake.

Mr. Colin, the agent, for the defence, said that before the coaches started out, he went along with Mr. Padmore and told the passengers what time to return.

His Honour said that it was evident the defendant's driver had made a mistake, and gave judgment for the plaintiff for the amount claimed, with costs.

THREE INCHES TOO WIDE.

A FINE of £2 was imposed on the Rawtenstall Corporation by the Bury magistrates for using a bus, the width of which exceeded the regulation width of 7 ft. 6 ins. The Corporation's explanation was that the buses were originally fitted with solid tyres. These had been replaced with balloon tyres, and it became necessary to stretch out the mudguards, which gave an additional width of three inches.

CONSIGN SHIPMENTS FOR NORTHERN

INDIA

TO

THE EASTERN EXPRESS Co. LTD.

Forwarding, Shipping & Clearing Agents,

KARACHI

This Advertisement is inserted to bring before Forwarding Agents and Shippers in Great Britain and abroad the name of a Firm to whom shipments for any part of India should be consigned. Every description of merchandise cleared and forwarded to consignees. C.O.Ds. collected and remitted promptly.

Motor Notes.

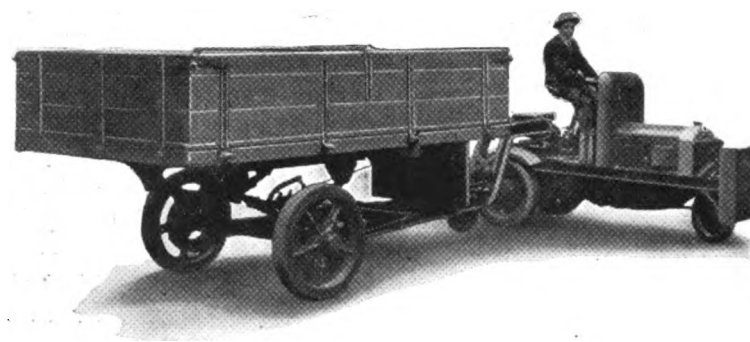
Hydraulic Jacks.—The Atlas Engineering Co., 23, Tavistock Square, London, W.C.1, send us catalogue sheets describing and illustrating their complete range of hydraulic jacks. With regard to the commercial vehicle jacks, the reservoir is brazed to the base, this being a special feature. These jacks are of great power, enabling the heaviest loaded vehicles to be dealt with, and they are built in a range of sizes to suit all makes of heavy vehicles. They are provided with Duplex pump, which ensure quicker and easier lift than other jacks, either round crutch discs or "V" crutch can be supplied. The former is for low axles. The commercial jacks are made in four sizes, namely:—No. 1, 9¼ in. closed, extending to 21¼ in. No. 2, 10½ in. closed, extending to 23¾ in. No. 3, 11¼ in. closed, extending to 25¼ in. No. 4, 12¾ in. closed, extending to 27¾ in.

THE ATLAS ENGINEERING CO'S. HYDRAULIC JACK.

Co-operative Beans. — The accompanying photograph shows part of a fleet of Bean commercial vehicles in service for the Worksop Co-operative Society, Ltd.

THE WORKSOP CO-OPERATIVE SOCIETY'S BEANS.

A New Millars' Tractor. — The Millars' Tructractor, manufactured by Millars' Machinery Co., Ltd., Pinners' Hall, Great Winchester Street, E.C.2, which is a general utility machine equipped with a platform or automatic dump body for use in industrial yards, such as foundries, docks and road work, is already well known, and the new Millars' Tractor is a unique variation of this vehicle. The frame is of the triangular girder type, and the springing is by coil springs and pneumatic suspension. The steering wheel is of the castor type, equipped with a solid rubber tyre, which together with the narrowness of the track (it is only 3 ft. 5½ in.), gives it a remarkably small turning radius. Power is provided by a four cylinder engine, 3⅛ in. bore and 4½ in. stroke, developing 16 b.h.p. It is fitted with an aero type impulse starter, a solex carburetter with air filter, and B.T.H. magneto, all being standard equipment. The drive is enclosed gear with a bevel differential. A three speed and reverse gear box is provided of the selective type with dry plate clutch. The engine is pressure lubricated, and the chassis is lubricated on Enots grease gun system throughout. The brakes are the internal expansion type capable of hauling a 5/6 ton load. The tractor is intended for hauling a two-wheel trailer of the swan neck pattern. Amongst users are Messrs. Greenall Whitley & Co., Ltd., of Warrington, and another well known brewery at Watford.



THE MILLARS' TRUCTRACTOR.

Car Collection Company's Birmingham Branch. — The Car Collection Company of 244 Edgware Road, London, W.2, specialists in the collection and delivery of commercial vehicles have, owing to the steady expansion of their business, opened an office under the management of Mr. E. R. Reid at 20 Herald Chambers, Martineau Street, Birmingham. Telephone: Central 7189. Telegrams: "Karkollect."

Order for Bristol Superbuses.—The West Riding Automobile Co., Ltd., of Wakefield, who already operate a fleet of 128 "Bristol" omnibuses, have recently placed an order with the Bristol Tramways & Carriage Co., Ltd., for a further fifteen "Bristol" 30-seater Superbuses.

"Guy" Activities.—Only a short time ago, Mr. F. J. Woodward, who had previously been Sales Manager of Guy Motors, Ltd., of Wolverhampton, took over the position of Director and General Manager of Guy Motors (South Africa), Ltd. Things are already beginning to move there, and the firm are shipping a number of Guy 30-cwt. chassis, 20-seater light passenger speed chassis, 32-seater 6-cylinder 4-wheeled bus chassis and 7-ton six-wheeler chassis. Public opinion appears to be favouring the use of trolley buses where trams have been or are at present being used, and from various parts of the country and on the Continent visitors come to Hastings and to Wolverhampton to see the Guy trolley buses in operation, and the company is getting a very fair share of the trolley bus business. It is some time now since the Wolverhampton Corporation scrapped their trams and replaced them with trolley and petrol buses, and Guy Motors have now received a further repeat order (17th repeat order) for their vehicles from the Wolverhampton Corporation—this time for five six-wheeled trolley bus chassis having front wheel brakes and axles offset to the nearside to give lower overall height of complete bus.

Manchester Orders New Omnibuses. — There was a somewhat lively meeting recently of the Manchester City Council who had before them a recommendation by the Tramways Committee that orders for ninety new omnibuses should be shared equally among Crossley Motors, Limited, Manchester; Leyland Motors, Limited, Leyland, Lancashire, and the Associated Equipment Company, Limited, London. As a result of the discussion the Council decided that the contract should be divided between Crossley Motors, Limited, and Leyland Motors, Limited, thus keeping the work in Lancashire.

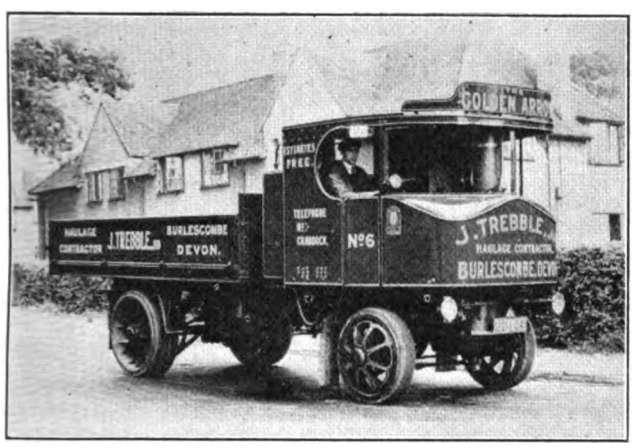
Karrier New Models.—Karrier Motors, Ltd., Karrier Works, Huddersfield, announce that the coming year will see the marketing by them of a new and comprehensive range of passenger vehicles, five in all, designed specifically for the rapid, sure and comfortable conveyance of from 20 to 68 people. The following descriptive names have been allocated to the new chassis:—Cutter, 20 seat four-wheeler; Coaster, 26 seat four-wheeler; Chaser, 32 seat four-wheeler; Clipper, 40 seat six-wheeler; and Consort, 68 seat six-wheeler. The 1930 goods carrying vehicles, whilst having been brought thoroughly up-to-date, will be on much similar lines to the present range of from 2 to 12 tons, but a new addition has been made to which attention will be drawn in due course. An example of this model to the order of a leading Railway Company will be exhibited on Stand 77 at Olympia.

Commer Car Orders.—Amongst various deliveries made by Commer Cars, Ltd., of Luton, during the last month, are the following:—Two 2½GN type (2½-ton chassis) for the Vacuum Oil Company. One 4GN type (4-ton chassis) a repeat order for the Glico Petroleum Co. Three 2½GN type (2½-ton chassis) for the Sheffield Corporation. One 5P chassis (for 20-seater omnibus body) a repeat order for G. L. Scott, Aberdeen. Two 3-ton covered lorries complete for Kolster Brandes Co., Ltd., Sidcup, and one 4GF (4-ton forward drive) complete lorry for Rice & Sons, Ltd., Stockwell.

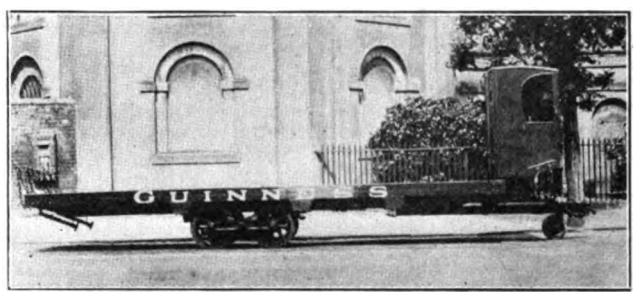
"Sentinel" Sales.—We are informed by the "Sentinel" Waggon Works, Ltd., of Shrewsbury, that they have recently received orders for their well-known double geared rigid frame six wheeler the "Sentinel" D.G.6. from the following:—The City Brick Co., Ltd., Birmingham; Ramsdell Brick Works; Crowder & Brown, Birmingham; A. J. Gupwell, Ltd., Birmingham (repeat order); F. W. Berk & Co., Ltd., London; Cliffords (Fulham), Ltd.; T. R. Sanders, Windsor (2) (repeat order); Lewis, Rugg & Co., London; C. Pace, London; Willment Bros., London (repeat order); F. Saunders, Woolwich; F. W. Wright, Tetbury, Glos. (repeat order); Blockley Brick and Tile Co., Blockley; Tarmac, Ltd., Wolverhampton (4) (repeat order); W. E. Edwards, Brixton; Newman and Masters, Lytchett Minster (2); A. D. Hayes, Ltd., B'ham; Marston, Thompson & Evershed (2); Jas. & Geo. H. Matthews, Ltd.; H. Kemp, Ltd., Doncaster; H. Thompson and Co., Ltd., Canada; Robertson & Sons, Catford; Cement Marketing Co., Ltd., London (repeat order); Wm. Lewis, Ltd., Bootle; Breedon & Cloud Hill Limeworks, Isley Walton (repeat order); Mansfields, Ltd., Eastbourne; Pearce Haulage Co., Ltd., Newport, Mon. (repeat order). During this same period the double geared four wheeled tipping and flat platform model has also been in demand and the following have placed orders:—Geo. Shaw & Co., Ltd., Leigh (repeat order); J. Washbourne & Son, Yate; E. J. Mylon, Hayes (repeat order); Hough & Whitmore, Gloucester; G. H. Wintle and Sons, Old Sodbury; R. Rowley & Co., Ltd., Leicester; J. & P. Zammitt, Llanelly; Tottenham & District Gas Light & Power Co., Ltd.; Fulton & Semple, Crosshouse; Wm. Elworthy, Tiverton (repeat order); The Premier Waterproof & Rubber Co., Ltd., Manhester (2); Hodgson's Kingston Brewery Co., Ltd.; H. S. Pledge & Sons, Ltd., Ashford; Young Bros., Riddrie (repeat order); John Methuen & Sons, Markinch. The "Super-Sentinel" too is still popular both at home and abroad, and the following have placed orders for this model:—J. Trebble, Junr., Burlescombe, Devonshire; The Griffin Engineering Co., Ltd., Jo'burg; Graham, Row & Co., Valparaiso, Chile (4).



A SENTINEL IN THE SERVICE OF J. TREBBLE, JUNIOR.

Saurer Representation in Lancashire and Cheshire.—The Saurer Commercial Vehicle Co., Ltd., of 21 Augustus Street, Albany Street, London, N.W.1, have recently concluded an agreement with J. Blake & Co., Ltd., of Liverpool and Manchester, whose name is so widely known throughout the motor trade, whereby they will be representing the Saurer Company in the counties of Lancashire and Cheshire. Messrs. Blakes have already been Saurer agents for the past four years in Liverpool and district. Messrs. Blakes have, both at Liverpool and Manchester, well equipped and spacious premises capable of dealing with quite extensive overhauls and repairs. In addition they will carry at both depots a demonstration chassis, and a stock of Saurer spares.

The Eagle Special 8-ton Trailer. — The Eagle 8-ton patent trailer shown in the photograph, is a new type recently supplied to Messrs, Guinness, of Dublin. It is fitted with four wheels in tandem, carried on a bogie. The yokes are carried off the main axle, which extends the full width of the chassis. By this method, the road shocks are halved, and at the same time distribute the load from two to four wheels, but the trailer has the same advantage as a two-wheel trailer for backing purposes. Messrs. Guinness operate a large fleet of Eagle 2-wheel trailers, working in conjunction with International tractors. All trailers are fitted with a cab in front, and have a body platform of 22 ft. 3 in. long by 7 ft. wide. The Eagle patent spring drawbar is included, and also a screw down castor wheel. During the first half of August last, the Eagle Engineering Co., Ltd., received orders for over one hundred trailers of their various models, 67 of which were for home and foreign railway companies, including 42 5-ton trailers for the G.W.R. Co. Amongst other orders are fleets of the firm's patent two-wheel trailers for Courtaulds, Ltd., Bleachers Association, and Imperial Chemical Industries, all repeat orders, and a fleet of Eagle patent 2-wheel house refuse trailers for Exeter.



THE EAGLE SPECIAL 8-TON TRAILER.

Guy 30-cwt. Vehicles for Newspaper Delivery Work.—Guy Motors, Ltd., of Wolverhampton, have received a further repeat order from the *Evening Standard* for twelve 30-cwt. vehicles. This is the fourth repeat order the firm have received from the *Evening Standard* and the second batch of twelve which Guy Motors, Ltd., have supplied to them. This newspaper fleet now includes 37 Guy vehicles. Guy Motors, Ltd., have received repeat orders for this type of vehicle from Harrods, Ltd., the British Petroleum Company, The Ever Ready Co., Ltd., Messrs. Chivers, of Cambridge, The Avon India Rubber Co., Ltd., and large quantities have been exported to Australia, New Zealand and South America. The Guy 30-cwt. lorry with hinged and detachable sides and tailboard 15 ins. high, inside platform measurements 8 ft. 6 in. by 6 ft., completely equipped and painted in standard colours—green, dark blue or grey, is priced at £420; the chassis price, completely equipped, is £348.

Halo and Mintex Friction Linings.—We have received from British Belting and Asbestos, Ltd., an interesting brochure describing the manufacture of their Halo and Mintex friction linings for automobile manufacturers. The brochure contains an alphabetical list of all chassis giving the dimensions and prices of Halo brake liners for each, and a similar list for Mintex brake liners and Scandinavia cone clutch liners and various other of the firm's products, such as woven fan belts, etc.

County Court Judgments.

The following returns from the Registry of County Courts' Judgments, Whitehall, have been received relating to judgments entered up in the respective County Courts of England and Wales. Publication does not imply inability to pay. Many judgments may have been settled between the parties or paid. Judgments settled otherwise than through the Court may appear unless "satisfaction" is entered up within twenty-one days from judgment or allocatur. Registered judgments are not necessarily for debts. They may be for damages or otherwise, they may relate to actions *bona fide* contested between the parties, or they may be against defendants, liable in a representative capacity, and not personally; but no distinction is made on the register. Judgments are not returned to registry if satisfied in Court books within twenty-one days.

Dissolutions of Partnership.

Charles Frederick Davis and Alexander Albert Davis, trading as C. & A. Davis, general carriers and contractors, 16 Dufferin Street, London, E.C.1. 1st August, 1929. All debts by Alexander Albert Davis, who will continue.

Frederick Charles Hawkes, Charles William Hawkes and Horace Clifford Hawkes, trading as F. Hawkes, 18 Goodman's Yard, Minories, London, and Dorset Street, Stepney, carman. 29th August, 1929.

The Bankruptcy Acts, 1914 and 1926.

Bankruptcy Proceedings.

George William Hayes, Cheam House, Park Lane, Macclesfield, Cheshire, haulage contractor. Receiving order and order of adjudication, July 31st. Public examination September 24th, at Macclesfield.

Thomas Allen Corbett, 20 Belper Road, Sheffield, Yorkshire, haulage contractor. Receiving order and order of adjudication, Aug 1st. Public examination October 3rd, at Sheffield.

Edward Phillips, 44 Lower Crown Street, Morriston, Swansea, Glamorganshire, haulier. Receiving order and order of adjudication, August 1st. Public examination October 11th, at Swansea.

Sydney Edward Temple, 75 Sheep Street, Northampton, haulage contractor, lately Rothersthorpe Road, Far Cotten, Northampton. Receiving order and order of adjudication, August 9th. Public examination October 4th, at Northampton.

James Moore, Rock Cottage, Georgenympton, Devonshire, lately general haulier. Receiving order, August 8th. Order of adjudication, August 13th. Public examination October 1st, at Barnstaple.

Walter Henry Pratley, Hill Crest, Westfield, Wyke, near Bradford, lately 60 New Road, Halifax, haulage contractor. Receiving order and order of adjudication, August 15th. Public examination October 4th, at Halifax.

Notices of Intended Dividend.

Ernest William Hudson, Kimberley House, Newtown, Pontefract, Yorkshire, formerly haulage contractor, etc. No. 13 of 1929. Claims to Basil Shaw Briggs, County Chambers, King Street, Wakefield, Official Receiver.

George Morgan, lately 7 Essex Terrace, Saktash, Cornwall, carrier. No. 5 of 1928. Claims to Alfred N. F. Goodman, 11 St. Aubyn Street, Devonport.

John Glaze Griffiths, 5 St. Alkmund's Place, Shrewsbury, Salop, haulage and removal contractor. No. 4 of 1929. Claims to Cyril John Pyke, 22 Swan Hill, Shrewsbury, Official Receiver.

James Richard Lamb, Talbot Garage, High Street, Settle, Yorkshire, haulage contractor. No. 26 of 1929. Claims to John Osborne Morris, 12 Duke Street, Bradford, Official Receiver.

Notices of Dividend.

John Henry Binns, Heights Lane, Eldwick, near Bingley, Yorkshire, haulage contractor. No. 33 of 1929. First and final of 3/7d. in the £, payable at the Official Receiver's Office, 12 Duke Street, Bradford.

Edward Thomas Bateman, The Common, Lingfield, Surrey, carman and contractor. No. 6 of 1925. First and final of 7/4d. in the £, payable at the Official Receiver's Office, 12a Marlborough Place, Brighton.

Cecil Emerson Yeatman, 22 Chapel Lane, Poole, Dorset, haulage contractor. No. 33 of 1928. First and final of 5¼d. in the £, payable at the Official Receiver's Office, Midland Bank Chambers, High Street, Southampton.

James Alfred Morbey, 3 Victoria Gardens, Victoria Avenue, Kingston-upon-Hull, haulage contractor. No. 14 of 1929. First and final of 3¼d. in the £, payable at the Official Receiver's Offices, 37 Scale Lane, Hull.

Arthur Victor Newman, 2 Dorset Villas, Dorchester Road, Weybridge, Surrey, cartage contractor, etc. No. 18 of 1928. First and final of 1/4d. in the £, payable at the Official Receiver's Office, 29 Russell Square, W.C.1.

Thomas Oswald Leefe, 46 Heathcroft, Hampstead, London, N.W., haulage contractor, lately trading as T. O. Leefe, 6a North End Road, Golders Green, Middlesex. No. 57 of 1929. First and final of 3/6d. in the £, payable at 14 St. Mary's Axe, London, E.C.3.

John Parry, Nant Carw, Meyllteyrn, Caernarvon, haulage contractor, etc. No. 2 of 1929. First and final of 1/4¼d. in the £, payable at the Official Receiver's Offices, St. Peter's Churchyard, The Cross, Chester.

New Companies.

British & Continental Transport, Ltd. (242,222).—Private Company. Registered September 9th. Capital £200 in £1 shares. Objects: To carry on the business of transport agents, general carriers, railway and forwarding agents, carmen, warehousemen, wharfingers, shipowners, etc. The directors are: W. Dalton, R. A. E. Somerville. Registered office: 31/33 High Holborn, W.C.1.

Rymers Air Lines, Ltd. (242,266).—Private Company. Registered September 11th. Capital £100 in £1 shares. Objects: To own, hire or control aeroplanes, flying boats or any known or future vehicles or devices of any kinds for the transportation of goods or passengers by air, to operate air line services, to provide garages, etc. The first directors (to number not less than 2 nor more than 5) are C. F. Rymer, Olive M. Williams. Registered office: 17 James Street, Liverpool.

Stepney Haulage, Ltd. (242,377).—Private Company. Registered Sept. 17th. Capital £1,000 in £1 shares. Objects: To carry on the business of haulage and general contractors, carmen, cartage contractors, proprietors of and dealers in motors and other accessories, etc. The first directors are not named.

H. Stone & Company, Ltd. (242,440). — Private Company. Registered September 20th. Capital £2,000 in £1 shares (1,000 ordinary and 1,000 deferred). Objects: To acquire the business of a contractor, haulier, coal merchant and builder carried on by H. Stone at Watchett, Somerset. The directors are: H. Stone (governing director), Mrs. Gertrude Stone. Secretary: Mrs. Gertrude Stone. Registered office: The Garage, St. Audries, Somerset.

Henry Green & Son (Haulage Contractors), Ltd. (242,490).—Private Company. Registered Sept. 23rd. Capital £5,000 in £1 shares. Objects: To acquire the business of a haulage contractor now carried on by H. Green at Rifle Street, Poplar, E. as "Henry Green and Son." The permanent directors are: H. Green (chairman), H. C. J. Green. Secretary: H. C. J. Green.

Associated Bus Companies, Limited. (242,532).—Private Company. Registered September 25th. Capital £20,000 in £1 shares. Objects: To acquire from the trustees of a deed dated July 1st, 1929, between the members of the Associated N. Staffs. Motor Bus Proprietors, of Hanley, Stoke-on-Trent, and their chairman and vice-chairman, the omnibuses, licences, real and personal property and goodwill acquired by them under the trusts of the said deed, to carry on the same, to apply for, acquire and carry on the business of licensed omnibus proprietors plying for hire, publicly and privately, and everything necessary for maintenance, including the building of garages; to purchase and sell spare parts, petrols, oils, greases and tyres, and hold agencies in connection therewith, etc. The first directors (to number not less than 2 nor more than 5) are: J. G. Leese, S. Hill. Secretary: H. Jones. Registered office: 69 Piccadilly, Hanley, Stoke-on-Trent.

Banks Bros., Ltd. (242,536). — Private Company. Registered September 26th. Capital £1,000 in £1 shares. Objects: To acquire the business of carting agents and fish and poultry dealers heretofore carried on by A. Banks, J. W. Banks and R. Banks, or either of them, at 144 and 263 Holderness Road and 68 Cleveland Street, Hull. The directors are: A. Banks, J. M. Banks, R. Banks (all permanent, subject to each holding 100 shares). Secretary: C. C. Holmes. Registered office: 144 Holderness Road, Hull.

J. Stevens (Transport), Ltd. (242,579).—Private Company. Registered September 27th. Capital £100 in £1 shares. Objects: To carry on the business of general carriers, railway and forwarding agents, warehousemen, bonded and general carmen, cartage contractors, garage proprietors, etc. The first directors are to be appointed by the subscribers. Registered office: 7/9 New Road, Woolwich, S.E.18.

Wright Bros. (Removals), Ltd. (242,635). — Private Company. Registered September 30th. Capital £1,000 in £1 shares. Objects: To acquire lands and buildings in London and elsewhere, to erect and maintain warehouses, offices, stables, garages, and any other buildings, to carry on the business of storers, warehousers, packers, removers and exhibitors of furniture, pictures, plate, musical instruments, wine and other consumable and perishable goods, carriages and other vehicles, etc. The directors are: S. W. Bishop, A. W. Bishop, H. V. Bishop. Registered office: 10 and 12 Belgrave Road, S.W.1.

A. Turner & Sons (London), Ltd. (242,636).—Private Company. Registered September 30th. Capital £1,000 in £1 shares. Objects: To acquire the business now carried on at Windsor House, Victoria Street, S.W., as "Arthur Turner," and to carry on the business of International freight forwarders, ship and insurance brokers and shipping agents, etc. The permanent directors are: A. J. Turner, Mabel Turner.

Seller Bros. (Hinckley), Ltd. (242,647).—Private Company. Registered September 30th. Capital £500 in £1 shares. Objects: To acquire the business of haulage and general contractors, garage proprietors, funeral furnishers and undertakers, etc., carried on by C. Seller and G. Seller at 55 Coventry Road, Hinckley, as "G. Seller and Co." The directors are: C. Seller, G. Seller. Secretary: A. J. Jenkins.

Herbert Transport, Ltd. (242,641).—Private Company. Registered September 30th. Capital £100 in £1 shares. Objects: To carry on the business of carmen, carriers, haulage contractors, warehousemen, wharfingers, general carriers, etc. The permanent directors are: J. W. Sims, H. H. Herbert.

Simpsons & Forresters, Ltd.—Registered in Edinburgh as a "private" company on October 1st, with a nominal capital of £100,000 in £1 shares. The objects are to carry on transport services for passengers and goods by motor omnibus, char-a-banc, car and other vehicles, etc. The directors are: F. Simpson, R. Forrester, W. J. Thomson, W. Alexander, Senr., W. Alexander, Jnr. The registered office is at 7 Market Street, Dunfermline. The file number is 15,716.

R. V. Morris, Ltd. (242,671). — Private Company. Registered October 1st. Capital £7,000 in £1 shares. Objects: To carry on the business of road transport contractors, common carriers, forwarding agents and warehousemen, etc. The directors are: R. V. Morris, A. F. Morris. Registered office: Hainault, Chadwell Heath Lane, Chadwell Heath, Essex.

Acme Pullman Services, Ltd. (242,710).—Private Company. Registered October 3rd. Capital £700 in £1 shares. Objects: To carry on the business of motor coach, cab, car, omnibus and van proprietors, motor garage proprietors, etc. The directors are: F. G. Smith, Mrs. C. B. Smith, G. Dudley. Secretary: C. B. Smith. Registered office: 3 Norton Folgate, E.1.

J. G. Rawlins, Ltd. (242,742). — Private Company. Registered October 4th. Capital £500 in £1 shares. Objects: To carry on the business of haulage contractors and road material specialists, dealers in building and road materials, and motor engineers, and to develop and turn to account the business formerly carried on by J. G. Rawlins at Alpha Yard, Alpha Place North, Kilburn. The directors are: J. G. Rawlins (chairman and permanent director), R. H. Kerswill, A. Kerswill. Secretary: A. Kerswill. Registered office: Alpha Yard, Alpha Place North, Kilburn.

Llanelly Steam Haulage Co., Ltd. (242,783).—Private Company. Registered October 5th. Capital £2,000 in £1 shares. Objects: To carry on the business of haulage and transport contractors, hauliers, and general carriers of goods and passengers, garage proprietors, motor repairers and dealers, dealers in waste metals, timber and other waste materials, etc. The first directors are to be appointed by the subscribers. Secretary: M. V. Drew. Registered office: The Copperworks, Llanelly.

W. Wakley and Sons, Ltd. (242,791).—Private Company. Registered October 5th. Capital £6,000 in £1 shares. Objects: To adopt an agreement with W. W. Wakley, R. Wakley, N. Wakley and A. Wakley, trading as W. Wakley and Sons, Ltd., and to carry on the business of motor engineers and char-a-banc proprietors carried on by the above at Northop, Flint. The first directors (to number not less than 2 nor more than 7) are: W. W. Wakley (governing director and chairman), R. Wakley, N. Wakley, A. Wakley (All permanent). Secretary: W. W. Wakley. Registered office: Fron Haul, Northop, Flint.

Mortgages, Charges and Satisfactions.

Great Central Motor Service, Ltd.—Land Registration charge on freehold premises, No. 2 Wyndham Street, Marylebone Road, N.W. dated August 23rd, 1929, to secure all moneys due or to become due from the company to Midland Bank, Ltd.

Parks of Portsmouth, Ltd.—Charge on 2, 3, 4 and 5 Whitecloud Place, Highland Road, Southsea, dated Sept.

19th, 1929, to secure £600. Holder: Miss Eva H. Butterworth, Belvedere, All Saints Road, Scarborough.

J. Stevens (Transport), Ltd.—Debenture dated Sept. 30th, 1929, to secure £2,500, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: J. Stevens, O. G. Stevens and W. J. Stevens, carrying on business in co-partnership as J. Stevens at 7/9 new Road, Woolwich, S.E.18.

St. George's Wharfage and Transport Company (1925), Ltd.—Satisfaction in full on July 30th, 1929, of debenture dated March 30th, 1928, securing £12,000.

Pearl Grey Coaches, Ltd. — Satisfaction in full on August 30th, 1929, of mortgage dated March 24th, 1924, securing all moneys due or to become due.

Receiverships (Appointment or Release).

J. T. Jefferson & Sons (Featherstone), Ltd. — H. Holmes, Incorporated Accountant Auditor, of 45 Ropergate, Pontefract, ceased to act as Receiver or Manager on July 26th, 1929.

Emery & Partners, Ltd. — S. T. Evans, of 6 Mount Stuart Square, Cardiff, ceased to act as Receiver or Manager on August 31st, 1929.

George Bury (Sheffield), Ltd.—P. Toothill, of 9 and 11 Figtree Lane, Sheffield, ceased to act as Receiver or Manager on September 12, 1929.

Irish Bus Owners' Association.

A meeting of the Irish Bus Owners' Association was held in Dublin on September 18th, at which Major J. H. de W. Waller, D.S.O., presided.

In the course of an address, Major Waller said that it must be a matter of great satisfaction to all present to know that the Association had steadily gained in strength and influence since it was started a year ago. The industry as a whole had entered a period of transition—legislation was in the air. The great general public, whom it was their privilege to serve, would, he believed, welcome fair play to the independent owners who had, by their energy and courage, developed an entirely new field of passenger transport, thereby adding considerably to the labour fund, and increasing facilities for, and reducing the cost of, travel. Their members were unquestionably the creators of this new business, and he felt confident that, if they continued to press their case moderately and consistently, neither the Government nor the public would listen to any would-be monopolists who sought to oust them from the inheritance of their fair share of the business. The independent owners desire to see better traffic conditions on our streets. They would welcome and heartily support the efforts of the authorities in introducing legislation which would make for the elimination of waste, and the improvement of our street transport services, and they would gladly confer with others engaged in the industry to secure this end.

The situation arising out of recent legislation, and out of the Court of Inquiry into the causes and circumstances of the Dublin tramways strike, having been fully discussed by the meeting, a resolution, as follows, was adopted unanimously:—"That this representative meeting of the omnibus owners and operators in the Irish Free State tenders its best thanks to the Special Committee of the Irish Bus Owners' Association, who stated the case of independent owners to the Court of Inquiry into the causes and circumstances of the Dublin tramways strike, and resolves to recommend all independent owners of road passenger vehicles in the Free State to support the Association in pressing for some form of transport control in the Greater Dublin area and elsewhere in the Free State, which will have due regard (a) to the preservation of the interests of agencies whose enterprise has provided essential public facilities in the face of the opposition of railway and tramway monopolies, and (b) which will ensure the future development and maintenance of such services upon a basis which is equitable to all parties now concerned in the operation of passenger transport services."

Having discussed the reference of the Court of Inquiry to the alleged failure of the Tramways Company and the Bus Owners' Association to make representations during 1928 to the Government on the subject of excessive competition, the following further resolution was unanimously adopted:—"That this meeting, representative of the independent operators of omnibus services in the Irish Free State, desires to place on record that the members and supporters of the Irish Bus Owners' Association are agreeable to take such steps as may be necessary to give effect to the recommendations of the report of the Court of Inquiry in so far as they refer to the elimination of wasteful competition, and to enter into suitable conferences with other responsible parties to that end."

Owing to the departure from Ireland of Mr. F. T. Wood, late managing director of the Irish Omnibus Co., Major Waller was elected President; Mr. H. M. S. Catherwood, and Mr. Eugene Lacey, Vice-Presidents, and Mr. Eoin O'Keeffe, as Chairman of the Association.

The American Car in Other Countries.

Mr. Alfred Reeves, General Manager of National Automobile Chamber of Commerce of the U.S., believes that the foreign market, in which the U.S. manufacturers have been highly interested for a number of years, is producing wonderful results and that sales to other countries, which for the current year are estimated to exceed 1,000,000 U.S. cars, will present another achievement in the history of the American Automobile Industry. In addition, all this may be considered as an indication of what can be done in the future by automobile manufacturers.

The situation here and abroad, Mr. Reeves said, is comparable with that in the U.S. nine years ago. The number of cars registered in other countries exceeds 7,250,000, compared with 7,565,000 which were registered in the U.S. as of January 1st, 1920. Export sales during the present year will exceed 1,000,000 cars of U.S. design. Besides this, manufacturers of other countries will do considerable business. Our exports during the first three months were one-fifth of the total production. The fact is that, apart from sales of American designed cars there is additional production abroad, which brings the total foreign absorption to about 1,750,000 cars a year. This is a very favourable trend. As this tendency continually increases, the prospects for the American car in foreign countries for the coming years seem to be most promising.

Buses in South Shields.—At the Watch Committee of the South Shields Corporation, the Chamber of Trade forwarded a resolution protesting against the Corporation restricting the running of private buses into South Shields from outside areas. The town clerk stated that he had replied that the conditions formulated by the Corporation do not prevent buses from running into South Shields from outside districts either on the Sunderland, Bolton or Jarrow-Newcastle routes.

NOTICES

The World's Carriers is published monthly, on the 15th of each month. Annual Subscription, including World's Carriers Year Book and Diary, £1 1s., post free.

Commercial Motor Transport.

The exhibition of Commercial motor vehicles now open marks a further step in the development of road transport, and affords an opportunity to inspect new vehicles of very great importance to all engaged in transport, whether by road or rail. This point was emphasised by Mr. H. L. Thornhill, of the London, Midland and Scottish Railway, in proposing the toast of the Commercial Vehicle Industry and the Exhibition at the luncheon on Friday last, following the important conference on Railway Road Transport. Two years ago, at the last exhibition of this kind, views were expressed that the industry had reached a pitch of perfection in economical and efficient engineering and comfortable and even luxurious body work, which left very little room for improvement. A visit to the present exhibition, however, shows that in no industry is it possible to stand still, and very big improvements have been made and new types of vehicles have been designed which will still further increase the efficiency and economy of transport by road. At the inaugural luncheon, reported in this issue, the Minister of Transport made an important and interesting speech which should be read and studied. Mr. Morrison has steadily enhanced his reputation, not only as an after-dinner and after-lunch speaker, but as a politician who takes his duties seriously and who is genuinely concerned for the wellbeing of transport in general over which he is the Government head. He did not hesitate, therefore, to speak out boldly on one or two points, where he considered a friendly warning should be given or where he thought that motor manufacturers and users of transport vehicles could make changes for the better. He has, moreover, a very human touch which enables him to say frankly what he thinks without giving offence, and in the short time during which he has held his important office he has made many friends entirely outside the party of which he is a prominent member. For instance, he referred to the statements which have appeared in the press recently that vehicles were being designed and manufactured capable of attaining a speed of 60 or 70 miles per hour, and he gave the industry what he called a private tip that they should not waste their money on such productions as they would certainly not be allowed to travel at anything like these speeds on the roads. Another point which he made was that the use of steel tyres, now a rapidly diminishing quantity, should be entirely discontinued, emphasising the damage to road surfaces which were made for the use of fast motor vehicles. The Commercial Motor Transport Exhibition, almost coinciding as it does with the publication of the second Report of the Royal Commission on Transport, dealing with the licensing and regulation of passenger motor vehicles, emphasises the need for the long overdue legislation in bringing up to date the laws governing this form of transport. Progress is so rapid, almost more rapid than the speed at which motor vehicles travel to-day, that if legislation is not carried into effect with all speed after the recommendations of any Commission or Committee, such recommendations tend to become obsolete before effect is given to them. It was, therefore, with very much interest that we heard the reference of the Minister of Transport, in his speech at the Annual Banquet of the Society of Motor Manufacturers and Traders, before the opening of the Motor Show for private or what are called pleasure vehicles, to the effect that he hoped to introduce, and with general goodwill, pass a Road Traffic Bill in the present Session of Parliament. Whatever may be the differences of opinion in detail on the recommendation of the Royal Commission upon which the new Bill will be passed, there is a general consensus of opinion that nothing can be worse than to leave the situation in its present out-of-date position. A feature of the Commercial Motor Transport Exhibition which has steadily grown in importance, and for which the Society of Motor Manufacturers and Traders deserve hearty congratulations, is the series of important conferences being held throughout the exhibition on various phases of road transport. We go to press immediately after the first important

Digitized by Google

Conference, that with the Railway Companies, and this is being followed by other Conferences throughout the week, which will all help to give motor manufacturers a better idea of the requirements of their customers and enable them to make such improvements or alterations or to make suggestions to the user which will facilitate the increased use of motor vehicles both for passengers and goods of all kinds and amongst all trades. This is, we are convinced, a most important work and one which not only brings to the exhibition the leading members of such industries but also helps them to get together and to voice their requirements and to hear what the manufacturer has to say in reply.

Comment on Current Topics.

The Licensing and Regulation of Public Service Vehicles.

The Royal Commission on Transport has issued its second report, which deals with the licensing and regulation of public service vehicles. A synopsis of the report appears on other pages of this issue. The recommendations contained therein are of a far reaching and important nature and should be considered most carefully by all those interested. The remarkable development of the public service vehicle industry has brought in its trail a whole host of problems requiring solution. It is admitted on all sides that the Law or rather Laws framed for the regulation of such transport, now in operation, are inadequate and confusing. Furthermore, the issuing of licences to, and the control of the operation of such vehicles is largely in the hand of those who themselves are interested in services either directly or indirectly. Whether applicants for licences are on occasion refused such licences because of the competition the recipients of the licences would create with services in which the licensing authorities are interested, may or may not be the case, but at the same time it is a fact that there have been very many disputes and much ill feeling caused on this assumption in every part of the country. It is one thing, however, to realise that new legislation is necessary and quite another matter to frame it in such a manner that it shall meet with the approval of all concerned. Whilst recognising the necessity for new regulations owing to the present inadequate and unsatisfactory control, we also recognise that there is danger in the possibility of establishing over control. Over control must be resisted by every legitimate means, as it would mean stagnation in development. Whether or not the recommendations of the Royal Commission would result in too rigid control we are not prepared to express an opinion upon, but we suggest that they require most careful consideration in that respect. It is suggested that England and Wales should be divided into ten traffic areas and Scotland into four, and that in each of these areas three Commissioners, appointed by the Minister of Transport, should be the sole licensing authorities, but at the same time powers would be given to existing licensing authorities and to all County Councils to make regulations regarding the routes, stands and stopping places of public service vehicles. The Commissioners, it is suggested, shall have time-tables of all regular services submitted to them and shall satisfy themselves that such time-tables are so arranged as to provide the public with adequate facilities at all convenient hours and in such a manner that the legal maximum speed limit for the vehicles used will not be exceeded. Whether this would constitute a hardship or not is dependent upon the maximum speed limit fixed. The retention of a speed limit for public service vehicles and at the same time the abolition of the speed limit in respect to private vehicles will not harmonise if put into effect, as the result would be the slow moving public service vehicle would block the carriageway and road congestion, cutting in and other undesirable conditions, would increase the danger of the road instead of making it more safe. The powers it is proposed to give to existing licensing authorities and to County Councils to make regulations regarding routes, stands and stopping places would, we imagine, enable these local authorities to obstruct competition with their own services to just as great an extent as they are enabled to do by their present powers. It must be remembered that the object of these proposed new regulations is to protect the public, that is to say to give them good service at reasonable fares, and each proposed regulation should be examined from that point of view. The waste of money owing to unrestricted competition is an argument in favour of control which has perhaps been overdone. The patrons of these services want to travel from one point to another with the least inconvenience and delay. They are not concerned in monetary losses due to competition; they would rather have over competition than under competition, as the latter must inevitably result in inferior service. Further recommendations of the Commission include certificates of fitness of vehicles which theoretically are desirable, and no doubt the obligatory insurance is not only desirable but absolutely necessary. The Royal Commission certainly could not have made a less biased report, and though we doubt the practicability and the possibility of the smooth working of some of the recommendations if put into effect, we do so with a thorough appreciation of the difficulties to be encountered.

The Future of Canals.

The Royal Commission on Transport, having issued their second report, are now busily engaged in hearing evidence on the third section of their inquiry, namely, that concerning the general co-ordination and development of all available means of transport. In this connection some interesting evidence was given by Mr. R. Fane de Salis, President of the Canal Association, whose article appearing in our last issue, aroused considerable interest. Mr. de Salis submitted a memorandum on behalf of his Association suggesting means for making inland waterways more effective for transport purposes. It was shown that there were 932 miles of waterways in England and Wales owned by Railway Companies, 1,543 miles owned by 31 other companies (not including the Manchester Ship Canal), and 1,141 miles of navigable rivers and drainage areas chiefly controlled by 51 public bodies. The traffic in 1927 of railway owned canals was 2,539,710 tons, and on the canals and rivers of the 31 other companies it was 20,024,934 tons. Mr. de Salis, on behalf of his Association agreed that the first essential of progress was unification of ownership, but in answer to a question he voiced the opinion that an effective and efficient system of canals was only possible in certain parts of the country naming the Birmingham and Midland routes, where he considered the canals would repay considerable expenditure. In any scheme for the co-ordination of all forms of transport the canals and inland waterways must necessarily be taken into consideration, and with the many conflicting opinions as to the possibility of improving our canal

Digitized by Google

system, any information on this subject is of considerable importance. We believe the Canal Association would do good work by making public all the facts they have at their disposal, to enable not only the Government, but those interested in transport, to arrive at a clearer understanding of the prospects and possibilities of re-suscitating the canals of this country and making them more efficient as a living and active part of transport.

Suggested Nationalisation of Transport.

The debate in the House of Commons on Wednesday, November 6th, when a resolution in favour of the nationalisation of railways and long distance road transport was discussed, shows the extreme necessity for the careful handling of the co-ordination of transport which is now proceeding. Judging from the experience of other countries, it would be a bad day for Great Britain if transport of all kinds were nationalised, adding still further to the bureaucratic administration under which we are suffering so seriously in other directions. At the same time it is difficult to see where the line can be drawn, in view of the fact that all the deliberations now taking place are with a view to eliminating competition, restricting the rights of the individual and bringing under public control those services which have hitherto been carried out by private enterprise under more or less free conditions. The resolution, after being discussed, and an amendment opposing it having been defeated, was adjourned, but the Minister of Transport, in replying to the debate, said that the Government supported broadly the principle of the resolution, which was in keeping with the general policy of the Labour Party. We do not agree with his statement that there could be no question that the building up of a transport system on the basis of free competition had been injurious to the efficiency of the public service of that industry. We should never have reached the present advanced state of transport development, but for that free competition which he seemed to deplore. At the same time he stated that it would be improper if he led the House to believe that the resolution would be followed immediately by a Bill for the nationalisation of railways, but if this were done it would want to take over the long distance road transport as well. The debate is one which it is well to keep in mind so that those who are keenly interested in co-ordinating all forms of transport may have in their minds the danger of becoming so controlled that the further step of nationalisation may become inevitable.

Progress of Civil Aviation.

When we went to press last month, we were able to report at first hand, after inspection, the completion of R101, and were much impressed with the magnificent engineering feat which had produced this gigantic airship on experimental lines and using a fuel which had not hitherto been adopted for such a purpose. Just at that time an astounding attack was made on this vessel and her sister airship the R100, just nearing completion at Howden, Yorks, the attack coming from no less a source than Commander Sir Denis Burney, the head of the Airship Guarantee Company, to whom the Government had entrusted the building of the latter vessel. Let it be granted that the two ships were experiments on a large scale and that an immense sum of money had been spent upon them, that is immense comparatively because even the sum of £2,000,000 is small in comparison with the cost of a modern war vessel, yet unless we were prepared to scrap all our previous work in connection with lighter-than-air ships and leave the field to other countries, we must go on experimenting, and therefore spending money. It is now almost ancient history that the R101 made a very successful appearance from the huge shed in which we saw her and has carried out trial flights increasing in extent and radius and speed with great success. It is yet too early to say whether she will be anything but a fine weather vessel, and whether it means that during the stormy winter days she will be kept a prisoner in her shed, or what arrangements can be made to afford her protection while at the mast head to prevent her becoming a prisoner until better weather conditions come in the ordinary course of the seasons. It is sufficient for the present to say that the use of diesel engines using crude oil has been more than justified; that in other respects the vessel has fulfilled so far all the anticipations of her designers and of those in control. The report of the Air Ministry on the progress of civil aviation recently issued gives some interesting information as to the development of this form of transport during 1928. The amount provided for expenditure in connection with air transport for the year 1928-29, was £415,000, as against a sum of £1,755,400 spent by France, £2,585,020 by Germany, and £535,550 by Italy. It is interesting to note that the number of passengers carried by British airplanes was 29,300 this comparing with 113,645 carried by German machines, the latter country being first while Britain comes second, although very much behind the leader. The figures given relating to comparative mileages are also interesting, Germany coming first with 18,000 miles, France second with 12,570 miles, the United States third with 10,932 miles, Russia fourth with 88,690 miles, Italy fifth with 7,000 miles, Belgium sixth with 2,511 miles, and this country seventh with 2,215 miles. Up to quite recently the accident average was exceedingly low, but unfortunately just recently several disasters have overtaken British airplanes which have materially altered the figures.

The Appeal of *The World's Carriers*.

Having taken the liberty of talking about ourselves in our Twenty-fifth Anniversary Number we apologise for making a further reference to *The World's Carriers* before settling down to what we hope will prove another quarter of a century of useful work in the service of Transport. We have received many congratulations, both on the last issue of this journal and also on our completion of twenty-five years' work, in addition to those which we published in the October number. We also have to thank some of our colleagues of the press who have been good enough to write appreciative notices of this special issue. One of our contemporaries, in referring to this event, mentioned that this journal makes its appeal to Furniture Warehousemen & Removers and to Cartage Contractors. This is true, and we should be ungrateful if we did not recognise with deep appreciation the position which *The World's Carriers* has occupied in connection with these two very important branches of transport for so long a period, but the appeal which this journal makes is a very much wider one than this. It appeals to everyone who is interested in, and actively concerned with, Transport, irrespective of the branch to which he is attached. We mention this because our contemporary is not qualified to speak with authority on what is, or is not, the appeal which this journal makes. *The World's Carriers* is not a motor paper, nor is it a railway or a shipping journal, but it is a Transport paper, and as such, deals with transport of every kind in its columns month by month. Sir Josiah Stamp, in his address to the Graduate and Student Society of the Institute of Transport, emphasised the need for a broad and comprehensive view of transport as the greatest need of the present and of the future and this view is elaborated in his presidential address, reported in this issue. It is as a journal collecting and publishing information and giving news and articles on every form of transport, that *The World's Carriers* has taken its stand for the past twenty-five years—a stand which it proposes to continue during the years that are to come.

Personal Notes.

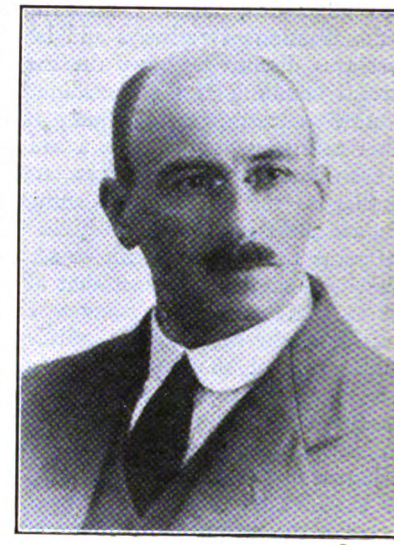
Motor Trade Institute's New President. — Mr. H. L. Kenward, Sales Manager of the Dunlop Rubber Company, has been elected President of the Institute of the Motor Trade for the current year, and Sir Herbert Austin, Sir George Beharrell, Mr. F. S. Bennett, Earl Howe, Mr. George Lucas and Sir Edward Manville have been re-elected Vice-Presidents.

MR. H. L. KENWARD.

New Sheriff for Norwich.—We offer our congratulations to Mr. Charles Frederick Watling, of All Saints' Green, Norwich, the head of the well-known organisation of C. Watling, Ltd., general carriers and removel and haulage contractors, of Westlegate, Norwich, with branches at Yarmouth and Lowestoft, upon his election as Sheriff of Norwich for the coming year. Mr. Watling, like most busy men, has found time for a great deal of public work in the City in which he was born and in which he has spent the whole of his life. Since 1922 he has been a member of the City Council, he is a prominent Rotarian and a member of the Institute of Transport.

MR. CHARLES F. WATLING, M.INST.T.

Aldershot and District Traction Company. General Manager.—Mr. J. B. Parker, M.I.A.E., M.Inst.T., General Manager and Engineer, Tees-side Railless Traction Board, has been appointed General Manager to the Aldershot and District Traction Company. Mr. Parker, who commenced his training in 1898, rose to the position of manager and in 1907 obtained an appointment with the Sheffield Corporation Tramways and Motors and was in their service for 13 years, rising to the position of Assistant Engineer and Superintendent. In 1920 he obtained the post of General Manager and Engineer to the Tees-side Railless Traction Board, and remained in their service until his appointment as General Manager to the Aldershot and District Traction Company. Mr. Parker is a Member of the Institution of Automobile Engineers, and also a Member of the Institute of Transport.



MR. J. B. PARKER, M.I.A.E., M.INST.T.

CAPTAIN CLEMENT JACKSON, M.C., M.I.A.E., A.M.INST.T.

Plymouth Transport Appointment. — Plymouth Corporation Tramways and Transport Committee have appointed Captain Clement Jackson, M.C., M.I.A.E., A.M.Inst.T., manager of the city's transport undertaking, in succession to Mr. H. P. Stokes, who has been appointed general manager of United Automobile Services, Ltd. Capt. Jackson was indentured to Sheffield Corporation tramways and motor department in 1909, and ultimately became assistant engineer of the tramways, operating over 350 cars. As motor omnibus superintendent, he was responsible for the operation and maintenance of the entire bus fleet. In June, 1922, he was appointed general manager and engineer of the Keighley Corporation tramways, and in May, 1925, went to Oldham, succeeding Mr. W. Chamberlain, who became tramways manager to the Belfast Corporation. Capt. Jackson has full experience of Parliamentary work, including the preparation of and giving evidence in connection with local Acts and Ministry of Transport inquiries.

MR. W. M. CAMPBELL, A.M.INST.T.

Blackpool Transport Appointment. —Mr. W. M. Campbell, A. M. Inst. T., Edinburgh Corporation Transport Department Motor Bus Superintendent, who has been appointed Traffic Superintendent to the Blackpool Corporation, received his early training in the clerical branch of the Edinburgh & District Tramways Coy., Ltd. Subsequently he became Ticket and Traffic Inspector to be followed by appointment as Night Superintendent in charge of all tram car depots and two garages and has been the Edinburgh City Motor Car Superintendent, since 1921, when the fleet of Corporation Motor Cars was "pooled," and Motor Superintendent, Edinburgh Corporation Transport Department, since 1923, in control of all

Digitized by Google

motor bus, motor car, and motor lorry services. Mr. Campbell is an Associate Member of the Institute of Transport, and holds the rank of Captain in the Supplementary Reserve of Officers, Royal Army Service Corps.

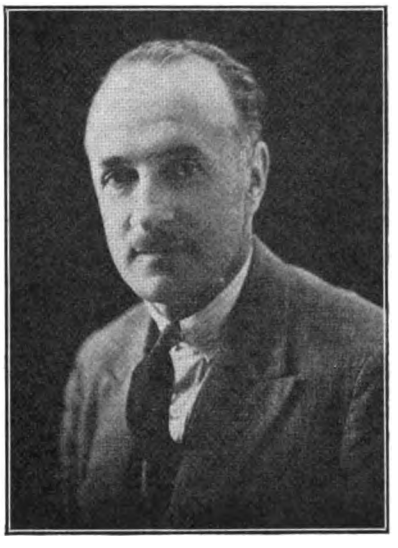
A.E.C. New Managing Director. — Mr. C. W. Reeve, who has recently been acting as Assistant to the Chairman of the Associated Equipment Company, Southall, Middlesex, has been elected to the Board and appointed Managing Director of the Company. Mr. Reeve has been associated with the A.E.C. since March, 1915, when he joined that Company as Works Accountant. The following year he became Accountant, and two years later, Joint Manager. His next appointment was that of Chief Purchasing and Stores Superintendent to the Underground Group of Companies. This position he held from 1924 to 1928. Mr. Reeve was a member of the Council of the M.T.A. from 1920-1923, and was President of that body in 1922-1923. He was on the Council of the Society of Motor Manufacturers and Traders from 1920-1924.

Mr. W. H. Keys joins the Vulcan Organisation. — Mr. W. H. Keys has recently joined the Vulcan Motor and Engineering Co. (1906), Ltd., Crossens, Southport, and has taken charge of the firm's municipal sales. He will be pleased to meet and hear from all old friends at his London address, Blackfriars House, 19 New Bridge Street, London, E.C.4.

Association of Passenger Traffic Officers.—New President.—Mr. H. H. Melanson, General Passenger Traffic Manager of the Canadian National Railways, was recently elected President of the "Association of Passenger Traffic Officers," at their annual convention, Winnipeg. This is the second occasion on which a Canadian has been so honoured, the only other Canadian holder of this office being George T. Bell, Executive Assistant to the Vice-President in Charge of Traffic of the Canadian National Railways.

Mr. George Pate, B.Sc., to join Albion Motor Car Co., Ltd.—Mr. George Pate, B.Sc., late Chief Engineer and Director of Messrs. D. Napier & Son, Ltd., Acton, the well-known Aero Engine Manufacturers, is joining the Albion Motor Car Co., Ltd. at their Headquarters at Glasgow, at an early date, and will take his seat on the Board as a Director. It is of interest to note that previous to going to Messrs. Napier, Mr. Pate was on the staff of the Albion Company for a number of years.

MR. C. W. REEVE.



MR. W. H. KEYS.

MR. H. H. MELANSON.

Obituary.

Harry Woodifield Capper.

It is with deep regret that we record the death, on October 21st, of Mr. H. W. Capper, Under-Sheriff of the City of London. Mr. Capper was Clerk to the Cripplegate Charities, and his death means a great loss to his many friends and to the institutions with which he was so closely associated. Only a few can appreciate fully his devoted service to Cripplegate, and the Cripplegate Institute, the welfare of which was so close to his heart, has lost a beloved friend and guide.

As Clerk of the Worshipful Company of Carmen, Mr. Capper was a tireless and enthusiastic worker. Elected to the position over thirty years ago, he transformed a somewhat moribund guild into a live force in the City, a force that to-day plays a very active part in connection with the carrying trades of London. Replying to the toast of his health, proposed at a dinner of the Carmen's Livery as recently as April last, Mr. Capper said, "I am delighted that I have in a humble way been able to help the progress of the Worshipful Company of Carmen; but we are only at the beginning, as the Company intends to be second to none among the minor Companies of the City; I am just as keen and enthusiastic for the well-being and advancement of the Carmen's Company as I was when you elected me thirty-one years ago."

Deep indeed is the regret felt at the passing of Harry Woodifield Capper, the friend of all with whom he came in contact.

At the funeral at Golders Green and at a memorial service at the Church of St. Giles, Cripplegate, there gathered many Aldermen of the City, members of the Court of Common Council and friends of the Under-Sheriff.

R.A.C. Expansion.—Since the beginning of this year, the Associates, Touring, Road Guides and Engineers' Departments of the Royal Automobile Club, have all been largely expanded in order to deal with the increase of work occasioned by the rapidly growing membership of the Club. In addition, a new Provincial Office has been opened in Edinburgh, the Newcastle Office has removed to more commodious premises, and arrangements are now being made to extend considerably the accommodation at Birmingham and Bournemouth offices.

Motor Lorries—Salonica. — The Commercial Secretary at Athens (Mr. W. F. Vaughan Scott), reports that a local transport company is desirous of receiving particulars of British motor lorries of 2 or 3 tons capacity, and also for steam wagons fitted to burn crude oil or lignite. Firms desirous of offering British-built vehicles can obtain details of the enquiry upon application to the Department of Overseas Trade, 35 Old Queen Street, London, S.W.1. Reference number A.X.8720 should be quoted.

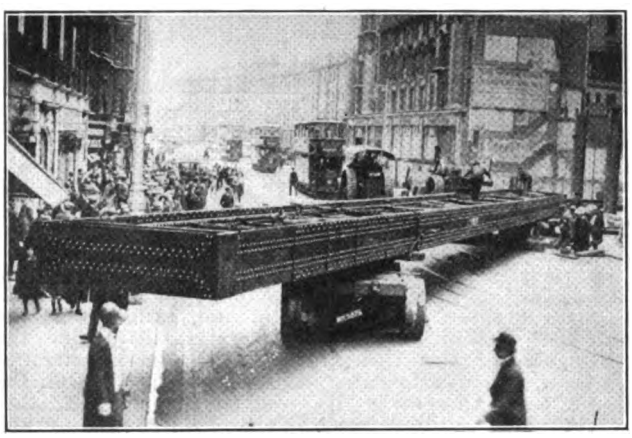
Notes and News.

London Cartage and Haulage Contractors' Provident Institution.—The Annual Dinner of the London Cartage and Haulage Contractors' Provident Institution, in aid of the funds, will be held at the Connaught Rooms, Great Queen Street, W.C., on Tuesday, the 26th November next, when Sir Walter Gilbey, Bt., will preside. The Institution is established for the purpose of aiding its aged and necessitous Members and their dependents, and also maintaining, clothing and educating the children of such Members, or of deceased Members, where circumstances warrant such assistance. The Dinner will be followed by a short Concert and then by a Dance and we appeal to our readers to support the Fund by being present and by inducing as many of their friends (both ladies and gentlemen) as possible to be present. The price of the tickets is Fifteen Shillings each, not including wine, and Mr. R. P. Bailey, the Hon. Secretary, will be glad to forward tickets upon application to him at 17 Water Lane, Great Tower Street, London, E.C.3.

Hauling a Heavy Girder by Road. — We have received the interesting photograph, which we reproduce, from Coulson & Co., Ltd., heavy haulage contractors, Coronation Road, Park Royal, London. The girder in question is 102 ft. long 8 ft. 9¾ ins. deep and weighs 70



TRANSPORT BY COULSON & CO., LTD.
THE GIRDER IS 102 FEET LONG AND WEIGHS 70 TONS.

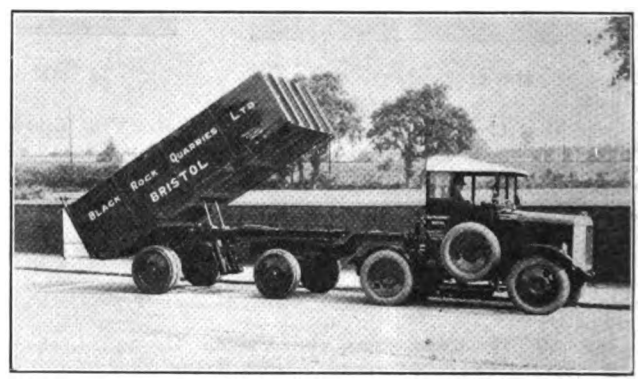
tons. It arrived in London by rail and was transferred to road at Chelsea Basin Goods Depot and was then hauled to the site of the New Victoria Super Cinema. Before this was done the roads were carefully surveyed in order to decide upon the best route, and all corners and obstacles were carefully measured up to make quite sure that it was possible to take such a long girder through the streets without any hitch. Two heavy machinery trailers were used for the transport of this unusual load, drawn by two large traction engines, but it was found that one of these engines was sufficient to haul the load without any trouble. On its arrival at Victoria it was manoeuvred across the road, unloaded on to massive solid rollers, and rolled in on to the site where it was jacked up and put into position. It is interesting to record that no trouble whatever was experienced in taking this enormous girder through the streets of London.

Cadbury and Fry Joint Transport Department. — The Transport Department of Cadbury Bros., Ltd., Bournville, Birmingham, and that of J. S. Fry & Sons, Ltd., Bristol, is now being operated as one unit, known as the "Cadbury and Fry Joint Transport Department." The headquarters of the joint department are at Bournville, and all major negotiations in connection with transport services are conducted from there on behalf of both firms. Local routine matters will continue to be conducted from Bournville and Bristol respectively, but the general administration of the department will be conducted from headquarters. Mr. A. G. Marsden, Supervisor of the Bournville Transport Department, becomes Supervisor of the joint department, with Mr. C. G. Welch, head of the Bristol Transport Department, as assistant Supervisor, and each has executive authority to act for either, or both, firms in relation to transport arrangements.

Shire Horse Society.—At a meeting of the Council of the Shire Horse Society, held last month, at which Mr. A. Thomas Loyd (President) occupied the Chair, 62 new members were elected. The 1930 London Show will be held on February 25th, 26th, and 27th.

"Cybro" Proofing.—Having known Mr. J. H. Brown, of J. H. Brown & Co., Ltd., Canvas Waterproofers, Tarpaulin and Tent Manufacturers, Electric House, Bow Road, London, E., for many years we were interested to have a call from him and to learn something about the new proofing which he has produced for lorry and wagon covers, tarpaulins and tents. This is registered under the name "Cybro" and is an entirely new and improved process for chemically proofing all kinds of canvas. It permeates the yarns of the fabric and is not a mere surface dressing to be rubbed off in wear. Another quality is that it permanently retains its suppleness under all conditions and does not become stiff and crack in process of time. Its greatest quality is that it is impervious to water, and Public Testing Station Certificates show that "Cybro" proofed canvasses are capable of withstanding the most severe tests to which proofed materials are subjected.

Chenard-Walcker Tractor and Trailer for Stone Haulage. — Chenard-Walcker Tractors, of Stevenage Road, Fulham, London, S.W.6, have supplied one of their high-speed tractors together with a 12-ton hydraulic tipping



A CHENARD-WALCKER TRACTOR AND TRAILER FOR BLACK ROCK QUARRIES, LTD.

trailer to Bryant & Langford Quarries, Ltd., of Bristol. Since supplying these, the firm have received further repeat orders from the Quarries Company, which are in course of construction. Particular attention is drawn to the fact that there is very little overhang at the rear of the trailer chassis, which is usual when tipping is required.

Dunlop Building Temples for Native Workers. — Two million young rubber trees are now being planted in the Dunlop plantations, Malaya, section by section as the heavy tropical jungle is cleared and its soil prepared over an area of sixteen square miles. In ten years' time it is expected that the new trees will yield an annual crop of 5,000 tons of rubber. At present 8,500 tons of rubber a year is being tapped from four million trees. Every other day a very thin strip of bark is cut from each tree, and the fluid rubber drips into the cup below. As each cup receives on the average, only half an ounce of dry rubber daily, between six and seven hundred million cupfuls of it have to be collected in the course of twelve months. One-third of the native workers are Chinamen, but the bulk of them are Tamil, specially recruited from the South of India. Temples for their worship are built by the Dunlop organisation, which also provides houses and hospitals for them, schools for their children, and rice at cost price. Golf courses have been laid down for the European staff, whose Rugby team is making a bid for the championship of Malaya. Early next year, the dense jungle is to be tackled over a further sixteen miles of the Dunlop territory, which is more than 125 miles in extent.

Change of address. — Owing to the growth of their business, the R.E.A.L. Carriage Works, Ltd., Motor Body Builders and Repairs Specialists, have removed from 102 Strand-on-the-Green, Chiswick, to more spacious premises at Pope's Lane, Ealing. The telephone number is Ealing 5966.

Commercial Motor Transport Exhibition.

Inaugural Luncheon.

THE Inaugural Luncheon in connection with the Commercial Motor Transport Exhibition, which opened at Olympia on Thursday, November 7th, found gathered together representatives of every branch of commercial motor transport, manufacturers and users alike. Mr. J. Maughfling, C.A., of John I. Thornycroft & Co., Ltd., President of the Society of Motor Manufacturers and Traders, presided, and the chief guest was Mr. Herbert Morrison, M.P., Minister of Transport. The number present was a record, the whole of the large luncheon hall at Olympia being filled with more than 400 members and guests.

The Minister of Transport, in proposing the principal toast—the Commercial Motor Transport Industry and Exhibition, said one of the outstanding economic facts of the trade depression period was that when industry as a whole was having a thin time, there had been a rapid and continuous development in the manufacture and use of British commercial goods vehicles and the larger types of public service passenger carrying vehicles.

Increase in Vehicles.

In the summer of 1923 there were approximately 173,000 goods vehicles of the van or lorry type, but by September, 1928, there were over 300,000. Motor hackney carriages, which included omnibuses, motor coaches, taxi cabs and private hire cars had grown from 86,000 to 95,000 in the same period, a large proportion of which increase was in respect of omnibuses and motor coaches. These figures did not include vehicles exported overseas, in particular to the Dominions, where he hoped and believed the industry would find rapidly increasing markets.

A Progressive Industry.

The Commercial Motor Exhibition itself, which was the most striking exhibition entirely devoted to commercial road transport as yet held in any country, was a testimony to the progress of the industry and constituted a tribute to an industry which had had to face enormous difficulties in the post-war period. Britain had led the world in transport by sea and by rail, and we were now making strides towards predominance in the air and on the road. We had set up international records in speed by air and road and it was reasonable to assume that the great developments thus secured would be an advantage to British products.

The quality of British commercial goods vehicles had long been pre-eminent, taking account not only of the first cost but also maintenance costs, long life and freedom from breakdown. British commercial vehicles were second to none, according to calculations based upon actual experience and cold fact.

The overseas market was important. It was a market in which British commercial vehicle manufacturers had achieved considerable success, but they must resist all temptations to be satisfied with the success already achieved and must be ever alert to seek new markets, to cultivate good relationships with existing markets, and to anticipate the needs of the world.

Road and Rail.

It would, in the Minister's judgment, be a bad day for British transport when it was assumed that there was inevitable and permanent conflict between rail and road as a means of transport. The railways could do some things better than road transport and constituted a considerable relief to road congestion. In other ways road transport had advantages of convenience and point to point collection and delivery. What they had got to do was to secure the use of the best means of transport for the purpose in hand. Any Government who stood by and allowed the reckless building up of an excess provision of transport facilities would be making trouble for labour, industry and the tax payer in the future.

Technical Developments.

In the course of his tour of the Exhibition, apart from the general improvement which continued to be shown from year to year, and the high quality, there were one or two technical developments of great interest and importance to which he would like to draw attention.

Pneumatic Tyres.

The adoption of the pneumatic tyres on heavy goods and passenger carrying vehicles was becoming widespread. The change-over from the solid tyre to the pneumatic tyre had resulted in better comfort for the passengers and less wear and tear of the chassis. Experience had shown that, provided operators took due care to follow the manufacturers' instructions, the pneumatic tyre was a safe and reliable fitting for a heavy vehicle.

Objections to Steel Tyres.

A vehicle which was something of a problem to those responsible for the maintenance of the roads, though small in number, was the heavy tractor equipped with steel tyres. Modern road surfaces, suitable for the accommodation of fast moving traffic, could be constructed to withstand reasonably heavy loads, but the cutting action of sharp-edged steel tyres, sometimes fitted with steel strakes, was unduly severe. There were signs that many of these tractors were being equipped with some form of rubber tyre, and it was to be hoped that this conversion would increase in the future.

Another development was the rigid-frame six-wheeler, particularly in connection with passenger road transport. There had been a very rapid development of long distance motor coach traffic, the country now being covered by a network of services, some as much as 300 miles in length.

The Ministry of Transport.

In conclusion, Mr. Morrison congratulated everybody concerned with the Exhibition on their work and hoped that the Exhibition would be a success. The Ministry of Transport existed to serve the nation as a whole firstly, and secondly all those engaged and interested in transport, whether as manufacturers, drivers, users, passengers or pedestrians. He asked them to regard the Department as an institution which was always at their service, and which existed for the purpose of furthering the efficiency and well-being of the great transport industry.

Mr. J. Maughfling responded to the toast.

The Guests.

The toast of the guest was proposed by Mr. G. M. Young, London Director, the Albion Motor Car Co., Ltd., Chairman of the Exhibition Committee, who said that the Minister of Transport would have every support from the industry in his endeavour to bring the present archaic laws up to date. They hoped that the new Traffic Bill, which they understood would be introduced at an early date, would become the law of the land in the very new future.

They also had with them the Chairman and other members of the Royal Commission which had now published two excellent reports. He desired to draw attention to one or two points in connection with these reports which they considered were of great importance to the motor industry.

Constructional Requirements.

It was extremely important that constructional requirements for both bodies and chassis should be uniform for all parts of the country and that those requirements should be controlled by the Ministry of Transport. At the present time the varying demands of different local authorities throughout the country were causing the utmost confusion to both manufacturers and operators.

Where manufacturers were building for stock, modifications to bodies and chassis to suit different local authorities meant serious additional expense and delay.

Speeds.

As they were aware, four different maximum speeds were proposed in the report:—

Private cars, no speed limit; heavy passenger vehicles, 35 m.p.h.; light goods (not exceeding 50 cwt.), 30 m.p.h.; heavy goods vehicles, 20 m.p.h.

He suggested that in practice it would be impossible to differentiate between the heavy passenger vehicle and the heavy goods vehicle. One could imagine that on a road, such as the Birmingham-London road, which was comparatively narrow, if heavy passenger vehicles were continually drawing out to pass heavy goods lorries, the average speed of the traffic would be seriously interfered with. They hoped that ultimately a uniform maximum speed of 35 m.p.h. would be embodied in the Bill for all classes of goods and public service vehicles.

Licensing.

The proposal to divide up the country into 14 traffic areas with area commissioners responsible to the Ministry of Transport had the cordial support of the industry.

The toast was responded to by Sir William Lobjoit, O.B.E., J.P., and Major-General S. S. Long, C.B.

Railway Road Transport.

THE following are extracts from the notes which formed the basis for discussion between the Railway Companies and the Manufacturers of Motor Vehicles at the Conference held at Olympia on Friday, November 8th. They fall, naturally, into three broad headings:—

(1) Requirements for collection and delivery of merchandise and parcels.
(2) Requirements for vehicles for passenger traffic for working in conjunction with railway systems.
(3) Technical requirements as regards chassis design.

(1) The cartage or collection and delivery service in connection with the transportation of general merchandise is a very important feature of the service the Railway Companies give the trader.

The advent of the internal combustion engine has, however, added considerably to the problems to be dealt with in connection with railway cartage, whilst at the same time it has enabled the Companies to widely extend their scope of usefulness to the trader.

The great advantage of the motor, is in the manner in which it has enabled the Railway Companies to extend very considerably their collection and delivery services.

The aim now in all directions is to give to the trader what may be termed a door to door service, and to-day the Railway Companies are collecting and delivering from and to villages and districts within a radius, in many places, of 10 miles from the railway station.

In the collection and delivery services experience shews that the two and four-ton types of motor lorry have been the most satisfactory units having regard to class of traffics to be dealt with; but there is now evidence that higher capacity vehicles at places can, with advantage, be utilised, and several of the Companies have introduced high capacity vehicles.

Variations of the Tractor Trailer and flexible multi-axled combination appear to offer distinct possibilities for the higher capacity class of vehicle.

It is probably correct to say that no phase of the Railway Companies' activity has undergone so great a change as their cartage service has within recent years, due to conditions which have grown up materially following upon the rapid improvement in internal combustion engines.

Motor Parcels Vans in large numbers have been employed for the past several years in connection with the collection and delivery of passenger train parcels traffic. Motor Vans have been introduced with the view of giving more expeditious collections and deliveries and enabling extended areas to be covered. In large towns they are usefully employed in the transfer of traffic in bulk between the various termini, avoiding circuitous transfer by rail, and saving considerable time.

It will be seen from the foregoing that the first cost and subsequent operating costs have to be carefully balanced by both the using and maintenance sides of the Railways' Road Transport activities, and that the interest of both sections is a common one in solving the problem for the Railway Companies of road haulage efficiency.

(2) As regards vehicles for Passenger traffic, the Railway Compaines are deeply interested in the character and quality of the Road rolling-stock for operation in this country, both now and in the future.

With the passing of the Passenger Road Transport Acts of 1928 and what might be called the "arrival" of the Railway Companies into the Passenger Road Transport industry, a further process of co-ordination has begun, namely, the building up of a mutuality of interest between the established Road Transport undertakings and the great railways with whom so far there has been very little inter-working, but instead and to a great extent, an unfruitful competition.

Viewing the country as a whole, undoubtedly the single-deck omnibus giving thirty or thirty-two seats is the best all-round machine, and the composition of the fleets of the large operators testifies as to experience having proved the single deck omnibus of this type to be the general utility model.

With co-ordination as between Railway and Road interchange of traffic between those transport 'media will become a regular feature and be stimulated by the facilities which it is intended to provide for such an exchange. A fair proportion of such passengers will have luggage, and how, in a general design, greater and more readily accessible luggage accommodation than is oft-times provided can be made available is a matter to which consideration might be usefully directed.

The twenty-seater vehicle is of definite utility in districts of relatively sparse population, the possibility of such machines being operated by one man being a factor of economic importance where the earnings per mile are low and insufficient to support both driver and conductor. Again, the small omnibus can be usefully employed for pioneer work, being replaced by larger types as the traffic becomes developed on the routes.

The double-deck omnibus, so familiar in London, is, in a modified form, gaining increasing favour in the provinces where the density of traffic warrants its employment, and such vehicles, mainly on urban routes, are doing good service.

To refer briefly to the long distance coach; this has come to stay, although possibly in a different and higher stage of organisation and development from to-day. In the long-distance coach more comfort, more leg room and more stowage are matters of moment, for to travel in a public vehicle for dozen or twenty miles is one thing, and to journey a hundred miles or more is quite another.

(3) Considering the technical requirements of Railway merchandise vehicles, it must be borne in mind that most of these have to stand out in the open station yards at night, without garage accommodation, during which time they are moved about for loading purposes. Consequently the following requirements stand out as paramount:—

(a) Protection of vital parts from damage in congested yards.
(b) Devices to facilitate starting from cold.
(c) Arrangements for rapid and complete emptying of the water cooling system.

Great importance is attached by the Railway Companies to the provision of a proper centralised lubrication system.

There would appear to be great scope for economy in engine maintenance by the adoption of renewable steel cylinder liners and valve seatings.

Forward control offers great advantages over standard control for Railway purposes, the overall length being as much as 4 feet less, with the same loading space, and the turning circle at least 12 feet less. The improved manœuvrability thus provided greatly increases the utility of the machine, particularly in congested goods yards.

Proper provision should be made for the fitting of non-skid chains to the wheels.

There would appear to be considerable scope for economical production if more of the S.M.M.T. provisional standards were incorporated in the specifications of vehicles ordered by large buyers, with the added advantage of increased interchangeability of various parts and units. It is suggested that there is scope for joint enquiry into this matter by the S.M.M.T. and the Railway Companies.

It is well known to operators that there is much difficulty in maintaining pneumatic tyres at the correct pressure of inflation, and it is to be hoped that in the near future tyre makers will be able to provide a self-registering pressure gauge on each wheel of the vehicle, from which the pressure can be seen at a glance.

Another problem that the giant pneumatic has brought in its train is that of handling the spare wheel.

Some mechanical lowering and raising device which does not interfere with body space would be welcome.

An inexpensive accurate petrol gauge is also a very desirable feature.

A governor limiting the maximum vehicle speed as opposed to the engine speed, appears to be well within the scope of modern manufacturing resources; and would undoubtedly tend to decrease accidents. The[illegible] on the roads of swarms of high-speed li[illegible] of 50 m.p.h. in the hands of irrespons[illegible] cause apprehension in the minds of a[illegible] and all others who have the safe deve[illegible] Transport at heart.

Every om each tree, low. As each of dry rubb[illegible] road

It should be emphasised that the Railway Companies' Operating and Technical Departments welcome every step being taken by the manufacturers to produce safer and more silent vehicles.

It would appear that both operators and manufacturers must prepare themselves for safeguards in connection with the construction and inspection of vehicles which they must inevitably be called upon to adopt for the general safety of the public on the roads.

It is believed that the goal of increased safety for all road users will be approached by grouping the bulk of Road Transport vehicles in the hands of large responsible operators. This will tend to eliminate the small man, who, in his endeavour to snatch a livelihood from the Transport industry, by ill-maintained machines manned by under-paid and over-worked drivers, is often a source of annoyance and danger to the public, and annoyance and expense to the manufacturers

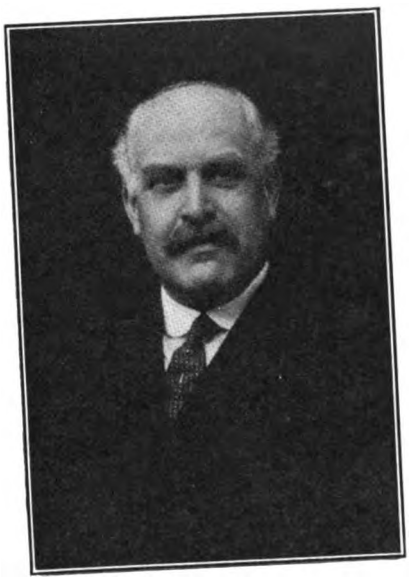
Scientific Research in Transport.

Presidential Address to the Institute of Transport.

SIR JOSIAH C. STAMP, G.B.E., D.SC., LL.D., President, Institute of Transport, delivered the inaugural address of the 1929-1930 session of the Institute at a meeting held in London, on October 14th last.

Taking for his subject "Scientific Research in Transport," the President said that our present system of transport claimed to have the public virtues of severe competition within each particular form of transport and severe competition *between* the different forms—a competition which extended not only to the financial results, but to the scientific progress in each. Where the competition is not or cannot be perfectly free, then a considerable measure of regulation originally intended to be in the public interest exists. Where competition is free, but is bringing its own nemesis in public inconvenience, a small measure of regulation is being introduced. We were now beginning to get the glimmerings also of co-operation. There was no guarantee under such a system that any one section of transport, in ignorance of the true costs and scientific position of the other, might not embark large sums of money upon projects which might be quickly rendered obsolescent by an imminent advance elsewhere; or, alternatively, might not *fail* to embark large sums of money for fear that obsolescence would come about through some suspected advantage or scientific improvement that was likely to arise, but yet actually did not arise, in a rival form of transport. The fear of extending an existing capital equipment because of its potential annihilation by some rumoured or suspected scientific change or advance in another field, might be a very real one, especially in days of large units and many alternatives. We had to-day gone a long way beyond the stage of imagining that the ruinous cheapness of commodities or services supplied below their real ultimate and long-distance costs, was any lasting advantage to the public. A single economic mind and control, in its ideal form, would weigh up the advantages to the public, as a whole, of the better services obtained by a premature scrapping and annihilation of capital as against the alternative and unseen services which the public would get in other directions by the application of new capital to other objects, which was capital now required or used for superseding old capital. But if it was utopian to think of a single-minded ideal control free from bureaucratic disadvantages expending the whole capital for transport in the most advantageous way in transport, it was still more utopian to think of that economic mind going beyond what would be the most favourable balance sheet and profit and loss account *for itself*, into making sacrifices inside its own activities for the sake of the larger good beyond itself, especially where such larger good was intangible. He feared, therefore, that the question of the greatest public advantage from the accumulation of expenditure of capital as a whole, was too distant a dream for [illegible] now. We must learn simpler lessons first. At the as a means [illegible]ght take as our utopia the greatest public things better [illegible]e capital expended in the particular sphere siderable relie[illegible] leave the comparison of this with other uses transport had [illegible]we are in a fair way to achieve this nearer go[illegible] collecti[illegible]dgment the various forms of transport, while over part [illegible] the field complementary and assisting each other, are al[illegible] over another large part of the field alternative and competitive and it would be idle to suggest that, in the agencies supplying the latter field, there was yet any general movement for single-minded consideration of the problems.



SIR JOSIAH C. STAMP, G.B.E., PRESIDENT, INSTITUTE OF TRANSPORT.

WHAT DOES THE INSTITUTE OF TRANSPORT STAND FOR?

For the first time the Institute of Transport had abstracted from a number of other hitherto quite separate services, a common function, and agreed to look at that common function more by what it represented as a single idea of economic service than by the varied ways in which it was discharged. All the sciences and public services and businesses used statistical methods, specialised for each, and those methods could be abstracted and generalised into a set of principles in a science for common application to all kinds of material, and that science then became the handmaid of the other sciences. "So when the civil, mechanical, and electrical engineers, surveyors, economists, manufacturers, merchants, accountants and financiers, 'hive off' from their respective spheres of thought all that has to do with transport, and bring it under one study and roof and mode of consultation, or consideration, they do not relinquish their respective professions, but they cultivate a new and common hinterland."

The Institute of Transport represented first, the abstraction of the idea of a particular service, however performed, and, second, a new territory for study which was at the same time a part of the territory of existing professions and businesses. We might reasonably expect that in due course it would induce appropriate reactions in thought which would be a consideration of identities more than differences. If the Institute was a collection of different and often competing interests, each of which studied only its own particular field, it would fail in its object. It would give nothing more than the past had done. But in course of time it would be almost impossible for interacting influences not to be felt. It might well be that the older members of the railway, shipping and road interests would never talk the general language of *transport* easily—they would always have the accent of the old home, and the point of view of their own calling. But the young men who would become masters of their several crafts of transport in the general context of a single overriding science of transport, would some day form a body of men whose thoughts moved interchangeably in its several forms, to whom co-ordination, correlation, collocation and colligation would be second nature. Instead of thinking of co-operation as a risky sacrifice or interests, or a mere insurance against loss, they would think instinctively of the most appropriate and economic form of transport for a particular task, and any deviation from it, or duplication of it, would be unscientific and repugnant. But nothing was gained by attempting the second day's journey before the first was run or even planned. What was the immediate possibility, and, therefore, the immediate duty?

He considered that earliest attention ought to be given to see that the pressure of scientific research was applied equally at all points of the problems of transport. Each branch of transport ought to know what were the chief problems before the others, and how they were being tackled. Each ought to have available the results of the other's efforts, in a common language. An even pressure of scientific research over the whole field was essential. Comparison of the results was essential. These could only be compared in a common language of economic costs and efficiencies. When this had been done we could possibly say that hard won savings had been applied to the best point of public advantage. A true costing of road and rail costs for a similar service, down to their ultimate essentials, including public costs, had hardly yet been made. Yet a wise community would try to make it before embarking large sums of social capital.

Referring to the initiating force which brought about a change, the President said that an invention or discovery of a general principle had to find numerous particular applications before it could be produced economically. It needed a very real partnership in the research and the experiment between the one with a generalised *supply* knowledge and the other with a particularised *demand* knowledge, to hit upon the right application. With highly divided and technically distinct sciences, there had been a tendency for each to think of the solution of a financial problem only within the limits of itself, but there was a much greater tendency to-day to unify scientific problems.

Our several means of scientific advance were as follows:—

1. The individual scientist.
2. The firm's research departments (*e.g.*, the Bell testing establishment has 4,000 investigators and assistants).
3. The National Physical Laboratory.
4. The Universities.
5. Such associations as the Non-Ferrous Metals.

Research on scientific lines was required in every branch. In his view there should be in every department and business, some minds set aside for considering change and improvement, and for experiment. More could be accomplished by ten such minds on a problem in its most favourable setting, getting three yards into the problem, than a thousand men

Digitized by Google

with their many daily occupations, snatching a few moments of amateur application and each getting three inches into it. The practical man had been well described as one who practised the theories of fifty years ago. He often considered himself strongest where he was really weak.

"When does the ordinary adaptation of his resources to the local demands by a trader or manufacturer or transport agent, become something that can be dignified by the name of scientific research? My answer is when it ceases to be trial and error, empirical, and proceeds by recorded experiment under control to general principles, capable of general application as a new way of doing old things, or a way of doing new things."

Referring to the latest method adopted by the railway companies for improving transportation over their systems—viz: the container—the President said that containers had proved their worth and provision for adding to the existing stocks was now an established feature in the railway companies' programmes of development; in fact, experiments were being conducted with the object of devising other types for traffics not hitherto dealt with by this method.

AIR VICE-MARSHAL SIR W. SEFTON BRANCKER, K.C.B., A.F.C., DIRECTOR OF CIVIL AVIATION, IMMEDIATE PAST-PRESIDENT.

THE FUTURE OF THE INSTITUTE.

The existence of the Institute of Transport would lessen the drawbacks of watertight compartments in departmental practice, where there was no relation made between the different results of each. It ought to do something to prevent the lack of continuity and comparability in research. But, of course, above all, it ought to help create a type of mind which would fill the present need, men of general knowledge of principle, restless enquiring outlook, rigid scientific proof, with the knack of experimentation and deduction. How might it bring that to pass? Here were some possibilities:—First, by bringing the different interests under one roof and into a common journal. Second, by the curriculum and syllabus for training of new entrants. Third, by encouraging the exhibition of results of scientific research to each other. Fourth, by encouraging papers dealing with comparative aspects, costs, etc., in its journal. Fifth, by standardising the language and procedure of economic costing. Sixth, by joint committees for common work on comparative questions which should not be experts defending points of view, but experts co-operating for the search of truth. Seventh, by a single-minded unity in presenting its work to the world. Competition would still exist between the forms of transport. But its preliminary heats would be fought out on the drawing board, in the laboratory, and on the costing sheets. The Institute would not do all this to-day, or to-morrow, but surely the results would come. If we could not see the goal, at least we knew the direction and could set a course that met the day's demands with the day's weakness and strength, but led to the promised land.

* * * *

The Retiring President, Sir W. Sefton Brancker, K.C.B., A.F.C., occupied the Chair at the opening of the Meeting at which the medals gained during the previous session were awarded. Full particulars of these appeared in our last issue.

Sir Sefton Brancker then introduced the incoming President—Sir Josiah C. Stamp, G.B.E., and placed upon him the Badge of Office, speaking in very high terms of his qualifications for the Presidency. Following his presidential address Sir Josiah Stamp handed to his predecessor the usual souvenir of his year of office and took the opportunity to return the compliment by eulogising the high qualities of Sir Sefton Brancker. A hearty vote of thanks to the retiring President, for his services during the past year, and to Sir Josiah Stamp for his masterly address, was then proposed by Mr. Robert Bell, C.B.E., and seconded by Sir Henry Maybury, G.B.E.

Heavy Motor Car (Amendment) Order, 1929.

THE Heavy Motor Car (Amendment) Order, 1929, dated 11th October, 1929, has been made by the Minister of Transport, and comes into operation on January 1st next.

The new order deals with the use and construction of articulated vehicles. The expression "articulated vehicle," is defined in the Order to mean a heavy motor car together with a trailer drawn thereby which is so constructed and by partial super-imposition attached to the heavy motor car that a substantial part of the weight of the trailer is at all times borne by the heavy motor car.

Every wheel of an articulated vehicle shall be fitted with a pneumatic tyre or tyre made of soft or elastic material.

Where any wheel of an articulated vehicle is fitted with a tyre which is made of soft or elastic material but is not pneumatic, the rim diameter of that wheel shall be not less than 670 m.m.

The total overall length of an articulated vehicle, excluding any starting handle, shall not exceed 33 feet.

The weight borne by any wheel of a trailer forming part of an articulated vehicle shall at no time exceed 3¼ tons.

The total weight of an articulated vehicle together with its load (if any) shall at all times be such and so distributed that the weight transmitted to any strip of the surface upon which the vehicle rests contained between any two parallel lines drawn two feet apart on that surface at right angles to the longitudinal axis of the vehicle shall not exceed 10 tons.

The total weight of an articulated vehicle together with its load (if any) shall be so distributed between the wheels of the heavy motor car forming part thereof and the wheels of the trailer forming part thereof that:—

(*a*) where the trailer has not more than two wheels in contact with the ground, the total weight borne by those wheels of the heavy motor car upon which the brakes of the heavy motor car act shall at all times exceed the total weight borne by the wheels of the trailer;

(*b*) where the trailer has more than two wheels in contact with the ground, the total weight borne by those wheels of the heavy motor car upon which the brakes of the heavy motor car shall at all times be not less than three quarters of the total weight borne by the wheels of the trailer.

For the purpose of determining the weight borne by any wheel of a trailer forming part of an articulated vehicle any two wheels of such a trailer shall be regarded as one wheel if the distance between the centres of the areas of contact between such wheels and the road surface is less than 18 inches.

Where the trailer forming part of an articulated vehicle has more than two wheels in contact with the ground, it shall be so constructed that, however the vehicle is loaded, if, when the vehicle is standing upon a level surface, any one wheel of the trailer is lifted and supported at a distance of 6 inches above such surface the load borne by any wheel shall not be increased by more than 10 per cent.

Rickshaws on Pneumatics. New Japanese Union of Ancient and Modern. — Pneumatic tyres for the native rickshaws of Japan is causing a rapid increase in the tyres used by that country, where the motor car is not yet a popular feature of everyday life. "The Japanese would not part with their rickshaws," said Sir George Beharrell, managing director of the Dunlop organisation, in an interview," so we put pneumatic tyres on them. The streets in many cities are too narrow for motor traffic, but the recent earthquake remedied that to a great extent. Yokohama is now rising as a model metropolis with broad avenues and amazing business activity."

Rear Lights on Vehicles. — The Royal Automobile Club wishes to point out that there is a certain amount of laxity on the part of drivers of horse-drawn vehicles and cyclists in carrying out the provisions of the Road Transport Lighting Act, under which all vehicles are required to carry a red rear warning device during the hours of darkness. This laxity is most marked in remote country districts, and the R.A.C. therefore warns motorists to exercise even greater caution than usual in the circumstances. Particular attention is directed to the difficulty of detecting a single unlighted vehicle among a number of others equipped in conformity with the law, and all motorists should be on the alert.

Commercial Motor Users' Association.

Twenty-fifth Anniversary Banquet.

H.R.H. The Prince of Wales, K.G., was the guest of honour at the twenty-fifth anniversary banquet of the Commercial Motor Users' Association, held at the Savoy Hotel, London, on October 15th last.

Mr. Geo. Monro, C.B.E., M.Inst.T., President of the C.M.U.A., was in the Chair, and a large and distinguished company included the Japanese Ambassador, members of the Government, heads of many societies and leaders of organisations connected with motor transport.

The President read the following loyal message which had been sent to His Majesty The King. :—

"Members and guests of the Commercial Motor Users' Association, of which organisation Your Majesty has been Patron since 1920, now assembled for the celebration of its twenty-fifth anniversary banquet at which His Royal Highness the Prince of Wales is the principal guest, present their humble and loyal duty to Your Majesty. We thank Your Majesty for the gracious interest which Your Majesty has at all times taken in the progress of the road motor transport industry, and we desire to express the sincere hope that Your Majesty will be speedily restored to full health and strength," and announced that the following reply had been received from The King's Private Secretary :—

"The King has received with much pleasure the message from the members and guests of the Commercial Motor Users' Association, and is glad to think that The Prince of Wales is with them on this auspicious occasion of their twenty-fifth anniversary. As Patron, The King thanks all present for their good wishes and trusts that the road motor transport industry may continue to develop and prosper." (Applause).

Congratulatory cablegrams were received from C.M.U.A. Organisations in Tasmania, Victoria, New South Wales and Western Australia.

H.R.H. THE PRINCE OF WALES, K.G.

The Prince of Wales and Road Psychology.

H.R.H. The Prince of Wales, K.G., proposing "The Association," said that twenty-five years ago, the internal combustion engine was absolutely in its infancy. To-day there were more than 400,000 vehicles on the road for passenger and goods traffic. Throughout this period of quite amazing progress, the Commercial Motor Users' Association, which shared with the Royal Automobile Club the patronage of The King, had been looked up to as the big representative of heavy motor traffic. They had indeed worked unceasingly to develop and popularise one of the most progressive sides of the industry in this country. From the earliest days, the C.M.U.A. had given the greatest possible encouragement to motor drivers to take an interest in the care of the vehicles in their charge, and had also urged employers to see that their employees were good drivers. The C.M.U.A. organised parades of commercial motor vehicles, and conducted examinations of drivers in London and other big cities, giving prizes and diplomas, and this had done an enormous amount to raise the standard both of driving and the upkeep of vehicles.

Who would have visualised twenty years ago the extraordinary situation as we knew it to-day, with the well-maintained fleets of commercial vehicles which they lived with on the road (laughter). With all due deference to our railway companies, these fleets enabled our manufacturers to transport materials from place to place with the minimum of handling and disturbance of the community, and the small retailer had the great advantage of having his goods delivered right to his shop by the big distributing firms. An even bigger development which the C.M.U.A. had helped was the omnibus and motor coach services of Great Britain, and that was one of the most striking features of the road at the present time, bringing transport by road to thousands who would not otherwise have the opportunity. Much of this great progress was due to the C.M.U.A.

He hesitated to say it in the presence of speed kings of the road and air* and in the presence of more experienced motorists than himself who were not speed kings, or probably were not considered so by the others (laughter), but he had had some experience of the roads although possibly sometimes for convenience he had deserted the road for another element. Might he, looking down from his new vantage point speak for one moment of what he might call the psychology of the road? He would start with the private car user who was at times extremely inconsiderate. He never thought of the unfortunate man driving a lorry, say from Bristol or Birmingham, or very much farther afield to London, and he was almost inclined to put him "over the rails," and when the next motorist came along, the lorry driver tried to get back a little bit and would not get out of the way.

Users of commercial motors could often impress upon their employees the need to give room to faster vehicles built for quite another purpose, and so allow people to go at a rate to enable them to keep business appointments and not to block the road.

The problem of the roads was very serious, and it might become much more serious if all the commercial motor users and the private car users did not get together and co-operate to solve the problem and prevent it from becoming the great battle of the roads.

With the toast he wished to couple the name of their Chairman, Mr. Geo. Monro (applause). Mr. Monro was an old friend of his, and had been interested in the C.M.U.A. since its inception, and he could tell them that their Chairman got up earlier than most people; in fact one had to be out very early indeed to get ahead of him (laughter).

His Royal Highness then placed the Presidential Chain of Office on the shoulders of the Chairman and received an ovation at the conclusion of his speech.

Reply by the President.

Mr. Geo. Monro, C. B. E., M.Inst.T., President of the Association, was enthusiastically received on rising to reply.

He said that before responding to the toast so ably proposed by his Royal Highness the Prince of Wales he wished to extend to him a very hearty welcome. They all knew what an extremely busy man the Prince was, and they knew also the vast amount of voluntary work he undertook in his desire to help every section of the community. They were delighted to see his Royal Highness and they thanked him (loud applause).

The Commercial Motor Users' Association was formed twenty-five years ago, and he was sure they were glad to know that the four gentlemen who undertook that work were present that evening; they were that grand old man of motoring, Colonel Crompton, Mr. Douglas Mackenzie, Mr. Shrapnell-Smith and himself, and he thought that their work had proved to be sound, judged by the results of the last twenty-five years. They had based the whole of their rules and regulations on three main points. First—they should act as a service to the community; second—service to the Government, and third—service to their members. They laid down one cardinal principle which was that whatever they did they should be absolutely non-political.

They saw many signs of their success. The C.M.U.A. membership had grown from representing under one hundred lorries in 1903 to over 110,000 lorries. They saw their success again in their happy relations with kindred trade bodies, and again in the fact that the Government Departments came to them to obtain the views of commercial motor users, and local authorities came to their local area committees for advice.

*This was a reference to the presence of Sir Henry Segrave, Squadron-Leader Orlebar and Flying Officer Waghorn.

Digitized by Google

Possibly the most difficult period through which the Association had passed was when they were engaged in fighting what was known as the Butt case. They did not win; he believed they lost all along the line, and the case cost the Association thousands of pounds. Yet although they lost they won, because they were able to establish the principle that roads must be constructed to bear the traffic that might reasonably be expected to come upon them. Therefore the result was well worth the time, anxiety and money spent.

They had assisted the government, if he might be permitted to put it that way, with regard to the Bridges Bill, just placed upon the Statute Book. There were large areas of country almost isolated so far as road transport was concerned by reason of weak and restricted bridges, and when the work had been carried out which was now possible under the Bridges Act, he thought they would be able to approach every main town by road from any direction.

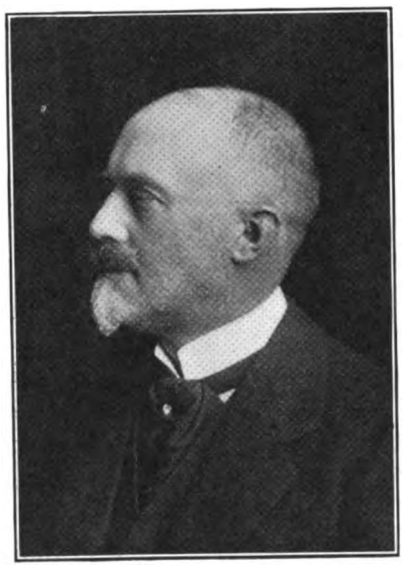
He did hope that the Government would consider the question of building more bridges over the Thames, as this would go a long way towards reducing congestion which was nearly always to be found at the bridge heads.

The Association was putting their views before, and hoping to assist, the Government in their endeavours to deal with the question of level crossings which were a source of great danger on our roads.

He had said that the Association was non-political; he did not depart from that in the slightest degree, but he did feel that he was entitled to say that if the money colleced from motor transport had been devoted to the purpose for which it was specially intended, then all their troubles would have gone by the board a long time ago.

His Royal Highness had touched lightly upon some of the causes of complaint that the public had against the commercial motor vehicle. There was the question of lighting. The members realised their responsibilities, but were troubled in two ways—one, the inefficient lighting of some of the older lorries and, two, the want, perhaps, in some cases of sufficient courtesy towards other users of the road. These matters were always before the Association, and undoubtedly the position with regard to lighting would improve as new lorries came upon the road with their efficient electric lighting apparatus, and after what his Royal Highness had said as to want of courtesy, undoubtedly they would now see improvement in that matter also.

Then there was the question of excessive noise, emanating sometimes from the vehicle, sometimes from the load. That also was a matter to which they frequently drew the attention of members. The enormous improvement in giant pneumatic tyres helped to eliminate noise, and vehicle owners could now rely upon them sufficiently for heavy loads. He thought that the majority of new lorries would be fitted with pneumatic tyres. It was a step in the right direction when the Chancellor of the Exchequer reduced the taxation on pneumatic tyred vehicles. So far as noise was concerned he supposed that the ideal would be a new lorry fitted with pneumatic tyres and with a load of collecting boxes from Aberdeen (loud laughter).



MR. GEO. MONRO, C.B.E., M.INST.T.
PRESIDENT.

THE TOLL OF THE ROAD.

There was a still bigger question, namely, the regrettably large number of accidents on our roads. The Council of the C.M.U.A. looked upon that as the most serious problem with which they were faced, and partly by the improvement of lorries with greatly increased braking powers, but principally by educating drivers in regard to their responsibilities towards other users of the road, they hoped to help greatly to reduce what were undoubtedly terrible losses. The Association realised their responsibility and were doing their utmost to decrease the toll of the road. Educational work should not stop at the motor driver, the pedestrian should be taught that it was his duty to look after himself and so help the motor users to avoid accidents.

THE PARTING OF THE WAYS.

We were witnessing the conversion of our roads from narrow and none too strong highways suitable only for the lighter loads of horsed traffic, into highways built to bear the greater loads and higher speeds of present day motor transport. Up to the present, road transport interests and railway interests had appeared to be antagonistic, yet he thought they were now at the parting of the ways. He felt that in the future they would see much more co-operation between the two systems. He visualised the time when the transport of both passengers and goods would be carried out on the railways' main trunk lines, and the country would be covered with a network of motor systems feeding those trunk lines.

He thanked his Royal Highness for handing him the Presidential Badge of the C.M.U.A. He accepted it as trustee for future Presidents. Not only did he honour the badge as a sign of the trust placed in him by his fellow members, but it had acquired a further honour in coming to them from the hands of the Prince (cheers).

In coupling his name with the toast his Royal Highness paid him the greatest compliment that could be paid to any man, he described him as an old friend of his, and said some flattering things about the work he had done. Perhaps he had been able to do a certain amount, but he did not think he could take much credit, as he had always found men willing to do the bulk of the work, leaving him the bulk of the credit (laughter).

The work of the C.M.U.A. could not have been carried out had it not been divided between a large number of people. There was the Finance Committee and a Council drawn from leaders of industry all over the country, and he would like to take that opportunity of paying tribute to the work of one who had done so much in the interests of the Association, Mr. F. G. Bristow (loud applause). The Finance Committee well knew the extraordinarily able way in which the Central office was run by Mr. Bristow, and he was quite sure there were many members who had cause to thank him for sound advice received and courteous assistance rendered on more than one occasion. He could say without fear of contradiction that no one realised the value of Mr. Bristow's work so fully as did the President and Past-Presidents of the Association (loud applause).

MR. E. S. SHRAPNELL-SMITH, C.B.E., Immediate-Past-President, proposing the toast of "His Majesty's Ministers," said that those responsible for the conduct of any branch of commerce were to-day confronted with many perplexities and difficulties, and they gathered from the speeches of members of the Government that they also were faced with difficulties, greater, perhaps, than those by which commerce was confronted. They hoped that His Majesty's Ministers would overcome the difficulties which our nation and all the nations of the world were called upon to face at the present time, and would secure a furtherance of international good will and peace, and so make the world not only safe for democracy, but what was more vital still, safe for civilisation.

THE RT. HON. LORD THOMSON OF CARDINGTON, P.C., C.B.E., D.S.O., Secretary of State for Air and President of the Air Council replying to the toast, said he had listened with great interest to the speeches and had noticed that emphasis had been laid on road transport. He rather felt that he represented a new development which was going to be of great service in the future. Road transport was suffering from congestion and he suggested that commercial motor users might take a little more to the air (laughter).

Air transport was on the move, and although perhaps it would be a long time before it competed with the C.M.U.A., in time it might even come to that.

He did want to focus attention upon the fact that the great question of transportation by any means was one which we could not neglect. There was an immense future before all forms of transportation, and he urged them to appreciate the fact that the incredible of to-day was the accomplished fact of to-morrow; to keep their eyes open and upon the ball.

MR. HERBERT MORRISON, M.P., Minister of Transport, responding with Lord Thomson to the toast, paid a tribute to the work of Mr. E. S. Shrapnell-Smith, C.B.E., one of the founders of the Association and its President from 1918 to the beginning of the present year. Mr. Shrapnell-Smith, he said, had not only played an important part in the development of the Association's policy, but his knowledge and co-operation had been of the greatest value to the Ministry of Transport and to the Government.

One of the most difficult, but nevertheless one of the most important, problems which faced him as Minister of

Digitized by Google

Transport, was that of the co-ordination of transport services. Railways, road transport, canal transport, coastwise shipping, air transport, all had their definite function to play.

Whatever the separate transport interests might think, he himself could do no other than consider the various forms of transport as a whole, and pursue a policy calculated to utilise all efficient means of transport to the maximum extent. Whether on the vexed question of London Traffic, the relation between road transport and rail transport, or otherwise, his policy as Minister of Transport was co-ordination, but always co-ordination consistent with the public interest.

It was very necessary in the interests of co-ordination, and in the interests of public safety, that the question of fresh motor legislation should be faced. He could not say how soon that legislation would be coming along, but he could say that the Government was anxious to pass it in the most public spirited and progressive way at the very earliest possible moment.

MR. C. LE M. GOSSELIN, President-Elect of the C.M.U.A., proposing the toast of "The Guests," said that the President had referred to the great pleasure they all felt at the gracious presence of his Royal Highness the Prince of Wales (cheers). It had been a great honour for the Association to entertain him, and a great pleasure to the members to come into contact with his engaging personality (applause).

MR. F. G. BRISTOW, F.C.I.S., M.INST.T. GENERAL SECRETARY.

They were honoured also with the presence of His Excellency Tsuneo Matsudaira, the Japanese Ambassador, Monsieur Chas. Blum, President, Union des Vehicules Industriels, France, the Rt. Hon. Lord Thomson of Cardington, Secretary of State for Air, and President of the Air Council, Mr. Herbert S. Morrison, M.P., Minister of Transport, and many other distinguished guests, and on behalf of the Association he extended to each and all a most hearty welcome.

HIS EXCELLENCY TSUNEO MATSUDAIRA, the Japanese Ambassador, and **MONSIEUR CHAS. BLUM,** President, Union des Vehicules Industriels, France, replied on behalf of the guests.

Amongst those present were:—Mr. H. H. Dieckhoff, the German Charge d'Affaires; Lt.-Col. S. S. Paddon, C.I.E. (representing the High Commissioner for India); Capt. the Rt. Hon. Earl Howe, P.C., C.B.E.; Lt.-Col. Lord Herbert Scott, C.M.G., D.S.O.; the Rt. Hon. the Viscount Brentford of Newick, P.C.; the Rt. Hon. J. R. Clynes, P.C., M.P. (Secretary of State for Home Affairs); Mr. Ben Smith, M.P. (Treasurer of His Majesty's Household); the Hon. Sir Arthur Stanley, G.B.E., C.B. (Chairman, Royal Automobile Club); Major Vivian B. Rogers, D.S.O. (Mayor of Westminster); Adr. Beers (Vice-President, Bond van Bedrijfsautohouders in Nederland); Mr. Ben Turner, O.B.E., M.P. (Parliamentary Secretary to the Mines Department, Board of Trade); Alderman Frederick Montague, M.P. (Under Secretary of State for Air); Sir Brodie H. Henderson, K.C.M.G. (President, Institution of Civil Engineers); Sir Thomas F. Purves, O.B.E. (President, Institution of Electrical Engineers); Col. the Master of Sempill, A.F.C. (President, Royal Aeronautical Society); Sir Josiah Stamp, G.B.E., D.Sc. (President, Institute of Transport); Sir Cyril W. Hurcomb, K.B.E., C.B. (Permanent Secretary, Ministry of Transport); Sir Joseph E. Petavel, K.B.E., D.Sc., F.R.S. (Director, National Physical Laboratory); Sir Henry P. Maybury, G.B.E., K.C.M.G., C.B. (Chairman, London and Home Counties Traffic Advisory Committee); Brig.-Gen. the Hon. Sir Newton J. Moore, K.C.M.G., M.P.; Rear-Admiral Sir Charles W. R. Royds, K.B.E., C.M.G., R.N. (Deputy Commissioner Metropolitan Police); Lt.-Col. Sir Hugh S. Turnbull, K.B.E., J.P. (Commissioner of Police for the City of London); Major-Gen. C. D. R. Watts, C.B., C.M.G. (Director of Ordnance Services, War Office); Major-Gen. Evan Gibb, C.B., C.M.G., C.B.E. (Director of Supplies and Transport, War Office); Major-Gen. S. S. Long, C.B. (President, Mansion House Association on Railway and Canal Traffic); Sir Henry O. D. Segrave; Squadron-Leader A. H. Orlebar, A.F.C.; Flying Officer H. R. D. Waghorn, A.F.C.; Sir Edward Manville, J.P. (Master of the Worshipful Company of Coach Makers and Coach Harness Makers); Mr. C. le M. Gosselin (President-Elect, C.M.U.A.) and Mr. F. G. Bristow, F.C.I.S., General Secretary, Commercial Motor Users' Association.

Licensing and Regulation of Public Service Vehicles.

Second Report of the Royal Commission on Transport.

THE second Report of the Royal Commission on Transport, appointed to consider the problems arising out of the growth of road traffic, has been published, and deals with the Licensing and Regulation of Public Service Vehicles. A summary of the first Report dealing with the Control of Traffic on Roads was printed on pages 569 and 570 of our August issue.

A considerable volume of evidence remains to be taken before the Commissioners will be in a position to present their third and final Report, which will deal with the question of the general co-ordination and development of all available means of transport.

"In our First Report," the Commissioners state, "we comment upon the fact that the statute law relating to mechanically propelled vehicles is, in many respects, out of date, but however obsolete the law in this behalf may be, that in regard to the licensing of public service vehicles is archaic."

For the purposes of the second Report, the Commissioners have adopted the following definitions of public service vehicles and of the three classes (viz.: stage carriages, express carriages, contract carriages) into which those vehicles are divided in the Draft Road Traffic Bill (Clause 50). The definitions follow those contained in the published Bill with the exception of the substitution of the word "six-pence" for the word "three-pence" in (ii) and (iii).

Definitions:—

(i) Public service vehicles; that is to say, motor vehicles (other than tramcars and trolley vehicles) used for carrying passengers for hire or reward.

This is the general definition. Those which follow are the classes into which public service vehicles are divided.

(ii) Stage carriages; that is to say, motor vehicles carrying passengers for hire or reward at separate fares (any or all of which are less than sixpence), stage by stage, and stopping to pick up or set down passengers along the line of route, and any other motor vehicles carrying passengers for hire or reward at separate fares and not being express carriages as hereinafter defined;

(iii) Express carriages; that is to say, motor vehicles carrying passengers for hire or reward at separate fares and for a journey or journeys to some one or other common destination specified beforehand, and not stopping to take up or set down passengers other than those taking the specified journey or journeys, and motor vehicles carrying passengers for hire or reward at separate fares, where no fare is less than sixpence;

(iv) Contract carriages; that is to say, motor vehicles carrying passengers for hire or reward under contract expressed or implied for the use of the vehicle as a whole at or for a fixed or agreed rate or sum;

Provided that a motor vehicle adapted to carry less than nine persons shall not be deemed to be an express carriage by reason only that on special occasions it is used to carry passengers at separate fares.

The Commissioners wish to make it clear that their recommendations are not intended to apply (i) to contract carriages adapted to carry less than nine persons, or (ii) to tramcars and trackless trolley vehicles which do not come within the scope of their Report as they are operated under statutory powers and do not require to be licensed, or (iii) to the London Traffic Area which is subject to the provisions of the London Traffic Act, 1924.

In spite of the fact that there are more than 1,100 licensing authorities in England and Wales, the licensing laws, such as they are, do not apply throughout the whole of the country. The need for comprehensive legislation which would apply uniformly was evident, but apparently lack of Parliamentary time prevented the introduction of such legislation. The Commissioners hope that the new Parliament will find the necessary time without delay.

The Commissioners are satisfied that the need for a new code of laws is as great in Scotland as in England and Wales.

PROPOSALS OF THE COMMISSION.

The Commissioners state that they could not fail to observe that the majority of the Witnesses advocated the division of the country into large areas for licensing purposes with a view to obtaining a proper control and co-ordination of road services and as a result of their deliberations have unanimously come to the definite conclusion that, as modern road passenger transport has grown to such importance, the

Digitized by Google

present chaotic system of licensing must disappear and be replaced by an entirely different system more suited to present-day needs.

One objection to the present system is that many local authorities are themselves owners and operators of transport, and although no definite cases of unfair discrimination had been put before the Commissioners, there could be no doubt that, when functioning as licensing authorities, their actions were suspect to many of their competitors. The Commissioners consider that it is undesirable that a judge should be open to suspicion on the ground that he is interested in an organisation that may be in rivalry with the applicant.

The Commissioners wish it to be clearly understood that, so far as this Report is concerned, the recommedations are not intended to apply to the London Traffic Area; they do not wish it to be understood, however, that they are satisfied with the present condition of affairs in London and they cannot help thinking that some such plan as they suggest for the rest of the country should, *mutatis mutandis,* be applied to London.

TRAFFIC AREAS.

A reference to the suggestions which have been made to the Commissioners shows clearly that the principle of the establishment of traffic areas is generally acceptable.

The Commissioners are in complete agreement with the principle of large traffic areas—indeed, they fail to see any other practical and satisfactory alternative—and they recommend that for the purposes of the licensing of public service vehicles and the co-ordination of all passenger-carrying services, Great Britain shall be divided into Traffic Areas, and without precisely delimiting the actual areas which should be prescribed, it is suggested that there should be ten in England and Wales, and four in Scotland.

The delimitation of the areas which are ultimately fixed should form part of the Bill necessary to give effect to the recommendations, subject to power being given to the Minister to vary or adjust the boundaries after holding an Inquiry, where experience may show that variation or adjustment is desirable.

The Commissioners state that as a general principle they fully recognise the desirability of local authorities having, so far as practicable, control within their areas of all matters affecting the public interest of the community, and they are reluctant to make any recommendation which may appear to run counter to this principle. In regard, however, to the question of the licensing of public service vehicles they have been irresistibly driven to the conclusion that in the present day conditions of road passenger transport services, effective control, regulation and co-ordination cannot be secured by the retention of even the larger authorities as the licensing bodies. On the other hand, they are satisfied that local authorities should retain powers enabling them to exercise a very considerable control over the public service vehicles passing through their districts.

"This brings us 'the Commissioners state,' to the proposals made by the Transport and General Workers' Union and by the London and Provincial Omnibus Owners' Association. Each of these bodies, although approaching the problem from different angles, suggested the division of the country into large transport areas, and each proposed the appointment of a Commissioner or Commissioners in these areas. It is true that in detail the suggestions differed, but in principle they were identical. We believe that the only satisfactory solution will be found in the adoption of this principle, and it is for this reason that we now make our second main recommendation, namely, that for the purposes of the licensing of public service vehicles and the co-ordination of all passenger-carrying services, three Commissioners should be appointed in each Traffic Area."

While proposing to take away from local authorities the right to license, the Commissioners propose to leave to them the power to make regulations as to stands and stopping places and the routes to be followed within their districts.

APPOINTMENT OF AREA COMMISSIONERS.

The Commissioners recommend that the three Commissioners in each Traffic Area should be appointed by the Minister of Transport. The Chairman should be appointed direct, and should be a whole-time paid officer. He should hold office for such term not exceeding seven years as may be determined at the time of his appointment and then retire, but should be eligible for reappointment. The other two Commissioners, though they should have equal status with the Chairman, should not be whole-time officers, but might receive such remuneration, if any, and expenses as the Minister may determine. They should hold office for such term not exceeding three years as may be determined at the time of appointment, and then retire, but should be eligible for reappointment. In the case of these two Commissioners it is recommended that there should be some consultation on the part of the Minister with the principal local authorities before they are appointed. This consultation might take place in either of two ways. First, the Minister might consult with such body or bodies as he may consider most representative of County Councils, and county borough and borough councils respectively. Alternatively, two panels might be constituted in each Traffic Area, and the Minister might select one person from each panel for appointment as Commissioner. The first panel might consist of persons nominated by the County Councils in the Area, and the second of persons nominated by the Councils of the county boroughs and boroughs in the Area—each Council having the right to nominate one person. In neither case do the Commissioners suggest that any person so nominated should necessarily be a member of the nominating Council. A person nominated should, it is thought, remain on the panel for three years, and at the end of that period the nominating Council should have an opportunity to change or reappoint its nominee as it might think fit.

While not desiring in any way to fetter the discretion of the Minister in this matter, the Report expresses a preference for the second alternative, which appears to them to be the more satisfactory.

DUTIES AND FUNCTIONS OF AREA COMMISSIONERS.

As it is considered that the Commissioners should be made responsible for the co-ordination of all passenger-carrying services (including tram and trackless trolley services) within their respective areas, the Report expresses the opinion that the fullest powers should be conferred upon them in order that they may be in a position to carry out these duties effectively.

The Report recommends that:—

(i) The Commissioners shall be within their respective Areas the sole authority for licensing public service vehicles constructed or adapted to carry nine or more persons and also for licensing the drivers and conductors of these vehicles. For the latter purpose the Commissioners should be empowered to make suitable arrangements, if they think fit, with local authorities.

(ii) The Commissioners shall be required to give reasonable notice to the Commissioners of any other Area or to any local authority of any application which may affect such other Area or local authority.

(iii) For the purposes of considering applications for licences and the "backing" of licences granted in another Area, the Commissioners shall sit in public at convenient stated dates and places.

(iv) The Commissioners shall have discretion to hear and consider representations from persons other than applicants, but it shall be their duty to hear and consider any representations which any local authority, passenger transport undertaker, or other body or person directly interested in or affected by the proposed service may desire to make, unless the Commissioners consider such representations to be frivolous.

(v) The Commissioners shall have power to grant or refuse to grant any licence and to "back" or refuse to "back" any Route Licence granted by the Commissioners of another Area. In granting or "backing" a Route Licence the Commissioners shall have power to attach reasonable conditions to such licence. In coming to a decision upon any application, the Commissioners shall act judicially and shall have regard to the following considerations:—

(*a*) The traffic needs of the whole Area.

(*b*) The provision of adequate and efficient services throughout the Area.

(*c*) The elimination of unnecessary services.

(*d*) The provision, where possible, of services on routes which in themselves are unremunerative.

(*e*) The co-ordination of all forms of passenger transport in the Area, *e.g.* the provision of motor omnibus services to extend and feed tramway and trackless trolley systems rather than to compete with them, and the co-ordination of road and rail services.

(vi) The Commissioners shall cause the time-tables of all regular services to be submitted to them, and shall satisfy themselves that such time-tables are so arranged as to provide the public with adequate facilities at convenient hours and in such manner that the legal maximum speed limit for the vehicles used will not be exceeded.

(vii) The Commissioners shall satisfy themselves that the fares charged or proposed to be charged are reasonable and, if representations have been made to them and if they consider it necessary in the public interest, may, after holding a public enquiry, fix maximum and minimum fares for any service in their Area.

(viii) Generally, the Commissioners shall aim at establishing an adequate passenger transport service in their Area, creating what has been termed by several Witnesses a "controlled monopoly," *i.e.,* the provision of services by an adequate number of efficient undertakings which, for the safeguarding of the interests of the public, would be subject to strict control.

(ix) The Commissioners shall submit an Annual Report to the Minister.

Digitized by Google

OTHER RECOMMENDATIONS.

Other recommendations include:—

Expenses of Commissioners.—The expenses of Commissioners should be met partly from the proceeds of fees for licences. Any deficiency should be met from the Road Fund.

For a Public Service Vehicle Licence, a fee not exceeding £2 2s. should be charged in respect of each vehicle. Route Licences and licences for drivers and conductors should be issued at nominal fees, say, 5s. per licence.

Powers of Local Authorities.—Powers should be given to all existing licensing authorities, and to all County Councils to which this Report relates, to make regulations regarding the routes, stands, and stopping places of public service vehicles. These regulations should not become operative unless confirmed by the Minister after consultation with the Area Commissioners, and should have force only within the area of the authority making them. No alteration should be made in the existing law relating to the licensing of public service vehicles constructed to carry less than nine persons (mainly taxicabs) or the drivers of these vehicles.

Classification of Vehicles. — Public service vehicles should be defined as "motor vehicles (other than tramcars and trackless trolley vehicles) used for carrying passengers for hire or reward." They should be classified as "stage carriages," "express carriages" and "contract carriages"—the first representing the ordinary omnibuses carrying passengers for short stages; the second, the long-distance coaches carrying passengers at separate fares; the third, the vehicles which are hired as a whole.

Certificates of Fitness.—Before a Public Service Vehicle Licence is granted, the applicant should be required to produce a Certificate of Fitness, implying that the vehicle complies with the constructional requirements prescribed by the Minister of Transport.

The Commissioners should appoint properly-qualified Certifying Officers to examine vehicles and issue Certificates of Fitness. A Certificate of Fitness should normally be valid for a period of five years, but provision should be made for re-examination of the vehicle within that period, if circumstances render it desirable.

Public Service Vehicle Licences. — It should be an offence to use a vehicle as a stage carriage or as an express carriage or as a contract carriage, if it is not licensed as a vehicle of that class, provided that a vehicle licensed as a stage carriage may be used as an express carriage or as a contract carriage, and one licensed as an express carriage may be used as a contract carriage.

Area Commissioners, however, should be given a limited discretion to authorise, in certain circumstances, the use of an express carriage as a stage carriage.

Public Service Vehicle Examiners.—The Commissioners should appoint Public Service Vehicle Examiners for the purpose of inspecting licensed vehicles and ensuring that they are satisfactorily maintained. Public Service Vehicle Examiners should have power to stop and inspect vehicles at any time, and if on inspection it appears that the vehicle, owing to defects, is or is likely to become unfit for service, they should have power to suspend the Public Service Vehicle Licence in respect of the vehicle.

Route Licences. — A vehicle should not be used as a stage carriage or as an express carriage unless the operator is the holder of a Route Licence. In the case of a service of stage carriages passing through the areas of more than one licensing authority, the Route Licence should be required to be endorsed or "backed" by the Commissioners of each Area other than those who originally granted the licence. In the case of a service of express carriages such "backing" should only be required in Areas in which passengers are taken up and set down.

Conditions attaching to Route Licences. — The Commissioners should have power to attach such conditions to Route Licences as will secure:—(*a*) the provision of suitable services; (*b*) the route to be followed; (*c*) the suitability of the vehicles for the route; and (*d*) that fares shall not be unreasonable having regard to all the circumstances.

The Commissioners should also be empowered to attach conditions relating to hours, wages and conditions of service.

Suspension and Revocation of Route Licences. — The Commissioners should be empowered to revoke or suspend a Route Licence or the "backing" of such licence either for non-compliance with any condition subject to which the licence was granted or "backed," or in the event of the conviction of the holder of certain specified offences.

Applications for Licences. — Applications for Public Service Vehicle Licences and Route Licences should be made to the Commissioners of the Area within or through which the vehicle is intended to be operated or the service is intended to start, or, in the case of a vehicle intended to run or a service to be operated between two terminal points, to the Commissioners of the Area in which either point is situated.

Duration of Licences.—Unless suspended or revoked in the meantime, a Public Service Vehicle Licence or a Route Licence should continue in force for one year, but the Commissioners originally granting the licence should have power to renew it from time to time for further periods of one year. Route Licences should expire on a prescribed date in each year but, if thought desirable, a licence may be limited to a certain period of the year.

Notices regarding "Backing" of Licences. — Commissioners who "back" or refuse to "back" a Route Licence should be required to give notice of the fact to the Commissioners by whom the licence was granted, and, if a licence is "backed" subject to conditions, notice of such conditions.

Transfer of Licences.—Neither a Public Service Vehicle Licence nor a Route Licence should be saleable or transferable in any circumstances whatsoever.

Appeals.—An applicant should have a right of appeal against a decision of the Commissioners to a Court of Summary Jurisdiction in the case of a driver's or conductor's licence, and to the Minister of Transport in the case of any other licence. No licence regarding which an appeal is pending should become operative until the appeal has been decided.

Regulations by the Minister.—The Minister of Transport should have power to make regulations regarding such general matters in connection with licensing (*e.g.*, the prescription of standard forms of licences) as will secure uniformity in the various Areas. He should also have power to make regulations as to the conduct of passengers, the conduct of drivers and conductors when acting as such, and as to such general matters as the fees payable for licences, the marks to be carried by vehicles and the badges to be worn by drivers and conductors.

Drivers and Conductors. — All drivers and conductors should be licensed as such. The grant of such licences should be restricted to persons over the age of twenty-one in the case of a driver, and over the age of eighteen in the case of a conductor.

Time-tables. — The Commissioners should have power to require all time-tables to be submitted to them for approval and that, when approved, the appropriate time-table should be displayed inside the vehicle.

Accidents. — It should be the duty of a holder of a Public Service Vehicle Licence to give notice of any accident to or failure of the vehicle which may affect the safety of passengers or others. A Public Inquiry by the Minister should be obligatory in the case of all accidents to public service vehicles which involve the death of a passenger, or of a driver or conductor or other employee of the operator.

Insurance.—Insurance in respect of damage to person or property should be made obligatory in the case of all public service vehicles. The exemption proposed in the Draft Road Traffic Bill, in the case of proprietors who satisfy the licensing authority of their financial ability to meet all such claims as may be made against them, should be carefully reconsidered.

Belgium's Wembley.

THE British Empire's most spectacular exhibit since Wembley is being organised by the Department of Overseas Trade as part of the International, Colonial and Maritime Exhibition to be held in Antwerp next year (1930) in celebration of the Treaty of Belgian Independence—the Treaty in defence of which Great Britain went to war in 1914. The British Treasury has sanctioned an expenditure of £100,000 on the exhibit. "The British section has been allotted such a good position that it will be a predominant feature of the Exhibition," said an official of the Department on returning from Antwerp. "The building has been designed by Sir Edward Lutyens." New Zealand is to have a prominent position in the British section; South Africa is considering plans; the Straits Settlements, the Gold Coast and the East African Dependencies have all asked for space to be reserved. Ceylon is considering joining and other possible exhibitors include the Irish Free State and Palestine. The most important British shipping companies are to have displays in the British section. Other exhibitors will be allotted places either there or in the international section, according to the amount of space available. Manufacturers of equipment for ships, of course, will be specially invited to exhibit.

Commercial Motor Transport Exhibition.

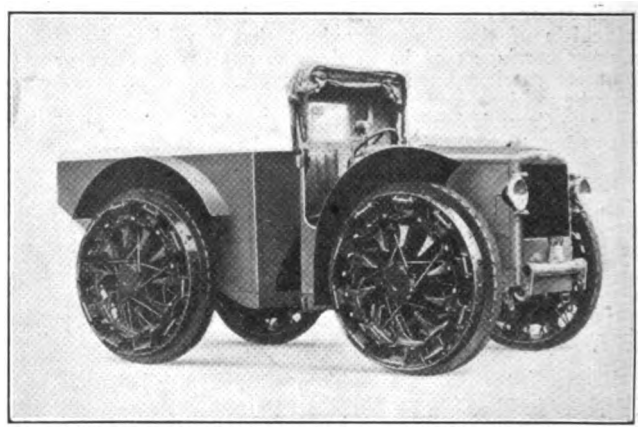
Olympia, November 7th to 16th.

WE have pleasure in presenting to our readers what we claim to be a practically complete report of exhibits at the Olympia Show. It is true that some few firms sent us the particulars of their exhibits too late for inclusion or failed to send them at all, but with these exceptions our readers may regard the report as substantially complete.

Commercial Motor Vehicle and Body Work Section.

Albion Motor Car Co., Ltd., Glasgow. Stand No. 45. This firm, one of the pioneer firms in the industry, are showing a comprehensive selection from their wide range of goods and passenger models. There are three machines on the Albion stand which are new models since last Olympia, but there is nothing which has not been on the market long enough to have won its spurs in the hands of the public. The exhibit consists of six machines, three for passenger work, and three for goods carrying. A centre of interest will, no doubt, be the 24-passenger "Viking Six" sunshine saloon, built to the order of the L.M.S. Railway. The "Viking Six" chassis is well known to coach operators, many of whom have had experience of its performance in actual service. The engine with a bore of 3⅛ in., and a stroke of 5 in., is rated at 36 h.p., but develops 90. The clutch is the single plate type with an efficient clutch brake. There are four forward speeds and a divided propeller shaft with a self-aligning centre bearing. The rear axle is of the underslung worm type, and is the subject of a number of patents. The footbrake operates through Dewandre vacuum servo gear on all four wheels, and the hand brake on entirely independent shoes in the rear wheel drums. The bodywork carried out by Messrs. P. W. Watson and Sons, Ltd., of Lowestoft, is built to conform to the Manchester and Rochdale Corporation regulations. The second passenger machine is a 32-seater service bus mounted on a six cylinder chassis, generally similar to that used for the L.M.S. Railway machine, except that it is of the overtype design. The driver's seat has been considerably lowered since the introduction of this chassis a year ago. The body was built by Messrs. Strachans with the usual jack-knife door. The other passenger machine is a 30/60 h.p. 4-cylinder overtype front entrance bus for the fleet of W. Alexander & Sons, Ltd., of Falkirk, who are also the builders of the body. The chassis is a type which has been on the market for some years and figures in the fleets of many large operators throughout the country. The body is designed for fairly long distance "limited-stop" work, and is fitted with single type bucket seats arranged in pairs, slightly staggered to give the maximum of comfort to passengers. In order to provide extra leg-room, the seating has been reduced to 30 instead of the 32 which the body could accommodate. The interior is finished in mahogany, and has an excellent appearance. Turning now to the goods models, an exhibit sure to attract much attention is the high-speed 30-cwt. model, which is making its initial appearance at Olympia. It has been on the market about a year, and is to be found on the fleets of many of the most famous transport users in the country. It is shown as a polished chassis. The engine and gear box are built as a unit, but the clutch pit is open so that adjustment is simple. The R.A.C. rating is 19.6 but the power actually developed is nearly double this figure. The cylinders and crankcase are a single casting; the head is detachable with the valves at the side; the inlets being of the Ricardo masked type. The induction pipe is heated by an exhaust jacket. The magneto on the offside and the water pump on the nearside are driven from a cross shaft and are thus placed where adjustment or inspection is easy. The oil filler also is large and well placed. The gear box, which provides four forward speeds, has short, rigid shafts and large bearings. The drive to the back axle is by an open tubular propeller shaft with large fabric universal joints. The rear axle is of the overhead worm drive type, and provides adequate clearance for use overseas, the 4 ft. 9 in. track being another feature appealing to users abroad. Owing to the forward position of the steering box the drag link articulation is so good that there is almost entire freedom from steering wheel "kick" on rough going. The brakes are all on the rear wheels, the adjustments being very accessibly placed outside the frame on each side. The chassis is marketed complete with a 12-volt 5-lamp C.A.V. lighting set, and speedometer, and spare wheel with solid tyre, the latter being interchangeable with either the 33 in. by 5 in. or the 34 in. by 7 in. wheels fitted as standard to front and rear axles respectively. While this chassis is designed for 30 cwt. loads it is equally serviceable for a 16-seater body. The next exhibit is a 3-ton van, the latest addition to the large fleets of Albions owned by J. Lyons & Co., Ltd. The chassis is the well-known 30/45 h.p. model, and is mounted on 34 in. by 7 in. pneumatics. The body built by The Normand Garage, is specially designed for carrying trays, no less than 81 being accommodated. Finally, there is an imposing looking 5-ton overtype tilt van for the use of the Navy, Army and Air Force Institute who already have 47 Albions in their fleet. The 35/55 h.p. engine is well up to its work, and has an excellent reserve of power to cope with heavy going. The tyre equipment is 36 in. by 8 in. pneumatics singles front, twins rear, and the footbrake operates through vacuum servo gear. The Albion stand is one that will well repay careful examination by both goods and passenger vehicle operators.

Armstrong Siddeley Motors, Ltd., Parkside, Coventry. Stand No. 39. This firm is to exhibit a novel type of four wheel drive tractor. It has a four cylinder air cooled engine and the drive is taken through a four-speed gear box to all four wheels. The chassis is built in two halves, joined together by a tubular member, at each end of which is a vertical pivot, around which each frame can turn both horizontally and vertically. Each frame has a dead axle which carries the driving wheels. To each frame also is attached a cross-shaft casing through which the cardan shafts transmit the drive to the driving wheels. There is also to be a four wheel drive reconnaissance car which differs to the foregoing in that it has a lighter frame and the wheels are shod with pneumatic tyres instead of solids.

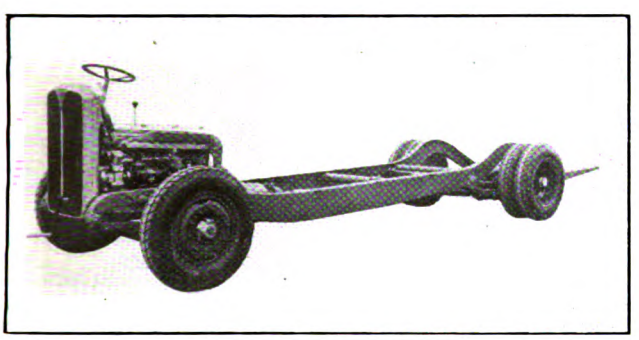


THE ARMSTRONG-SIDDELEY (PAVESI TYPE) 45 H.P. 4-CYLINDER FOUR WHEEL DRIVE TRACTOR.

Associated Equipment Co., Ltd., Windmill Lane, Southall, Middlesex. Stand No. 71. This firm's exhibits will comprise a "Regent" double-deck bus, a "Regal" single-deck bus and a "Regal" show finished chassis, each fitted with a 95 h.p. A.E.C. engine, also a "Majestic" 6-ton float lorry sold to the Cement Marketing Company, and, finally, a 95 h.p. show finished engine shown as a working model. The following is a brief description of the engine:—95 h.p. six cylinder, overhead camshaft engine, 100 m.m. bore by 130 m.m. stroke. Detachable head, automatic advance, magneto ignition, Solex carburetter, A.C. air cleaner, pump water circulation, force lubrication to all main and big end bearings. Fan and dynamo are positively driven by timing chains, no belts being used. The crankshaft has seven bearings 2¾ in. in diameter. The h.p. developed is 48 b.h.p. at 1,000 r.p.m., and 95

Digitized by Google

b.h.p. at 2,500 r.p.m. All accessories, such as dynamo, carburetter, magneto, oil filler, water pump and sparking plugs are accessibly mounted on the near side of the engine. In addition to a large gauze filter, a felt filter is provided to remove all small particles of dust from the oil. The filter is readily detachable from the bottom half of the crankcase and is kept under an oil pressure from the oil pump. This engine is fitted to both the "Regent" and "Regal" chassis and the following chassis details apply also to both models. The radiator, which is of distinctive design, is mounted to the engine at three points only and is insulated therefrom by rubber blocks. The clutch is a single plate 16 in. in diameter provided with an adjustable clutch stop. The four-speed gear box is of unit construction with engine casing, but can be dismounted without disturbing the engine. The gear ratios are: 1st, 4.37 to 1; 2nd, 2.69 to 1; 3rd, 1.95 to 1 and 4th, direct. The rear axle reductions, standard in both chassis, are 6¼ to 1. The change speed control operates through a single rod mounted on spherical bearings in the gear box and in an oil tight case clamped to the side of the engine. Power is transmitted through a tubular propeller shaft with Spicer couplings and a self-aligning ball bearing midway between the gear box and back axle. The rear axle is of the off-set type permitting low floor height. The axle is a one-piece nickel stamping, the underslung worm being carried in an electron metal housing. Foot brakes operate on all four wheels through vacuum servo mechanism; the hand brake operates on the two rear wheels only. Steering is of the Marles type. The front springs are 4 ft. 2 in. in length and the rear 5 ft. 2 in. Shock absorbers and rubber buffers are also provided. A 45-gallon petrol tank is mounted on the off-side frame member from which the



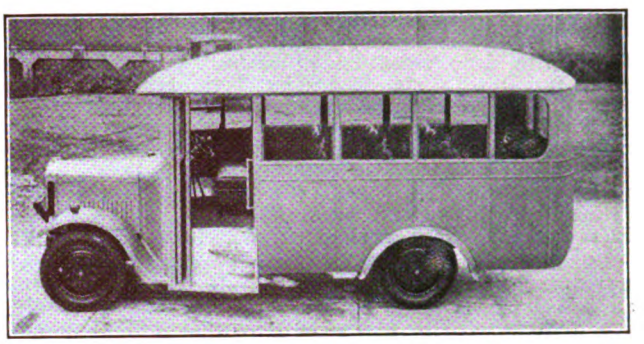
THE A.E.C. "REGENT" CHASSIS.

supply is drawn by an Autovac containing a 3-gallon reserve tank, mounted on the body bulkhead. The wheels are detachable disc with standard tyre equipment 36 in. by 8 in. single front and 38 in. by 9 in. balloon tyres rear, in the case of the "Regent" model, and 38 in. by 8¼ in. balloon tyres single front, twin rear, in the case of the "Regal" chassis. Central chassis lubrication has been adopted. The "Regent" chassis dimensions are as follows:—Wheelbase 15 ft. 6½ in., track 6 ft. 4 in. front, 5 ft. 10¼ in. rear, overall length 24 ft. 11 in., width 7 ft. 6 in., height of frame, loaded, 1 ft. 9 in., turning circle 57 ft., chassis weight 3 tons 5 cwt. In the case of the "Regal" they are similar to that of the "Regent" excepting a 17 ft. wheelbase, overall length 25 ft. 9 in., or alternatively 27 ft., turning circle 60 ft., chassis weight 3 tons 3 cwt. With regard to the "Majestic" it has been designed as a high-speed goods carrying vehicle and can be supplied with alternative axle ratios. It is fitted with a 110 h.p. six cylinder engine, similar in design to the 95 h.p. model. The radiator, clutch and gear box are also similar. The rear axle is the fully floating type carrying the double reduction and differential in a separate steel case. Both spur and bevels are of the helical type. Foot brakes are on all four wheels, servo operated; hand brakes on rear wheels only. Steering is the Marles types.

Austin Motor Co., Ltd., Longbridge Works, Birmingham. Stand No. 38. The exhibits will be as follows:—(1) An ambulance body mounted on a 20 h.p. six cylinder long wheelbase Austin chassis, providing accommodation for two stretchers and for a nurse or attendant and four sitting cases. Price £720 complete or £405 chassis only. (2) Another ambulance body mounted on a 12 h.p. chassis accommodating one stretcher case, two sitting cases and an attendant. Price £445 complete or £187 10s. chassis only. (3) A 12 h.p. "Special" traveller's brougham. Price £345 complete, £187 10s. chassis only. (4) Also two delivery vans mounted on the Austin 7 h.p. chassis.

John C. Beadle, Ltd., Spital Street, Dartford. Stand No. 61. This well-known body building firm will exhibit (1) a 26-seater luxury long distance saloon coach mounted on a six cylinder Thornycroft "BC Forward" chassis, (2) a 20-seater all-weather domed back coach mounted on a Morris Commercial "Y" type six cylinder chassis, (3) a box van mounted on a 50 cwt. Dennis chassis and (4) a special brewers' body mounted on a Leyland 6-ton Buffalo chassis.

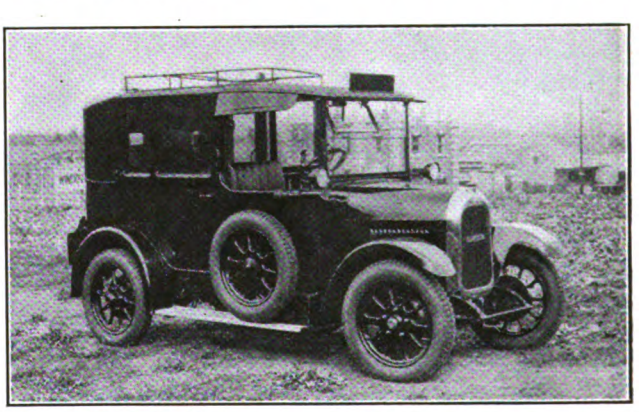
Bean Cars, Ltd., Tipton, near Birmingham. Stand No.



THE BEAN 16/17-SEATER BUS.

132. (1) A 30 cwt. lorry with hinged sides and tailboard. The chassis has a four cylinder engine 75 m.m. bore by 130 m.m. stroke, single dry plate clutch, four speed gear box and overhead worm driven rear axle, disc wheels fitted with 32 in. by 6 in. s.s. tyres, expanding brakes on rear hubs, chassis weight 28 cwt., load capacity 42 cwt. including body. Price complete £365. (2) A similar chassis fitted with an 18/20 seater bus body, 34 in. by 7 in. tyres, six drop windows, interior lighting, finished in red and white. Price £600. (3) A similar chassis fitted with a 16/17 seater Scotland Yard type bus body by Birch Bros. Price £645 complete. (4) A 25 cwt. van with engine similar to the above. This chassis has a spiral bevel final drive, disc wheels with 33 in. 5 in. s.s. tyres, chassis weight 27 cwt. Smith 12-volt five-lamp lighting set and self-starter. Price £340. (5) A 50 cwt. "Empire" long wheelbase chassis as fully described in our September number. Price £595. (6) A similar chassis fitted with a lorry body with hinged sides and tailboard. Price £665.

Beardmore Taxicab Co., Ltd., 112 Great Portland Street, London, W.1. Stand No. 69. There will be two examples of the new standard "Hyper" taxicab with standard body-work, one being red and one blue. The body work will be new to taxicabs having sun or shade sliding roof.



THE BEARDMORE "HYPER" TAXICAB.

Another special feature is that the engine is provided with Ricardo patent head and patent duplex induction manifold, providing rapid acceleration and economy in fuel. Also the chassis will be fitted with four wheel brakes, safety glass and frameless windows.

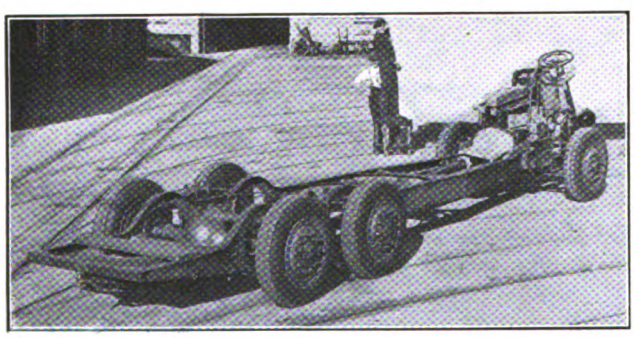
Berliet Motor & Engineering Co., Ltd., Richmond Bridge Works, Twickenham. Stand No. 137. (1) A 20 h.p. 2-ton four cylinder chassis with four speed gear box unit with engine, central control, multiple dry plate clutch, overhead worm rear axle, Servo assisted four

Digitized by Google

wheel brakes, Michelin wheels with 835 by 135 m.m. pneumatic tyres, twin rear. The chassis will be fitted with a drop sided body. Chassis price £345, with body £410. (2) A 22.3 h.p. 3-ton four cylinder chassis, particulars as above excepting engine, 95 m.m. bore by 130 m.m. stroke, four cylinders in 2 blocks; pneumatic tyres 855 by 155 twin rear. Price £485. (3) A 30 h.p. 5-ton tipper with four cylinder governed engine, 110 m.m. bore by 140 m.m. stroke. Four speed gear box, multiple dry plate clutch, central control, chain drive rear axle, solid tyres 950 by 140 front and 1030 by 160 twin rear fitted with metal body and end tipping gear worked from the gear box. Chassis price £595, with body complete £750. (4) A similar chassis with a Wood hydraulic tipping body. Price £795. (5) A similar chassis but with long wheelbase 17 ft. 4 in., fitted with drop sided body. Chassis price £625 with solid tyres, with six 38 in. by 7 in. pneumatic tyres £62 10s. extra. Price complete as shown £710. (6) A 30 h.p. 4/5 ton live axle chassis with double reduction rear gear and Servo assisted four wheel brakes, solid tyres. Price £765, or as shown with 38 in. by 7 in. pneumatic tyres, twin rear, £827 10s. (7) A 45 h.p. 10/12 ton six cylinder tractor unit. Price £795 and (8) a 45 h.p. 10/12 ton six cylinder rigid six wheeler. Price **£1,100.**

Bonallack & Sons, St. George Works, Cable Street, London, E.1. Stand No. 28. (1) A box van mounted on an A.E.C. 3½-ton "Mercury" chassis. (2) An all-weather coach mounted on a Vulcan "Duchess" six cylinder chassis. The body will have a "Sunsaloon" head, opening 12 ft. 6 in. by 4 ft. 10 in. Panelled throughout in aluminium with luggage compartments at each side and at rear. Coach doors fitted with recessed handles and heavy slam locks. Luxurious seats with extra deep cushions, upholstered in Moquette and an occasional table between the transverse seats. Fittings include three large roof lights, flambeaux on all pillars, ash trays and rug rails, all fittings and windscreen are heavy chromium plated. Finished in polished aluminium and with seats for 24 passengers.

Bristol Tramways and Carriage Co., Ltd., Tramways Centre, Bristol. Stand No. 136. There are to be three new models exhibited on this stand as follows:—(1) A six-wheel chassis design to take a 60-seater double-deck omnibus body, this is the half-bonnet type with engine developing 110 b.h.p. (4½ in. bore by 5½ in. stroke). Foot brake on all six wheels, hand brakes on four wheels, front springs fitted with Bristol patent load-adjusting device, chassis weight 4 tons 15 cwt. Electric self-starter, automatic impulse starter, Bristol rubber buffer vibration absorbing body mounting attachments. (2) A six cylinder four wheel light passenger chassis designed to take a body not exceeding 30 cwt. to seat up to 32 passengers. Half-bonnet type, six cylinder engine, 4 in. bore by 5 in. stroke, developing 78 b.h.p. Four wheel brakes. Chassis weight complete 3 tons 13 cwts., 16 ft. wheelbase, self-starter. (3) A six wheel electric trolley bus chassis to seat 60 passengers. (4) A Bristol 32-seater Superbus with 75 b.h.p. engine.



THE "BRISTOL" 6-CYLINDER SIX WHEEL PASSENGER CHASSIS.

British Longframe Six Wheeler Co., Ltd., 23 Tavistock Square, London, W.C.1. Stand No. 86. The exhibit will consist of a 20-seater one man operated saloon bus mounted on a standard 30 cwt. Chevrolet Longframe rigid six-wheel chassis. The overall length is 21 ft. 2 in., width 7 ft., height 8 ft. 6 in. The seats can be arranged to suit customers requirements.

British Mercedes-Benz, Ltd., Kings House, 37 Davies Street, Grosvenor Square, London, W.1. Stand No. 29. (1) A type N.K.56 chassis fitted with six cylinder 70 h.p. crude oil engine. Loading capacity 10 tons, chassis weight 5 tons; 42 in. by 9 in. pneumatic tyres. Three-way Miller tipping gear. Price of chassis complete with tipping gear, platform body, etc., £2,245. (2) Type N.46 special omnibus low frame chassis with 50/55 h.p. six cylinder engine. Loading capacity 3 tons 5 cwt. Chassis weight 2 tons 1 cwt., tyres 32 in. by 6 in. Price £675. (3) Similar chassis to above fitted with a 20 seater Coupe de Ville coach by Mumfords. Chassis price £675. Price of complete vehicle £1,250. (4) A Mercedes-Benz crude oil engine type O.M.26, engine only.

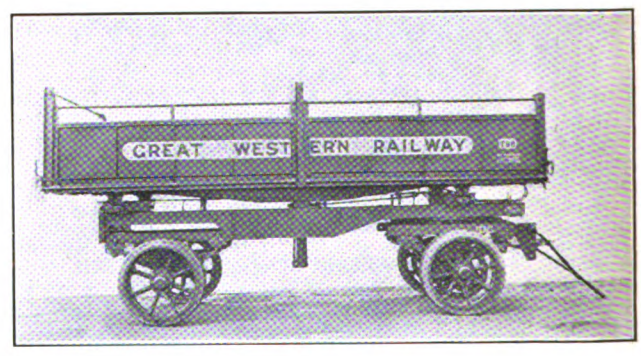
J. Brockhouse & Co., Ltd., Victoria Works, Hill Top, West Bromwich. Stand No. 90. The exhibit will consist of "Gibson" all-steel trailers of 10 cwt. and 6 cwt. capacity.

Bromilow & Edwards, Ltd., Engineers, Foundry Street, Bolton. Stand No. 81. The subject of the exhibit will be the firm's well-known tipping gears and bodywork, and in this connection there will be exhibited (1) a Leyland "Hippo" 6 wheel chassis fitted with hydraulic three-way tipping gear and bodywork specially designed for speedy discharge of 12/14 tons. (2) A Guy 6-ton four wheel chassis fitted with hydraulic three-way tipping gear and body work for general contractors use.

Brush Electrical Engineering Co., Ltd., Falcon Works, Loughborough. Stand No. 22. (1) A single-deck saloon bus body with front entrance providing seating accommodation for 30 passengers. This body will be mounted on a Leyland "Lion" 4 type chassis. The body is built to registered designs of the British Electrical Federation, Ltd. (2) A double-deck top covered bus body seating 50 passengers. This body will be mounted on a Crossley six cylinder 38/110 h.p. chassis with forward steering. A special feature of this bus will be the improved system of ventilation. (3) A double-deck top covered body, also to the registered design of the British Electrical Federation, Ltd. This vehicle will have seating accommodation for 52 passengers. It will be mounted on a four wheel Daimler CF.6 forward control type chassis.

John Buckingham, Ltd., 332 and 333 Bradford Street, Birmingham. Stand No. 115. This well-known firm of body builders will show (1) a Pullman De Luxe coach body for long distance touring to seat 26 passengers, driver and courier. It will be mounted on a Daimler C.F.6. overtype six cylinder chassis. The price of the complete outfit is £1,925. (2) A Sun-saloon coach to seat 26 passengers, driver and courier, mounted on a Guy six cylinder forward drive drop frame four wheeled chassis, 45/85 h.p. engine and four wheel brakes. The wheels are shod with Dunlop pneumatic tyres. Price as shown £1,825.

Carrimore Six Wheelers, Ltd., Carrimore Works, High Road, Great North Road, North Finchley, London, N.12. Stand No. 111. This well-known firm of trailer manufacturers will be exhibiting a new range of trailers constructed on the lines of lorry design. The exclusive features claimed are:—(1) A pressed steel frame so designed that it obviates what is described as the present built-up rear carriage utilised in trailer construction. (2) Timken roller bearings to road wheels. (3) Silentbloc spring bushes. (4) Latest type spring anchorage. (5) 16 in. diameter fabric lined brakes. (6) Interposed flat tapered roller thrust race in the centre of the turntable to facilitate handling the fore-carriage. There is also to be exhibited a 20-ton Carrimore-Lynx eight-wheeler which will be the subject of a special description in a future issue.



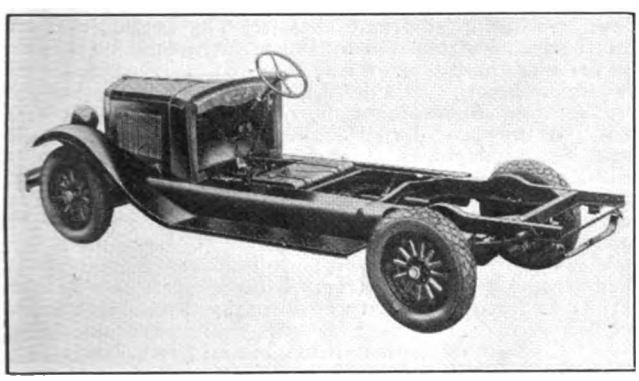
A 5/6-TON CARRIMORE TRAILER, BEING ONE OF TWELVE SUPPLIED TO THE G.W.RLY.

Digitized by Google

Carter, Paterson & Co., Ltd. (Motor Dept.), 8 Macclesfield Street, City Road, E.C.1. Stand No. 87. (1) A box van body, frame and hoops constructed in oak, and the hoops covered with tongued and grooved boarding. The sides covered with large aluminium panels, top also covered with aluminium. The back of the body is fitted with strongly hinged tailboard and a pair of tail sheets. A comfortable driver's cab with full width windscreen, the section in front of the driver being made to open. The offside of the cab is fitted with fixed door and the near side is left open for easy loading through an opening in the front of the body. The body is so mounted that no wheel arch appears on the inside, thus giving the best possible conditions for loading. Internal dimensions of the body—11 ft. long, 6 ft. wide and 6 ft. high; mounted complete with wings, steps, registration plates and lamp brackets, painted, written and varnished similar to exhibit. Mounted on Garner 2/2½ ton chassis. Price complete, £715. Body only, £115. (2) A driver's cab is fitted, constructed of oak framework and aluminium panels, the top and back being boarded with tongued and grooved boarding. The boarding over the top is covered over with prepared canvas. The cab has a V shaped front to suit radiator, a full width windscreen and high side doors. The whole is easily detachable to allow access to the engine. A steel framed tray is fitted to the chassis behind the cab to take detachable containers. The complete vehicle, painted, written and varnished, and fitted with steps, wings, registration plates, etc., as exhibited, mounted on Albion chassis, price £1,003 10s. Price of cab and tray, £85.

Challands, Ross & Co., Ltd., Canal Street, Nottingham. Stand No. 20. On their stand there will be three freight vehicles, all on Thornycroft chassis. They will consist of a 2-ton box van with enclosed cab, a 5-ton hinged sided lorry and a 10/12-ton three-way tipper on the latest "JC Forward" six cylinder, rigid six wheel chassis. The vehicle with the tipping body is similar to one supplied to the L.M.S. Railway.

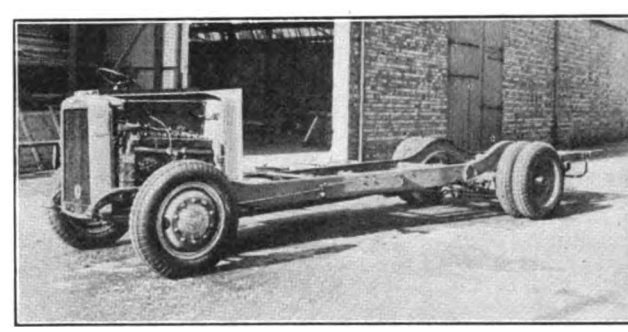
Chrysler Motors, Ltd., Mortlake Road, Kew Gardens, Surrey. Stand No. 83. On this stand there will be Fargo trucks which make their first appearance in this country. They are built in the truck section of Chrysler Motors, U.S.A. The models to be sold in this country are a 15 cwt. and a 30 cwt. chassis. A 30 cwt. chassis will be on view also a van. The engine is a Fargo six cylinder, bore 3 in., stroke 4⅛ in. developing 55 b.h.p. at 3,400 revs. Four bearing crank and cam shafts, alloy pistons, pressure lubrication, pump cooling, Stromberg carburetter, coil ignition. Clutch and gear box unit with engine. Dry plate clutch, four-speed gear box, two-piece tubular propeller shaft with three ball and trunnion type universal joints. Semi-floating rear axle with spiral bevel drive. Fargo hydraulic braking on all four wheels. Worm and nut steering, wood artillery wheels with demountable rims with 31 in. by 5¼ in. tyres front and 32 in. by 6 in. rear.



THE FARGO 30-CWT. TRUCK CHASSIS.

Citroen Cars, Ltd., Citroen Building, Brook Green, Hammersmith, London, W.6. Stand No. 78. The most interesting exhibit on this stand will be a new six cylinder 35 cwt. chassis. The engine is substantially the same as that of the well-known six cylinder Citroen car, also the chassis with the necessary strengthening modifications of back axle and frame. A four speed gear box is incorporated and Bendix Duo-Servo brakes are standard. There will also be a 13/30 h.p. four cylinder convertible tourer which can be converted from a four seater pleasure car to a useful covered wagon. A taxi-cab will be shown and the Citroen Kegresse in three types.

Commer Cars, Ltd., Luton. Stand No. 67. Of the six exhibits, three are on the new "Invader" chassis, type 6 TK, a high-efficiency six cylinder of 24 nominal h.p. developing 68 b.h.p. These are a polished chassis, a coach and a bus. The coach is an extremely interesting body turned out in the Commer Company's own shops. The objective has been to carry out the idea embodied in the design of the chassis itself, which closely approximates both in appearance and performance that of a large car. The coach, therefore, has been made to look like a limousine. Though the chassis will carry twenty passengers, seats for only sixteen have been provided, so that there is ample room and to spare for each passenger. The body lines have been kept as low as possible and the height from the ground to the top of the roof is but 7 ft. 8 ins. loaded, so that the coach is extremely safe and easy to handle on the worst of road surfaces. In conjunction with the "Invader" chassis which is fast and silent, this vehicle should provide the maximum comfort and safety for long journeys by road. The interior lighting is very specially thought out. The roof is panelled in the centre and covered with cloth at the sides. The lights are arranged over the passengers' heads, and there are none over the gangway that would take away the headroom. The contour of wings, like those of a motor car, complete the effect of a fast luxurious limousine. On the third "Invader" chassis is a single-decker 20-seater bus by Messrs. Willowbrook. The new Commer "Avenger" model is shown as a polished chassis and with a De Luxe coach body built by John Beadle, Ltd., Dartford. Though capable of carrying 32 passengers, this is a 26-seater, so that again there is ample room for luxury accommodation. The backs of the chairs are fitted with a rug rail which on being pulled, draws out a small table for refreshments, or reading. Inside the roof, running from end to end of the vehicle, is a special luggage trough of a new design which will hold the largest suitcases, but being out of the way, does not interfere with the headroom. The sixth exhibit is a G6, the new Commer 6/7 ton chassis which is of most interesting design. The simple expedient of moving the front axle to a position aft of the engine overcomes all the objections to the forward driver position, so that the new Commer complies with the regulations as to back axle loading, and sustains pay loads of up to 7 tons.



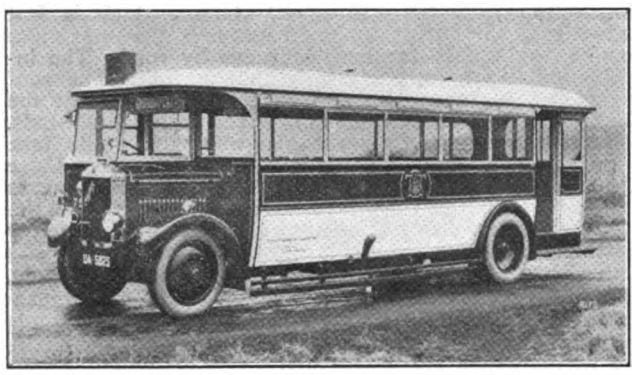
THE COMMER N.F.6 32-SEATER CHASSIS.

W. & G. du Cros, Ltd., Acton, London, W.3. Stand No. 135. The exhibits will consist of (1) a 40 h.p. six cylinder all-weather coach with dome back and fitted with "Walman" patent hood fitting. Price complete, £1,565. (2) A 27 h.p. six cylinder ambulance built to the order of the Harrogate Infirmary. (3) A similar chassis shown as chassis only. Price £680. (4) A 23 h.p. four cylinder low loading municipal vehicle. (5) A smaller vehicle but of similar horse power and lighter build and (6) a 23 h.p. laundry van.

Crossley Motors, Ltd., Gorton, Manchester. Stand No. 131. An interesting exhibit on the Crossley stand is a body designed and built throughout in the Crossley works. It is a two-decker with the staircase enclosed. Unloaded, the height of the vehicle is about 13 feet only. The upholstery is of moquette. The seating gives ample leg room. The arrangement of the top deck provides for three passengers to sit on each seat, and there is a gangway down each side of the seats. This body is mounted on the Crossley 38/110 h.p. six cylinder chassis, specially designed for double-deck work. A single-deck service vehicle is also exhibited. This is a 32-seater front en-

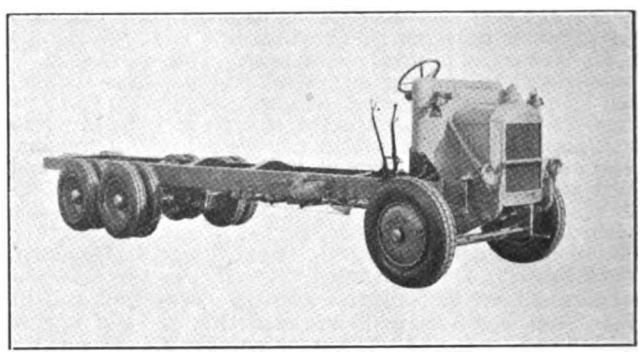
Digitized by Google

trance omnibus on the Crossley "Eagle" four cylinder chassis. The body is the product of Messrs. C. H. Roe (1923), Ltd., of Leeds, and follows the lines of the bodies this firm have supplied on Crossley chassis to the Leeds and other Corporations. Another interesting exhibit is a long distance luxury all weather coach designed for Wood Bros., of Blackpool. It has a lavatory and cloak room incorporated. The chassis is the Crossley 38/110 h.p. six cylinder model, similar to numbers in service for the Manchester Corporation and other large users. Another exhibit is a 28-seater de luxe "Pullman" saloon, with a body by Duple. The chassis is the 30/70 h.p. Crossley "Eagle" with forward steering. A 38/110 h.p. chassis is exhibited—a six cylinder model, treasury rating 38.4 h.p.; pump lubrication (dry sump principle); magneto ignition; Autovac petrol feed; four speed gear box; single plate clutch; full floating type rear axle with underdriven worm gear and bevel type differential; front wheel brakes



A 30/70 H.P. CROSSLEY "EAGLE" CHASSIS FITTED WITH 30-SEATER BUS BODY BY CHAS. H. ROE (1923), LTD., LEEDS.

100 by 130 m.m. bore and stroke, developing 100 b.h.p.; offset overhead valves operated by rocker arms and overhead camshaft; cylinder head and valve gear may be removed without touching the timing chain; crankshaft carried on 7 bearings; renewable cylinder liners; force-feed lubrication from submerged pump; ignition by high tension magneto; carburetter fed from 40-gallon tank by autovac; water circulated by pump driven in tandem with dynamo and magneto; single dry plate clutch; four forward speeds with central control; single shaft from change speed gate to gear box; whole unit is rubber mounted; propeller shaft in two sections with enclosed all-metal universal joints; centre bearing is rubber mounted; inverted worm-driven rear axle, the pot being on the nearside of the chassis, ratio 5.75 to 1. Steering by cam and roller; detachable steel disc wheels carrying 38 in. by 8¼ in. balloons, single front, twin rear; four-wheel vacuum-servo foot brake; hand brake operates on



THE DENNIS 12-TON RIGID SIX WHEEL CHASSIS.

operated by foot pedal and Dewandre servo attachment; hand brake operates separate set of shoes on rear axle; detachable disc wheels with 38 in. by 7 in. tyres (pneumatic); wheelbase 16 ft. 7½ in.; track 5 ft. 11¼ in.; electric lighting with provision for starter.

Daimler Co., Ltd., Daimler Works, Coventry. Stand No. 73. The exhibit will consist of a new C.F.6. double-deck model chassis. Its outstanding features, as compared with the Daimler C.F.6. chassis is described in our July number, page 536, includes a revised brake layout whereby the emergency brake shoes are housed within the rear hubs in order to comply with Scotland Yard Regulations. The petrol tank is outside the frame and a large Autovac supply tank mounted on the dash. The frame is, of course, of the double-deck pattern.

Davidson (Trafford Park), Ltd., Trafford Park, Manchester. Stand No. 134. Upon a Leyland "Lion" 4-ton chassis will be mounted a 30-seater general service bus in which the firm proposes fixing their patent reversible tilting tramcar seat. Attention is also drawn to the firm's patent sliding roof consisting of five hatches which can be opened independently. There will also be a 28-seater sun saloon coach mounted on a Tilling-Stevens chassis and a 20-seater one-man bus on a Morris commercial "Y" type chassis.

Dennis Bros., Ltd., Guildford. Stand No. 76. This famous firm will, in addition to already well-known models, stage four entirely new ones of which the following are brief particulars:—(1) A six cylinder 20-seater to be known as the "Dart." The engine cast en bloc, 85 by 120 m.m. bore and stroke, developing 30 b.h.p. at 1,000 and up to 60 b.h.p.; overhead valves placed on one side and operated by enclosed push rods; ignition by high tension magneto with variable timing; carburetter fed by mechanical pump from 15 gallon tank; water circulated by pump driven in tandem with dynamo and magneto; four forward speeds with right-hand control; tubular propeller shaft enclosed in torque tube supported by central roller bearing; inverted worm-driven rear axle, ratio 5.6 to 1; front axle designed to take front wheel braking stresses; detachable steel disc wheels, 33 in. by 5 in. straight-sided pneumatic tyres, single front and twin rear; 4-wheel vacuum-Servo foot brake; hand brake on rear wheels only; wheelbase 13 ft. 2¾ in.; wheel track, front 5 ft. 2 in., rear 5 ft. 0⅜ in.; frame height 21½ in. Equipment includes 12-volt dynamo lighting set with battery, head, side and tail lamps, illuminated panel with clock, speedometer, oil gauge, ammeter and switch box; self-starter, electric horn, lifting jack, tool kit. Chassis price, £625. (2) A six cylinder 32-seater to be known as the "Arrow." The engine cast en bloc, rear wheels only; wheelbase 16 ft. 6 in., wheel track, front 6 ft. 3⅜ in.; wheel track, rear 5 ft. 10½ in., frame height 24 in. Chassis price, £1,100. (3) A six cylinder 45/100 h.p. 12-ton, 6-wheel rigid frame chassis. The engine, cast en bloc; bore and stroke 110 by 140 m.m.; detachable heads, one per pair; high tension magneto driven in tandem with the water pump; variable ignition; carburetter fed by autovac; four forward speeds, operated by a single rod from gate to box; large diameter propeller shaft with metal universal joints at each end; twin pot-type rear axles connected by differential in front of the forward axle, each fitted with oil filler and dip-stick; all wheels run on taper roller bearings; cam and lever steering; forward control; foot brake to all 6 wheels assisted by dual vacuum-servos; hand brake to four rear wheels; wheel track (front) 6 ft. 5⅜ in. (rear) 5 ft. 8¾ in.; frame height 3 ft. 2 in.; straight sided tyres 40 in. by 8 in. single front and twin rear. Equipment includes spare wheel and tyre, 12-volt lighting set with dynamo battery, tail, 2 side and 2 head lamps, self-starter, horn, driver's mirror, jack and tool kit. Price £1,425. (4) A 2-ton chassis with a four cylinder 42 b.h.p. monobloc engine with overhead valves, 85 by 120 m.m. bore and stroke. All valves are placed on one side and operated by enclosed push rods. Simms S.F.4. magneto. External cone-type clutch faced with fabric and adjustable; four forward speeds; dip-stick in gear box; spherically headed torque tube of large diameter transmitting the driving thrust and brake re-action and supporting propeller shaft in a roller bearing; Dennis worm-driven rear axle; detachable steel disc wheels with straight-sided pneumatic tyres 32 in. by 6 in. single front, twin rear (7 tyres); servo-assisted foot brakes; wheelbase 12 ft., track 5 ft. 1⅜ in., frame height 2 ft. 3⅜ in. Equipment includes speedometer and mileage indicator, Lucas dynamo lighting set with 2 head, 2 side and tail lamps, electric horn, driver's mirror, lifting jack, tool kit. Price £420. The other Dennis exhibits will be (a) 30 cwt. chassis. (b) A new GL-type low-load-line bus with vacuum-servo four-wheel brakes. (c) An "EV" type 32-seater bus and (d) a 350/450 gallon low-load-line fire engine.

Dodge Bros. (Britain), Ltd., Park Royal Road, North Acton, London, N.W.10. Stand No. 68. The Dodge range of vehicles exhibited will include 15 and 25 cwt. express vans; a 30 cwt. chassis; a 2-ton, 150 in. wheelbase, lorry; 20 and 26-seater de luxe Parlour coaches on the L.E.R. and H.E.X type chassis and a 3-ton R.E.X. type chassis. The 15 cwt. chassis is fitted with a 21.03 h.p.

Digitized by Google

four cylinder engine, 3⅛ in. bore and 4½ in. stroke. The rear axle is semi-floating with spiral bevel drive. There are a single plate clutch and three-speed gear box, four wheel foot brakes and propeller shaft hand brake. The chassis details of the 25 and 30 cwt. 2-ton and 3-ton models are very similar to those of the 15 cwt. except that the 25 cwt., 2-ton and 3-ton models each has a 27.34 six cylinder engine, whilst the 30 cwt. model has a four cylinder engine of 21.03 h.p. or, alternatively a six cylinder engine of 27.34 h.p. The 30 cwt., 2-ton and 3-ton models also have four-speed gear boxes. The 15 cwt. model has Wood artillery wheels, the 25 cwt. model metal spoke wheels, the 30 cwt. model and the 2-ton model steel spoke wheels and the 3-ton model metal disc wheels. With regard to the six cylinder engine it has a seven bearing crankshaft, pressure lubrication, aluminium alloy pistons with steel struts, pump water circulation, radiator shutters, and all parts are easily accessible.

Christopher Dodson, Ltd., Cobbold Road, Willesden, London, N.W.10. Stand No. 33. This firm's products will be represented by (1) a double-deck covered top bus body to seat 52 passengers, mounted on a Leyland "Titan" chassis. It has 9 drop windows in the upper deck and 6 in the lower compartment and plate glass louvres fitted above the main side glasses in the lower compartment. Semi-bucket seats with flexible spring backs trimmed in leather. (2) A single-deck 32-seater bus body mounted on a Tilling-Stevens "Express" chassis. It has two entrances on the near side and 8 drop windows. The seats are similar to those on the double-deck model. (3) A parlour coach body for 20 passengers mounted on a Dennis "F" type chassis, this also has two entrances and arm-chair seats are provided. Luggage is carried at the forward end of the roof. Luggage lockers are also provided along the seats below the floor line. The interior decorations and fittings are handsome and comfortable and ventilation is well carried out. In addition to the above three chassis, on the Sunbeam stand are exhibited with Christopher Dodson bodies, one bus being a 67-passenger double-decker with totally enclosed staircase.

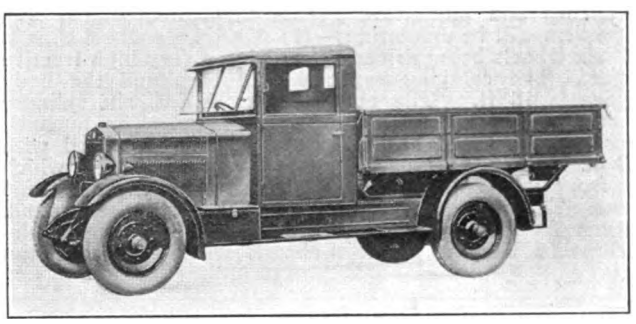
Duple Bodies & Motors, Ltd., Edgware Road, The Hyde, Hendon, London, N.W.9. Stand No. 102. A 28-seater parlour coach with buttress patented type body mounted on an A.E.C. Regal forward steering W.B. chassis. The body is specially designed to minimise dents and scratches to rear wings and rear and side panels. There are two doors on the near side and a driver's door on the off side. All windows are of the drop type. There are luggage lockers in the sides of the body and the roof is the Cleristory type incorporating the Barwatt patent mechanical one-man operated head. The seats are the firm's patent lateral sliding type, designed that when occupied they slide towards the gangways, thus giving more seating room, automatically returning to the original position when vacated. All seats are fitted with arm and foot rests and have glass topped walnut tables on the back. The interior furnishing is very complete, including flush electric lamps, clock, mirrors, etc. (2) A 28-seater parlour coach of the buttress type, mounted on a Maudslay M.L.6. forward drive six cylinder chassis. The body is built up on a false floor, giving deep and wide luggage compartments in the sides of the body and under the floor. The seats are as above described. (3) A 26-seater pullman saloon body mounted on a Gilford normal steering chassis. The seats are special De Luxe with arm rests. There are luggage lockers on each side of the body and a luggage rail is fitted to the roof. All windows are of the drop type. (4) A 17-seater De Luxe pullman body with Cleristory roof mounted on a Star V.B.4. normal drive chassis, The seats are of the De Luxe armchair type.

R. A. Dyson & Co., Ltd., 76-80 Grafton Street, Liverpool, S. Stand No. 113. The following represent brief details of the exhibits. (1) One special heavy-duty trailer capable of transporting 110 ton loads. This trailer will be a feature of the show, it is fitted with 32 wheels and solid rubber tyres. (2) One 4-ton four wheel pneumatic tyred trailer being one of the most popular models It is fitted with a flat platform body, the axles are mounted on Timken roller bearings and eight-stud fitting hubs with detachable disc wheels on 32 in. by 6 in. pneumatic tyres, fitted up with spare wheel carrier, and spare wheel complete with cover and tube. Domed mudguards are also fitted. (3) One trailer horse box, designed to carry two horses. It is fitted with ball bearing axle and detachable disc wheels with pneumatic tyres.

Eccles Motor Caravans, Ltd., Hazelwell Lane, Pershore Road, Stirchley, Birmingham. Stand No. 133. This year the feature of the exhibit will be horse boxes both as complete motor units and as trailers. The exhibits will be as follows:—(1) A trailer designed to carry one horse and easily hauled by an 18-20 h.p. car. This box is designed mainly for hunting people. (2) A semi-trailer articulated six-wheeler horse-box which by a turn-table arrangement can be super-imposed on any 25-30 cwt. chassis, such as the Bean. (3) A horse-box mounted on a Reo speed chassis built to the order of Mr. A. P. Hammond, Rutland Garage & Stables, Newmarket. This vehicle is to carry two horses. There will also be a trailer box body for carrying hounds and a light goods carrying trailer.

English Electric Co., Ltd., Queen's House, Kingsway, London, W.C.2. Stand No. 60. This firm will exhibit a three axle double-deck trolley bus to seat 56 passengers.

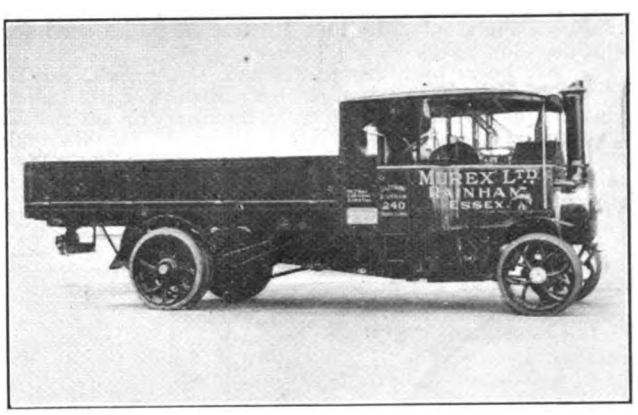
Fiat (England), Ltd., 43-44 Albemarle Street, London, W.1. Stand No. 48. Two new commercial chassis pro-



A FIAT 35-CWT. TRUCK.

duced by this firm are to be exhibited for the first time. Both these chassis are fitted with an 18/55 h.p. six cylinder engine, four speed gear box, front wheel brakes and worm axle. The one chassis is a 35 cwt. goods model costing £325, and the other is a 14/17-seater bus chassis costing £360. The engine has a seven bearing crankshaft with vibration damper at front end. The radiator is the demountable sectional type. The clutch is a multiple disc type with asbestos linings. The gear box is en bloc with the engine. The rear axle is worm driven with torque and thrust taken up by springs. Coil and battery ignition is provided and there is a large capacity heavy duty battery, starter, head and side lamps.

Fodens, Ltd., Sandbach, Cheshire. Stand No. 79. This famous firm of steam wagon manufacturers will exhibit (1) A "Speed-Six" model fitted with a standard plat-



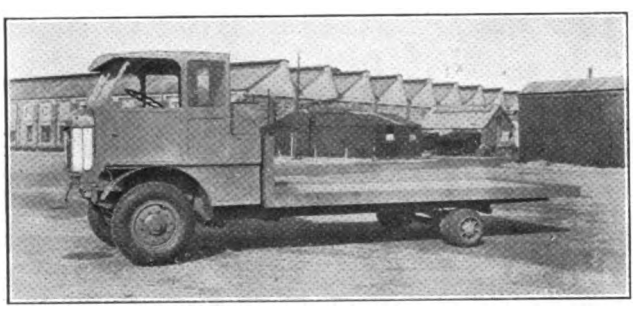
THE FODEN 6-TON UNDERTYPE STANDARD WAGON.

form lorry. This wagon will have a patent two-cylinder engine developing 90 b.h.p. and a patent horizontal water tube boiler and pneumatic tyres. The wheelbase is 13 ft. and the load capacity is 6 tons. Further particulars are not yet to hand but it will undoubtedly be a most interesting exhibit. (2) A Foden 6-ton standard platform lorry with a 45 b.h.p. engine 4¼ in. and 7 in. bore and 7 in. stroke. It is built to haul a trailer carrying an additional 4 tons. It is fitted with solid tyres 180 m.m. by 771 m.m. front and 180 m.m. by 850 m.m. twin rear. It is provided with a three-speed gear giving 4, 8 and 12 miles per hour. The gear control mechanism consists of two levers on the foot plate. The drive is

Digitized by Google

transmitted from the crankshaft to a fixed stud shaft and thence by a strong roller chain to the compensating gear on the main axle. Steering is of the Ackermann type. (3) A similar chassis fitted with a three-way tipping body which is hydraulically operated. (4) A rigid frame six-wheel platform lorry with engine the same as exhibit 2, load capacity 10/12 tons, platform 16 ft. 6 in. long, wheelbase 14 ft. 9 in. The bogie axles are chain driven. Two independent brakes are provided hydraulically operated on all four rear wheels, and a power band brake operates on the forward bogie axle.

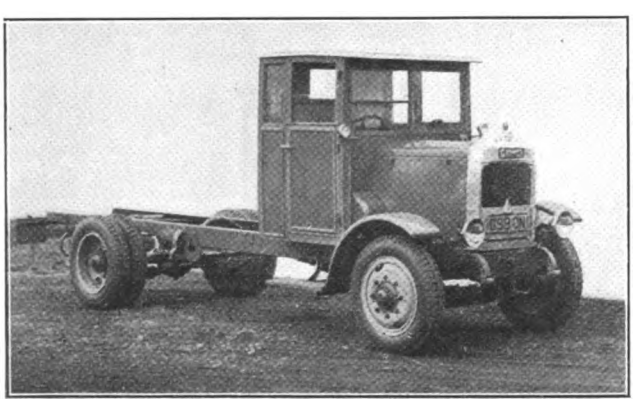
Four Wheel Drive Motors, Ltd., 46 Charing Cross, London, S.W.1. Stand No. 27. Following upon a working arrangement concluded between the Associated Equipment Co., Ltd., and the Four Wheel Drive Lorry Co., the latter has been re-organised and the company will be known as Four Wheel Drive Motors, Ltd. Many standard components and parts of A.E.C. manufacture will be utilised in the construction of four and six wheel drive F.W.D. chassis, and these vehicles and many types of special equipment will be marketed through the A.E.C. branches and authorised agents throughout the world. The firm will be exhibiting:—(1) A rigid six wheel chassis all six wheels being driven thus giving a very high tractive effort. The carrying capacity is 8 tons and the body space is 18 ft. The engine is an A.E.C. six cylinder model developing 92 h.p. at 2,400 r.p.m. The machine has eight forward speeds. Road wheels are fitted with 38 in. by 9 in. pneumatic tyres. (2) A low loader which is front wheel driven and has a carrying capacity of 6 tons. The frame height is only 2 ft. from the ground. Seven forward speeds are provided. The engine develops 56 b.h.p. On this chassis will be mounted an



THE F.W.D. LOW LOADER.

"Eagle" rotary refuse collecting body. (3) A four wheel driven tractor which also steers on all four wheels. It has a tractive effort of 9,060 lb. and an engine developing 70 b.h.p. (4) A 6-ton three-way hydraulic tipper and (5) a half-track special tractor being one of three built for the Royal National Life-Boat Institution to be used for launching life-boats.

Fry Brothers, Ltd., Norman Road, Greenwich, S.E.10. Stand No. 57. There will be exhibited a 1,500 gallon elliptical road vehicle spirit tank, mounted on an A.E.C. "Regent" chassis. The principal features of this tank are as follows:—The centre of gravity is exceedingly low; the wheel arches are embodied in the tank itself; special form of mounting on rubber blocks; all cocks and foot valves are operated at the rear of the tank.



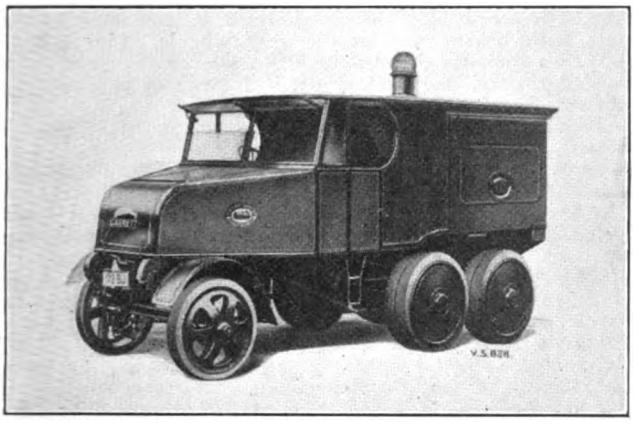
THE NEW GARNER A.J. 50/60-CWT. CHASSIS.

Garner Motors, Ltd., Tyseley, Birmingham. Stand No. 127. The exhibits will consist of the following:—(1) A "Model JO" 60/65 cwt. overtype van with a four cylinder 100 m.m. bore by 140 m.m. stroke engine developing 50 b.h.p. at 1,800 r.p.m., single plate clutch, four-speed gear box, two-piece propeller shaft, overhead worm driven axle, underslung rear springs, full forward driving position with Garner patented accessibility, 34 in. by 7 in. Dunlop Fort reinforced pneumatic tyres, twin rear, spare wheel and tyre, valanced front wings and steps, tyre carrier, speedometer, mechanical tyre pump, 12-volt five lamp lighting set, 25-gallon tank with Autovac feed, 14 ft. 3 in. wheelbase, frame line 2 ft. 3 in. laden, track 5 ft. Fitted with tilt van body, measurements 17 ft. by 7 ft. by 8 ft. high, with additional loading space over the driver's cab. Total capacity 1,006 cubic feet. Price complete, £807. Chassis of 10 ft. 6 in., 11 ft. 3 in. and 12 ft. 5 in. wheelbase, with complete equipment of tools, lighting set, valanced front wings and steps, speedometer, mechanical tyre pump, spare wheel tyre and carrier, £615. Chassis of 14 ft. 3 in. wheelbase with similar equipment, £630. (2) A "Model AJ" 50/60 cwt. chassis with cab and insulated van body, with engine and chassis similar to above but with semi-forward control, 32 in. by 6 in. Dunlop Fort tyres. Fitted with hygienic insulated van body with pay load measurements of 12 ft. by 6 ft. 6 in. by 5 ft. 6 in. high. The body is strongly constructed of sheet steel with a thick layer of insulating material between an inner shell of galvanised steel. Price complete, £695. Chassis of 10 ft. 6 in., 11 ft. 3 in. and 12 ft. 5 in. wheelbase with complete equipment £560. Chassis of 14 ft. 3 in. wheelbase with similar equipment, £575. (3) A "Model AE" 50 cwt. general purpose lorry with a four cylinder 100 m.m. bore by 140 m.m. stroke, developing 48 b.h.p. at 1,800 r.p.m., four-speed gear box, full floating rear axle, worm driven, internal expanding rear wheel brakes, semi-forward driving position, 12 ft. wheelbase, Avon 32 in. by 6 in. giant pneumatic front tyres, 34 in. by 7 in. rear, with spare wheel and tyre. 12-volt three lamp lighting set. Fitted with driver's cab and hinged sided lorry body. Price complete, £676. Chassis only, £565. (4) A "Model RO" 40/45 cwt. overtype box van with a four cylinder 85 m.m. bore by 130 m.m. stroke, engine developing 45 b.h.p. at 2,200 r.p.m. with Ricardo head, full forced feed lubrication, pump cooling, single plate clutch, overhead worm driven axle, underslung rear springs, side by side brakes, full forward driving position with patented accessibility, 33 in. by 5 in. Dunlop Fort tyres, twin rear. Fitted with panelled van body measurements of 14 ft. 4 in. by 6 ft. by 6 ft. 8 in. high, with additional loading space over the driver's cab. Price complete, £595. Chassis of 10 ft., 11 ft. and 12 ft. wheelbase, £475. Chassis of 13 ft. 8 in. wheelbase, £487. (5) A "Model AB" 35/40 cwt. lorry with side trays with a 4 cylinder 80 m.m. by 130 m.m., developing 35 b.h.p. at 2,000 r.p.m., four-speed gear box, two-piece propeller shaft, overhead worm driven axle, internal expanding side by side brakes, underslung rear springs, Avon 32 in. by 6 in. giant pneumatic tyres, with spare wheel, tyre and tyre carrier, 12 ft. wheelbase, three lamp 6-volt lighting set, speedometer, valanced front wings and steps. Price, £468. Standard chassis price, with 10 ft., 11 ft. and 12 ft. wheelbase, £385. With 13 ft. 8 in. wheelbase, £395. (6) A "Model AB" 35/40 cwt. lorry body and oil discharge pump with demountable tank of 250 gallons with 2 compartments. Chassis as above, but with 11 ft. wheelbase, and fitted with 32 in. by 6 in. Avon single pneumatic tyre equipment. Gear box driven power take-off for oil discharge pump. Price complete £529. (7) A "Model WDL6" rigid six wheeled chassis. Engine: as for 4 and 5. Colonial type radiator, single plate clutch, four-speed main gear box, two-speed auxiliary, giving eight forward speeds and two reverse, War Office type bogie, patented articulated front suspension, full forward control engine accessibility air cleaner, oil filter, mechanical tyre pump, front wings, running boards, speedometer, five lamp lighting set, self-starter, bumper bar, 34 in. by 7 in. by 7 ft. 5 in. Dunlop Bus Balloon tyres with spare wheel and tyre, 9 ft. 7½ in. mean wheelbase, 40 in. bogie centres, 11 ft. loading space behind driver. Price of chassis, as shown, £850. Price of commercial chassis, £775.

Richard Garrett & Sons, Ltd., Aldwych House, Aldwych, London, W.C.2. Stand No. 125. The exhibits will consist chiefly of the firm's well-known rigid six wheel undertype steam wagons introduced upwards of three years ago. The exhibits will be as follows:—(1) A six wheel undertype steam wagon fitted with water tube boiler, poppet valve engine, forward steering, two-speed gear, accelerator control and patent pivoted rear axle with double chain drive. There are three sets of independent brakes, namely, the hand brake on the forward driving wheels, the foot brake on the rear driving wheels and an additional steam brake to all four driving wheels.

Digitized by Google

This wagon has been sold to the Marley Tile Co., Ltd., Harrietsham, Kent, being the seventh supplied to this firm. (2) A similar chassis fitted with a flat platform body 19 ft. 1 in. long by 6 ft. 10 in. wide, built to the order of Emanuel Smith & Sons, Ham Wharf, Brentford. (3) A similar but shortened chassis fitted with a three-way tipping body built to the order of Messrs. L. Terry & Co., Offham, West Malling, Kent. (4) A four wheel undertype steam wagon fitted with forward



THE NEW GARRETT "SUFFOLK PUNCH" RIGID SIX WHEEL STEAM TRACTOR.

driving position for the driver, similar to the six wheel models. Double chain drive to rear wheels, built for Messrs. H. E. Blunt & Sons, Sholden, Deal. (5) A "Suffolk Punch" rigid six wheel steam tractor, as illustrated, capable of hauling a load of 40 tons.

General Motors, Ltd., (Chevrolet Motors), Edgware Road, The Hyde, London, N.W.9. Stand No. 119. On this stand there will be exhibited the following Chevrolet models:—(1) A 12 cwt. light delivery van, £183. (2) A 30 cwt. end-tipping lorry, £244. (3) A 30 cwt. box van, £250. (4) A 14-seater omnibus, £405. (5) 2-stretcher ambulance, £350. (6) A special "Expando" van on the 30 cwt. chassis, price £875 and (7) a 30 cwt. "Cut" chassis. With regard to the Chevrolet "Expando" van: It is a special van designed for the use of travelling salesmen and has had enthusiastic reception in America. This is the first model to be exhibited in this country. For travelling on the road the body is no wider than the ordinary box van; when parked the two sides are expandable to allow approximately double the space inside for the display of goods and samples. Briefly the "Expando" body consists of four units: the main body, two half bodies and the top assembly. The two half bodies are expanded by means of an electric motor run from the batteries. As they expand so the roof rises to allow extra headroom inside the vehicle. The roof is fitted with frosted glass windows and an electric light. The half bodies are virtually show cases, built ready for the installation of standard fixture interior equipment. They are shoulder high and fitted with display lights. Entrance to the body is by a door at the rear fitted with frosted glass window. A special combined rear step and bumper bar is fitted. The whole installation is practically foolproof; the "Expando" mechanism is controlled by a switch in the driving compartment and an automatic stop trigger stops the motor when the fully-expanded or contracted positions are reached.

General Motors, Ltd. (G.M.C.). Stand No. 126. The following models will be on view:—(1) A G.M.C. type T19B "Pioneer" 35 cwt. chassis with boarded tilt van body, price £420. The capacity of this van is 360 cubic feet. It has Primax panels either side 43½ in. deep and the upper structure is built on ash hoop sticks, covered by tongued and grooved boards in a weather resisting canvas. With regard to the chassis: The engine is an L head six cylinder model developing a maximum of 58 b.h.p. at 3,000 r.p.m. Lubrication is forced feed to main and connecting rod bearings. Ignition is the Delco-Remy six-volt battery type. The starting motor is also a six-volt Delco-Remy. There is a four-speed gear mounted as unit with engine; transmission by two tubular shafts with three universal joints to the spiral bevel rear axle. Four wheel brakes. New chassis, price £325, reduced from £375. On a similar chassis there will be mounted a patent float for carrying three beasts or, as a double-deck body, for sheep, pigs and calves. Another exhibit will be the "Explorer" 20-seater all-weather coach, price £1,030; bodywork by London Lorries, Ltd. The engine is a Buick overhead valve type six cylinder developing 72 b.h.p. at 2,500 r.p.m. The specification for the chassis follows closely that of the "Pioneer"; the chassis price is £495, reduced from £545. A third exhibit will be the "Crusader" with a 24-seater saloon bus body by Duple Motors, price £1,075. This also has a 72 b.h.p. engine at 2,500 r.p.m. It has a 14 ft. 7 in. wheelbase, the chassis price is £575, reduced from £625. The fourth exhibit, the "Developer," is a 26-passenger saloon bus, bodywork by Duple Bodies. Price £1,265. This chassis has a 16 ft. 8 in. wheelbase. It has a Buick overhead valve type six cylinder engine developing 89 b.h.p. at 2,500 r.p.m., Bendix type brakes on all four wheels, a four-speed gear box and worm gear full-floating type rear axle. Chassis price £725, reduced from £825.

Gilford Motor Co., Ltd., 465 and 471a Holloway Road, London, N.7. Stand No. 128. The following vehicles will be staged:—(1) Chassis 168 S.D. low load line type with six cylinder engine, 3⅛ in. bore, 5 in. stroke developing 105 h.p. Forced feed lubrication, magneto ignition, multiple dry disc clutch, four-speed gear box, semi-elliptic spring suspension with "Silentbloc" bushes. Front supported by "Gruss" air springs. Rear fitted with Luvax rebound absorbers. Fully floating underslung worm rear axle. Four wheel brakes. Central lubricating system. Wheels, detachable ten-stud pressed steel, fitted with 36 in. by 7 in. tyres single front, twin rear. Wheelbase 16 ft. 8 in. Price, complete with detachable bumper, electric lighting and starting, tyre pumps, speedometer and clock, etc., £875. (2) A six cylinder G.P.6. low load line 20-seater chassis, engine developing 31.5 h.p. Treasury rating. Details similar to above but with 36 in. by 6 in. tyres, 13 ft. 3 in. wheelbase. Chassis price, £595. (3) A 168 O.T. type chassis with engine as in No. 1 exhibit. Central change speed control brought forward into driver's compartment completely insulated from frame. Accessibility to engine by removable pressed steel plates. This chassis will be fitted with a 33-seater Gilford "Northumbria" all-weather coach with "Plein Azur" flexible sliding roof. Chassis price, £895; body, £650. (4) A Beadle special double-deck service bus, on chassis similar to No. 3 exhibit, but with modifications to accommodate a double-deck bus body. Chassis price, £925; body, £795. (5) A Wycombe 26-seater de-luxe-pullman saloon coach on 168 O.T. type chassis. Chassis price, £895; body, £795. There will also be one six cylinder type 168 O.T. chassis engine and a 168 O.T. differential.

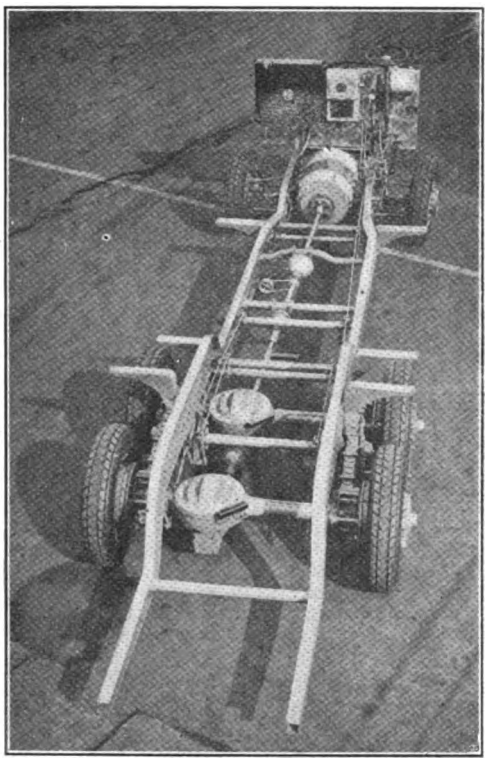
Glover, Webb & Liversidge, Ltd., 561 Old Kent Road, London, S.E.1. Stand No. 54. There will be three exhibits:—(1) A box van suitable for furniture carrying, the dimensions being 13 ft. long by 6 ft. 4 in. wide by 6 ft. 11 in. high inside dimensions. Mounted on a 2½-ton Gilford chassis with pneumatic tyres. (2) An open body mounted on a similar chassis. (3) A box van on a 30 cwt. Reo speed wagon.

Grose, Ltd., Marefair, Northampton. Stand No. 110. There will be exhibited:—(1) A "Grose" 54-seater double-deck covered type omnibus mounted on a six cylinder Guy F.C.X. six wheel chassis. (2) A 20-seater De Luxe type saloon bus with semi-bucket type seats mounted on a 26.3 h.p. six cylinder "G.M.C." T.30 chassis and (3) a 20-seater parlour coach with De Luxe type armchair seats mounted on a six cylinder Star "Flyer" chassis.

Guy Motors, Ltd., Fallings Park, Wolverhampton. Stand No. 49. The following will be the exhibits:—(1) A 48-seater four wheel double-deck bus on a forward control chassis, with six cylinder engine, 4¼ in. bore by 5½ in. stroke, 58/105 h.p. Chassis weight, 3 tons 15 cwt.; tyres 34 in. by 7 in.; four wheel brakes, heavy duty lighting set, self-starter, covered top body. (2) A 32-seater single-deck bus on forward control chassis, six cylinder engine, 4 in. bore by 5½ in. stroke, developing 50/85 h.p. (3) A 32-seater de luxe coach on a similar chassis to exhibit No. 2. (4) A 20-seater coach mounted on a long wheelbase chassis with four cylinder engine, 90 m.m. bore by 130 m.m. stroke. Four wheel brakes, servo assisted, 12-volt lighting and starting set, speedometer, etc. (5) A 30 cwt. chassis with engine similar to No. 4 exhibit. (6) A 2-ton flat platform lorry with engine similar to 4 and 5 exhibits. (7) A Six wheeled trackless trolley bus chassis and (8) a six cylinder engine and gear box unit. The following improvements are incorporated in the Guy chassis:—(a) An improved radiator to passenger models. (b) The steering box of all forward control models has been set back, to reduce excessive protrusion of the drop

Digitized by Google

arm when on full lock. (c) The dumb irons and steering box have been covered with aluminium sheeting. (d) There are petrol gauges to all petrol tanks on the passenger chassis. (e) On the drop frame passenger models, the sweep at the end of the frame has been lowered. (f) The six cylinder engine cylinder heads have been improved and greater power obtained. (g) Chassis lubrication has been improved. (h) On all chassis from 3 tons to 26 seating capacity, the engine, clutch and gear box, are mounted



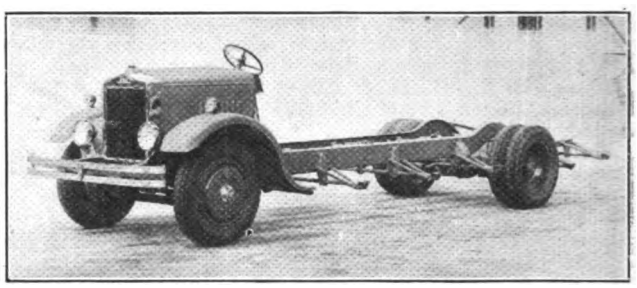
THE GUY SIX WHEEL PASSENGER CHASSIS.

on the Guy patented flexible platform. (i) On the six cylinder models additional central bearings are fitted to the gear box to carry the main shaft and lay shaft. There are three new models appearing at Olympia, namely:—A 6-ton four wheeler on the Bromilow and Edward's stand, the 2-ton model mentioned above and the "Invincible" chassis, a four wheel double-decker.

Halley Motors, Limited, Yoker, Glasgow. Stand No. 117. Five vehicles consisting of 2 passenger models and 3 goods models are exhibited as follows:—(1) A show finished "Conqueror" chassis incorporating the four cylinder Halley engine introduced a year ago at the last Scottish Motor Show. Rated at 30.6 R.A.C. rating, 85 b.h.p., is developed at 2,600 r.p.m. Ricardo combustion chambers, masked inlet valves, and dual inlet manifold are embodied, and all auxiliaries are mounted on the near side, the engine being entirely clear on the off side for forward control chassis. The crankcase sump is jointed in one plane only. An extension of the crankcase carries a four-speed gear box, and the change speed control is mounted on the off side. The cardan shaft is of Hardy Spicer type supported centrally by a ball bearing carried in a steel bracket attached to a tubular cross member of the frame. Four wheel brakes, operated by Dewandre Servo, are standard. The hand brake operates on shoes placed alongside the foot brake shoes in the rear axle which is of the inverted underslung worm type. Alternative tyre equipments are available, the actual tyres fitted in this instance being 36 in. by 7 in. Dunlop giant pneumatic single front, twin rear. Central chassis lubrication is fitted, the "ALCYL" system being adopted. (2) The other passenger model consists of a front entrance 30-seated double purpose bus or coach mounted on the "Conqueror" chassis. This vehicle is equipped with 38 in. by 8¼ in. Dunlop balloon tyres. The bodywork is by F. D. Cowieson & Coy., of Glasgow. (3) The heaviest goods model shown is the 5-ton forward control model "E.F.2" fitted with flat platform lorry body and cab. The wheelbase of this machine is 11 ft., giving a platform space of 14 ft. 6 in. with a turning circle of 40 ft. 3 in. The engine employed in this chassis is the 30/85 horse power four cylinder engine, similar to that in the "Conqueror" chassis. (4) A special municipal refuse collection vehicle, fitted with a Bromilow and Edwards hydraulic end tip dustless refuse collection body, having a load capacity of 2½ tons or 7 cubic yards, mounted on model "W.21" chassis, which is a semi-forward control type. The engine fitted is of 22.5 R.A.C. rating with four cylinders 3¾ in. bore by 5 in. stroke. A four-speed gear box, mounted in unit with the engine and clutch and worm driven back axle completes the transmission layout; both brakes are on the rear wheels. (5) A 26/40 h.p. four cylinder 3-ton vehicle on pneumatic tyres, fitted with a roomy, deep sided, tilt van body to the order of Messrs. Scott, Preserve Makers, Ltd.

Thos. Harrington, Ltd., 89 Church Street, Brighton. Stand No. 65. The following examples of coach and body work will be shown:—(1) A Southern Railway drop sided tailboard lorry mounted on a Karrier SK5 chassis. (2) A special Harrington 26-seater Pullman saloon coach, with seats of the pullman saloon type with arm rests, luggage accommodation, etc., the whole mounted on a Halley "Chieftain" chassis. (3) A Harrington 22-seater Pullman coach fitted with Walman sliding head, the whole mounted on an A.E.C. "Regal" chassis.

Harris and Hasell (1929), Ltd., St. George's Road, Bristol, and 79-89 Pentonville Road, London, N.1. Stand No. 120. The exhibit will consist of the firm's two newly produced chassis, namely, the B.A.T. "Cruiser" 20-seater or 2-ton chassis and the B.A.T. "Super Pullman" chassis. The B.A.T. "Cruiser" 20-seater or 2-ton chassis was fully

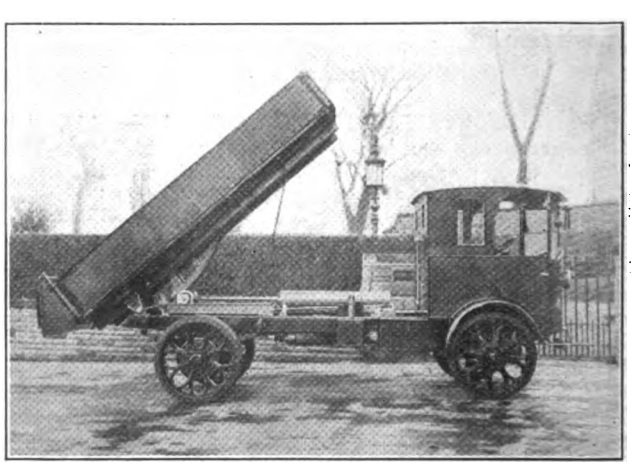


THE B.A.T. CRUISER CHASSIS.

described and illustrated in the WORLD'S CARRIERS October number, page 51. Both will be exhibited as bare chassis, and also complete vehicles as follows:—A 20-seater long distance luxury coach, a 20-seater De Luxe service bus and a solid top tilt van all mounted on the B.A.T. "Cruiser" chassis.

Hudson Essex Motors, Ltd., Great West Road, London, W.4. Stand No. 82. The exhibit will consist of the Dover Commercial Super-Six chassis at £185, mounted with a panel van, price complete £260, and on another chassis the screen side express at £250. The six cylinder engine of this chassis develops 55 b.h.p. Power is transmitted through a disc clutch to a three-speed gear box and from thence to the spiral bevel back axle through a tubular propeller shaft.

Hydraulic Hoist Co., Ltd., 182, Lord Street, South-

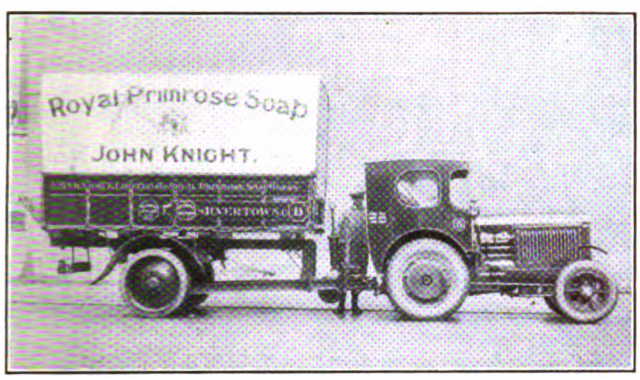


AN ALBION CHASSIS FITTED WITH THE "WOOD" HYDRAULIC HOIST TIPPING GEAR AND MILD STEEL BODY.

Digitized by Google

port. Stand No. 5. There are to be exhibited the F5A "Wood" hydraulic tipping gear and a mild steel body mounted on an Albion 35/55 h.p. 5-ton overtype chassis. The gear is on three vital moving parts all operating in oil. A steel cylinder containing the ram also acts as an oil reservoir. On the exterior end of the ram is a cross head and arm with two sets of rollers, two of which run on a rolled steel joist track frame, mounted on the chassis. The other pair of rollers bear up against wedge shaped arms or cams mounted on the underside of the body. The tipping action is obtained by the thrust of the ram on the crossarm and in turn on the roller, thus forming a rolling wedge between the cams and the tracks. Other exhibits will include gear parts dismantled and in section, also power take-offs for various chassis.

International Harvester Company of Great Britain, Limited, 259 City Road Road, London, E.C.1. Stand No. 112. (1) A 43.2 h.p. four cylinder model SL-34 low

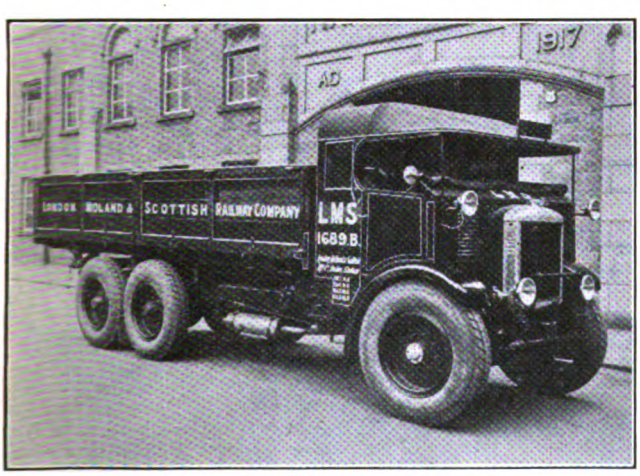


THE INTERNATIONAL HARVESTER 10-TON HAULAGE TRACTOR.

loading 20-seater all-weather saloon coach. (2) A 50 h.p. six cylinder model SF-46 chassis. (3) A 43.2 h.p. four cylinder model S-24, 2-ton tipper. (4) A 28.9 h.p. four cylinder model "20" industrial 10 ton tractor. (5) A 28.9 h.p. four cylinder model "20" industrial tractor with buffer equipment, for general road haulage 12 tons, and manipulating of rail wagons on sidings, etc., to a gross tonnage of 150 tons.

Jowett Cars, Ltd., Bradford Road, Idle, Bradford. Stand No. 114. On the 7 h.p. two cylinder Jowett chassis will be mounted various bodies as follows:—(1) A van on the long wheelbase model; (2) on a similar model a box body; (3) on a similar model a lorry with fabric cover and (4) on a similar model a fabric covered saloon.

Karrier Motors, Ltd., Karrier Works, Huddersfield.



AN EXAMPLE OF THE KARRIER "KWF6" LARGE CAPACITY SIX WHEELER.

Stand No. 77. This firm will exhibit three examples of their passenger carrying range and four goods models, which will give the visitor some little idea of the comprehensiveness of the firm's next year's programme, which will include six passenger models with seating capacities of from 20 to 68 and 12 goods models for loads of from 2 to 12 tons. Dealing first with the goods vehicles to be exhibited they are as follows:—(1) A 2-ton flat lorry "CY2" to the order of J. Gilroy & Sons, Ltd., South Shields. It is a standard production incorporating a 26/40 h.p. engine and is mounted on 34 in. by 7 in. pneumatic tyres. (2) A 2½-ton chassis "CYR" which is a comparatively new model. It has a 9 ft. wheelbase, low loading platform and appeals to municipal authorities. It is mounted on 26 in. by 5 in. solid tyres and has a turning circle of 30 ft. (3) A 9-ton flat lorry "KWF6," which is an example of the firm's largest goods carrying six wheeler. It has been built to the order of Jacks Motors, Ltd., of Blackburn. The engine develops up to 80 h.p. The brakes are servo assisted and the chassis is equipped with 42 in. by 9 in. pneumatic tyres. The machine is equipped with a special wheel-lifting device. (4) A 10-ton tractor and trailer built to the order of the L.M. & S. Railway Company. This is an entirely new goods model comprising a four wheel tractor with an automatically coupling six wheel trailer. It incorporates a medium powered engine, 31/47 h.p., and an eight-speed gear box. The turning circle is only 20 ft. With regard to passenger vehicles there will be:—(1) A 32-seater single-deck bus ("Chaser 4"), built to the order of the Halifax Corporation. This is a new chassis built for speed, safety and comfort. The engine is a four cylinder model of 51/66 h.p. Brakes are servo assisted and the tyres are 36 in. by 6 in pneumatics. A six cylinder engine of 63/93 h.p. can be fitted to this model as alternative. (2) A 60-seater double-deck electric trolley bus being a repeat order from the Doncaster Corporation. (3) A 68-seater double-deck bus chassis known as the "Consort." This is the firm's largest six wheel passenger chassis, the six cylinder single sleeve valve engine of which develops high power without noise or vibration. The chassis is servo braked and its tyres are 36 in. by 8 in. Speaking generally of Karrier models the firm announce that not only will they have a greater variety of models but the products will be of higher quality, many detail improvements having been incorporated and at the same time there has been a reduction in prices. Engine efficiency has been increased with a resultant improvement in petrol and oil consumption in addition to gain in horse power. In certain models the "Cone-cum-plate" type clutch has been embodied giving smooth pick-up and easy gear changing. With the exception of the "CYR" low loader, which is mounted on solid tyres only, all goods carrying models can be mounted on either solid or pneumatic tyres. All pneumatic tyred vehicles include each an electric lighting set as part of its standard equipment. The firm's new range of goods vehicles will include four additions, namely—A medium capacity six wheeler (M6) designed to carry 5-ton loads over roads or 3-ton loads across country. This vehicle is more sturdily constructed than the WO/6 and is fitted with a more powerful engine. The second model is a forward drive 5-ton four wheel "GH5." Third model a 9-ton rigid frame six wheel "KWF6" and a fourth is a tractor chassis "TT" for hauling specially designed 6, 10 or 12-ton Karrier trailers. The last two, as stated above, are to be exhibited.

F. Kenning & Sons, Clay Cross, Derbyshire. Stand No. 36. A farm and estate lorry mounted on Morris commercial 35/40 cwt. chassis, 11 in. wheelbase. Interior dimensions: 9 ft. by 5 ft. 6 in. by 5 ft. high, fitted with fixed lower sides and front boards, to which are mounted detachable slatted frames. A removable tilt framed up with ash bends and covered in waterproof Dutch cloth is then fitted. Roll-up curtain being supplied all round between the tilt and fixed lower sides. The tailboard is designed to form a loading ramp being doubly hinged to give a better angle when in position for loading. Two ramp supports are supplied, carried under the body when not in use, and a hand operated end tipping lorry also on a Morris commercial 30 cwt. chassis, and a Karrier "GH.5" 4-ton heavy duty lorry.

W. H. Knibbs & Son, Limited, Tipping Street, Ardwick, Manchester. Stand No. 95. The exhibit will consist of a 32-seater service bus, mounted on a Crossley "Eagle" forward drive chassis. The body is of the dome back pattern, constructed on the "Knibson" system, a feature of which is the utilisation of armoured plywood for the pillars and for the principal members of the framework. The pillars are flexibly connected to the cross bearers, which are also of armoured wood, and practically all joints throughout the structure are bolted. "Duralumin" is largely used for the brackets, stiffening plates, etc., as weight reduction has been very carefully studied.

Laffly (England) Co., Ltd., 20-26 Lonsdale Road, London, N.W.6. Stand No. 25. The exhibit will be as follows:—(1) A special passenger chassis with six cylinder engine, 90 m.m. bore by 130 m.m. stroke, chassis weight

Digitized by Google

½3 cwt., wheelbase 16 ft. 5 in., disc wheels with pneumatic tyres 36 in. by 6 in., a spare wheel, but without tyre, and spiral bevel rear axle. (2) A similar chassis to above but with a 12 ft. 9½ in. wheelbase. (3) A 5-ton commercial chassis with engine similar to above, a 14 ft. 9 in. wheelbase, disc wheels with 38 in. by 7 in. single tyres front and 970 by 160 twin rear. Spiral bevel rear axle, servo brakes to all wheels. (4) A motor road sweeper. (5) A road washing and watering machine, 725 gallons capacity and (6) A 26-seater chassis with engine similar to exhibits 1, 2 and 3.

Latil Industrial Vehicles, Ltd., Stevenage Road, Fulham, London, S.W.6. Stand No. 129. The exhibit will be exceptionally comprehensive, there being no fewer than nine models staged:—(1) A 30/35 cwt. "B" type low loading chassis having a four cylinder monobloc engine 85 m.m. bore by 130 m.m. stroke; governed; lubrication by pump; Solex carburetter, gravity fed; magneto ignition; single disc clutch; four-speed gear box; disc wheels 955 m.m. by 155 m.m. with pneumatic tyres, weight of chassis 28 cwt. Price £350. (2) A 2-2½-ton "K.B.2." type lorry with a four cylinder monobloc engine 90 m.m. bore by 130 m.m stroke. Other particulars the same as for exhibit (1) but with tyres 36 in. by 6 in. front and 38 in. by 7 in. rear. Weight of chassis 34 cwt. Price, complete with electric light and starter, £620. Chassis only with tyres, £495. (3) A 5-ton "N.P.5.L.L." low loading, front wheel drive, platform lorry body. This is fitted with a four cylinder engine 105 m.m. by 140 m.m. stroke. It is similar to the foregoing but has Autovac feed. The chassis has a four speed gear box. The footbrake

THE LATIL 50-CWT. CHASSIS.

operates in a drum on the transmission to the front wheels and the hand brake in drums on the rear wheels. It has detachable disc wheels 34 in. by 7 in. front and 24 in. by 5 in. twin solid rear. Fitted with a driving cab and platform lorry the price is £830; chassis only, with tyres, £695. (4) A 5-ton "B.2.T." type road tractor and trailer with automatic instantaneous coupling and automatic braking. The engine is similar to that of exhibit (1). There are a four-speed gear box, worm and sector steering, semi-elliptic springing, disc wheels, 835 m.m. by 135 m.m. pneumatic single front and twin rear tyres, tractor wheelbase 7 ft. 6 in., weight of tractor 1 ton 12 cwt., trailer 1 ton 17½ cwt.; price complete, as shown, £800, or tractor £495, and trailer £165. (5) A 10-ton 'K.T.L." four wheel drive and four wheel steering agricultural and road tractor chassis. Engine similar to that of exhibit (2). There are low and high ranges of three gear speeds giving six speeds forward and two reverse. The foot brake operates on a transmission drum, and the hand brake on drums on all four wheels. There are 36 in. by 6 in. pneumatic tyres on disc wheels. (6) A similar chassis but fitted with a body incorporating a driving cab with provision for ballast. Price, with electric lighting and trailer brake, £755. (7) A 6-ton "B.5" type express normal drive lorry with a four cylinder monobloc engine 105 m.m. bore and 160 m.m. stroke. This chassis has disc wheels with 40 in. by 8 in. pneumatic tyres, single front, twin rear. Wheelbase 13 ft. 6 in. Chassis price, £925. (8) A similar chassis but with 16 ft. 10 in. wheelbase, carrying an express delivery van, price £1,380 complete, or £990 chassis only. (9) A 30-ton "T.A.R.4." type four wheel drive, four wheel steering tractor with a four cylinder monobloc engine 124 m.m. bore by 160 m.m. stroke; mounted on artillery wheels 1,160 m.m. by 130 m.m. with twin solid tyres all round. Chassis price £1,250.

Leyland Motors, Limited, Leyland, Lancashire. Stand No. 44. Passenger and goods vehicles produced by this famous firm will be represented by the following exhibits:—(1) A four cylinder "Lion" single-deck bus with overhead valve four cylinder engine, 4¼ in. bore by 5½ in. stroke; R.A.C. rating 28.9 b.h.p. at 1,000 r.p.m. 43; cylinders—monobloc with centrifugally-cast liners; ignition—coil or magneto; clutch—single plate Ferodo lined with clutch stop; change speed mechanism—operated by patented single-rod control, from spherically mounted change-speed lever mounted on engine crankcase; gear box—four speeds forward and one reverse; transmission—by tubular propeller shafts and Spicer couplings; rear axle under-slung worm; brakes—four pairs shoes in rear wheels, two pairs in front wheels, foot brake operates through Dewandre Servo to all four wheels and hand brake on rear wheels only; hydraulic shock absorbers fitted on front axle; tyres—38 in. by 8½ in. balloons, single and twin. Chassis weight 2. 18. 2. Wheelbase 16 ft. 7 ins. Front track 6 ft. Rear entrance 26-seater body of the "Comfort" type with emergency door at off-side front; interior moulding finished walnut with interior panels covered with moquette to match the armchair seats. Interior fittings include luggage rails, rug rails, Flambeau lamps and foot rests. (2) A six cylinder "Titan" double deck bus with overhead valve six cylinder engine; 4 in. bore by 5½ in. stroke; R.A.C. rating 38.8; b.h.p. at 1,000 r.p.m. 50; Other particulars as above excepting tyres 36 in. by 8 in. singles on front, 34 in. by 7 in. twins on rear. Chassis weight 3. 0. 0. Wheelbase 16 ft. 6 ins. Front track 6 ft. 6 ins. The "Titan" double-deck body seating 24 on the bottom deck and 24 on the top deck;. mahogany finished mouldings; interior upholstered in moquette and antique hide; 7-step staircase completely enclosed; emergency exit facilities for both decks. (3) A six cylinder "Buffalo" 6-ton chassis (of entirely new design). Overhead valve six cylinder engine; 4 in. bore by 5½ in. stroke; R.A.C. rating 38; b.h.p. at 1,000 r.p.m. 50; cylinders—monobloc with centrifugally-cast liners; ignition—coil or magneto; clutch—single plate Ferodo lined with clutch stop; change speed mechanism change speed lever spherically mounted on the gear box; gear box—four speeds forward and reverse; transmission—by tubular propeller shafts and Spicer couplings including the well-known Leyland spherical thrust; rear axle—double-reduction full-floating type; ratio 7.15 to 1; brakes—four pairs of shoes in rear wheels and two pairs in front wheels, pedal operates through two Dewandre Servos on all four wheels; shock absorbers—fitted to front axle; tyres—40 in. by 8 in. pneumatic tyres single and twin; chassis weight 4. 0. 0. Wheelbase 16 ft. 9 ins. Front track 6 ft. 2¼ ins. (4) A "Hippo" 12-ton rigid six wheeler of entirely new design. Overhead valve six cylinder engine; 4.9/16 in. bore by 5½ in. stroke; R.A.C. rating 49.8 b.h.p. at 1,000 r.p.m. 72.7; cylinders—monobloc with centrifugally-cast liners; ignition—coil or magneto; clutch—single plate Ferodo lined with clutch stop; change-speed mechanism—operated by patented single-rod control, from spherically mounted change-speed lever mounted on engine crankcase; gear box—four speeds forward and one reverse; transmission—by tubular propeller shafts and Spicer couplings; rear suspension—two axle bogie employing single spring suspension, the axles being of the overhead worm type; ratio 9.33 to 1; brakes—four brake shoes in each bogie axle, two pairs in front wheels, foot brake operates via 3 Dewandre Servos to all road wheels, and hand brake with special ratchet gear to the wheels of the bogie only; tyres—40 in. by 8 in. singles on the front and twins on each axle of the bogie. Chassis fitted with special tilt van body 22 ft. by 7 ft. 3 ins. by 6 ft. high. Chassis weight 5. 10. 0. Wheelbase 17 ft. to bogie centres. Front track 6 ft. 2¼ ins.

London Lorries, Ltd., Spring Place, Kentish Town, London, N.W.5. Stand No. 92. The exhibits will consist of (1) A "Euston" 19-seater saloon mounted on an Albion "Viking Six" 36/90 h.p. overtype chassis. This saloon will have a "Plein Azur" mechanically operated flexible sliding roof and staggered pullman seats. (2) A "Northumbria" 26-seater saloon mounted on a Maudslay M.L. 7a six overtype chassis with roof similar to above, De Luxe seats and folding tables. (3) "Solway" 20-seater saloon mounted on a Gilford C.P.6 chassis, roof similar to above and standard seating. (4) An "Oxford" 14-seater saloon on Chevrolet chassis, roof similar to above and standard seating.

Maudslay Motor Co., Ltd., Parkside, Coventry. Stand No. 46. This firm's activities are centred principally upon six cylinder passenger omnibuses and coaches and also on 10-ton rigid six wheeled lorries. The exhibits will comprise:—(1) A six cylinder 50-passenger covered top

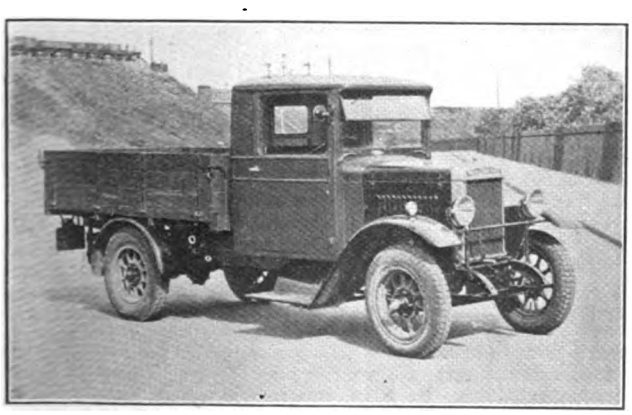
Digitized by Google

double-deck omnibus (chassis M.L.7. type). Engine: 45-120 h.p. 110 m.m. bore by 130 m.m. stroke; load capacity, 50 passengers; wheelbase, 16 ft. 6 in., track, 5 ft. 9½ in. rear, 6 ft. 2¾ in. front; wheel sizes, front and rear, 20 in.; tyre equipment, giant pneumatics, 36 in. by 8 in. single front, 38 in. by 9 in. twin rear. Unladen weight, 5 tons 10 cwt. 2 qrs. Price complete, as shown, £2,055. Chassis with tyres, £1,205. (2) A six cylinder 33-seater saloon coach with "Plein Azur" sliding roof (chassis M.L.7. type). Engine: As above. Load capacity, 33 passengers; wheelbase, 16 ft. 6 in.; track, 5 ft. 9½ in. rear, 6 ft. 2⅜ in. front; wheel sizes, front and rear, 22 in.; tyre equipment, giant pneumatics, 38 in. by 8.25 in., single front, twin rear. Unladen weight, 5 tons 3 cwt. Price complete, as shown, £1,855. Chassis with tyres, £1,205. (3) A six cylinder 26-seater Sun-Ray omnibus (chassis M.L.7. type). Engine: As above. Load capacity, 26 passengers; wheelbase, 16 ft. 6 in.; track, 5 ft. 9½ in. rear, 6 ft. 2¾ in. front; wheel sizes, front and rear, 22 in.; tyre equipment, giant pneumatics, 38 in. by 8.25 in., single front, twin rear. Unladen weight, 5 tons 2 cwt. Price complete, as shown, £1,855. Chassis with tyres, £1,205. (4) A six cylinder chassis. Engine: 45-120 h.p.; track, 5 ft. 9½ in. rear, 6 ft. 2¾ in. front; wheel sizes, front and rear, 22 in.; tyre equipment, giant pneumatics, 38 in. by 8.25 in. single front, twin rear. Weight, 3 tons 8 cwt. 2 qrs. Price, chassis with tyres, £1,205. (5) A four cylinder rigid six wheel 10-ton platform lorry. Engine: 40-75 h.p. 5 in. bore by 6 in. stroke; load capacity, 10 tons; wheelbase 16 ft. 6⅛ in., from front to driving wheels, 720 m.m., driving and trailing wheels, 850 m.m.; tyre equipment, solid rubber tyres, 180 m.m. section, single on front and trailing wheels, twin on driving wheels. Unladen weight, 6 tons 8 cwt. 1 qr. Price complete, as shown, £1,460. Chassis, with tyres, £1,285.

Metcalfes (London), Ltd., 189 Regent Street, London, W.1. Stand No. 35. The exhibits will consist of (1) a long distance coach body to seat 26 passengers. The seats have high rigid backs and down stuffed pillows adjustable to the position of the head. Rawlings window fittings are used and all windows are made to drop. It is mounted on a Guy 16 ft. 7 in. wheelbase O.T. chassis. (2) The firm's standard 31-seater "Mastiff" omnibus body with two folding doors on the near side. Rawlings window fittings. Spring steel seats with detachable cushions. Mounted on an A.J.S. chassis. (3) A 20-seater all-weather coach body with Hemmings cantrail and sliding sticks, Rawlings window fittings and fixed dome back.

Minerva Motors (England), Ltd., Minerva House, Chenies Street, London, W.C.1. Stand No. 70. Minerva exhibits will be as follows:—(1) A 60 h.p. coach chassis with sleeve valve engine, forced feed lubrication, oil cooling, multi plate dry clutch, four-speed gear box in unit with engine, petrol pump supply to carburetter, magneto ignition, Dewandre four wheel brakes and spiral bevel full floating rear axle. Load capacity 5 tons. (2) A four cylinder coach type M.B.R. chassis with a 26-seater all-weather body.

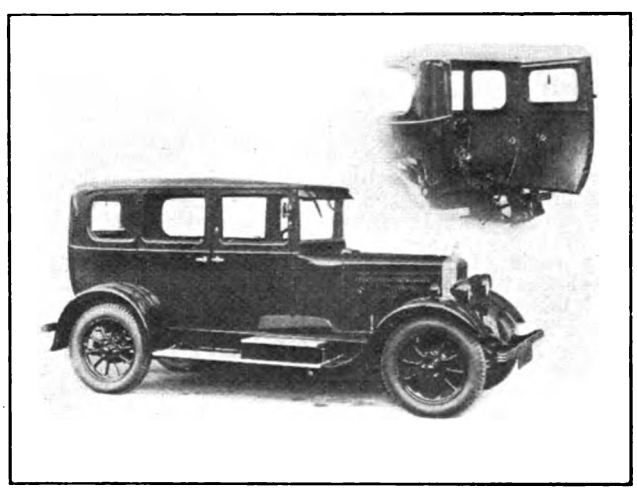
Morgan Hastings, Ltd., 42 Sussex Place, South Kensington, London, S.W.7. Stand No. 85. The exhibit will consist of a Stewart 20-seater bus, the chassis having a six cylinder engine, full floating axle, underslung springs, four wheel brakes, four speeds and large generator and battery. (2) A Stewart 4-ton chassis with six cylinder engine, full floating worm axle, Bendix four wheel brakes, multiple gear giving 12 forward speeds and three reverse, price £1,045.



THE MORRIS COMMERCIAL 30-CWT. TRUCK.

Morris Commercial Cars, Ltd., Foundry Lane Works, Soho, Birmingham. Stand No. 118. There will be the following exhibits:—(1) A one-ton truck complete for £198 ready for the road. (2) A 30 cwt. truck fitted with standard body, price £249 10s. (3) An "R" type ambulance. Price, complete with accommodation for two stretcher and five or six sitting patients, £440. (4) A 50 cwt. "Leader" chassis, an entirely new model to be seen for the first time at Olympia. It is particularly suitable for overseas conditions. It has a new four cylinder engine 95 m.m. bore by 125 m.m. stroke and develops 60 b.h.p. (5) A "Viceroy" 20-passenger coach which is also an entirely new model. It has a six cylinder engine developing 70 b.h.p. and a speed of 60 m.p.h. is attained. It has a special luxury type body. (6) Another entirely new model known as the "Dictator" 28-passenger chassis. This also has a six cylinder engine and a worm driven rear axle. The engine develops 110 b.h.p. (7) A 2-ton six wheeler, already known to the majority of our readers, chassis price £465 and (8) the "London" taxi-cab built to comply with Scotland Yard regulations, price £395.

Morris Motors, Ltd., Cowley, Oxford. Stand No. 116. There will be six exhibits these being:—(1) A commercial traveller's saloon mounted on a standard Morris-Cowley chassis. There will also be two new 5 cwt. vans, fitted with 8 h.p. overhead valve engines, and two 10 cwt. light vans. In addition there is to be an 8 h.p. fire-fighting tender, this being a modified 5 cwt. chassis equipped with a body designed to carry light fire extinguishing appliances.



THE MORRIS COMMERCIAL TRAVELLER'S SALOON.

Northern Counties Motor & Engineering Co., Ltd., Wigan Lane, Wigan. Stand No. 19. This firm of coach builders will exhibit as follows:—(1) A single-deck omnibus to the design of the Morecambe Corporation Tramways mounted on a Maudslay M.L.3 chassis. Seating accommodation for 32 passengers in bucket seats. (2) A single-deck front entrance omnibus body mounted on an Albion overtype chassis. (3) An all-weather pullman saloon coach with patent sliding head, mounted on a Bristol four cylinder overtype chassis.

F. W. Plaxton, Castle Works, Scarborough. Stand No. 97. This is a body building exhibit and will include (1) a 20-seater de luxe all-weather body with "Triumf-ed" patent sliding roof, Newtex safety glass throughout, mounted on a Star "Flyer" chassis. (2) A 32-seater service bus mounted on a Halley "Conqueror" chassis. (3) A 14-seater de luxe all-weather coach with head as No. 1 exhibit. Settee armchair seating. Mounted on a six cylinder "Whipper" chassis.

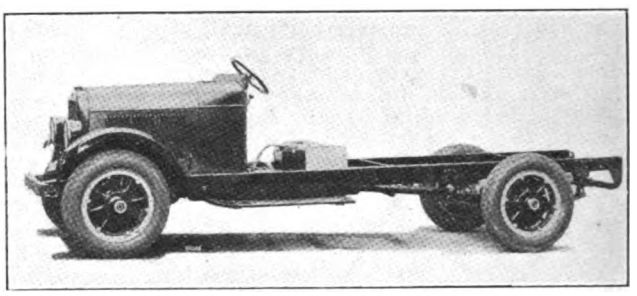
Ransomes, Sims and Jefferies, Ltd., Ipswich. Stand No. 52. (1) A 32-seater service bus body, of the single-deck saloon type, mounted on Karrier "JKL" forward drive type chassis. The body has a domed rear end with two doors on the nearside and an emergency door on the offside. There are four on each side arranged to drop and controlled by Rawlings side-lock fittings. Eave ventilators are also fitted and three Muirhead ventilators in the roof. The seats are of the rigid semi-bucket type. Signalling is by means of Numa air bell, and the interior fittings are silver oxidised and chromium plating, the exterior fittings being chromium plated. This vehicle has been purchased by the Alfreton Motor Transport Co., Alfreton. (2) A

Digitized by Google

32-seater service saloon bus body, mounted on a Thornycroft B.C. forward drive six cylinder chassis. The body is of the single-deck domed rear end type, with front entrance with folding door, and rear emergency door. All windows, six on the offside and five on the nearside, are drop windows, operated by Rawlings side-lock fittings. Eave ventilators are fitted, and automatic ventilators in the roof. The seating accommodation is of the (rigid) semi-bucket type. The general interior finish is black cellulose with black oxidised fittings, the lamps being of the flush type with moonstone bowls. Continuous parcel racks are also fitted, and signalling is by means of Numa air bell. All exterior fittings are chromium plated. (3) A Ransomes' type "D6" six wheel electric trolley bus chassis. The chassis is of the six wheel type, mounted on 36 in. by 8 in. pneumatic s/s. Dunlop cord tyres. The bogie is constructed upon the Thornycroft patent system, the double pivoted springs on each side. The motor, manufactured by Ransomes, Sims & Jefferies, Ltd., is of the twin type, having two armatures running in a common casing. The motor gives 80 b.h.p. on the British Standard Specification rating, and has considerable overload capacity. The motor is arranged for series parallel control. The steering is of the Marles type. The brakes are of the internal expanding type, acting on large diameter drums. The chassis is designed to take a double-deck, top-covered body to seat 60 passengers and is one of six being supplied to the Nottingham Corporation Transport Department.

Renault, Ltd., Western Avenue, Acton, London, W.3. Stand No. 74. The exhibits will consist of the following:—(1) A six cylinder 7-cwt. traveller's brougham with 12.5 h.p. engine. (2) A type "KZ" 12-cwt. traveller's brougham with a four cylinder 45 b.h.p. engine. (3) A type "O.S." 24-cwt. enclosed van with 14/45 h.p. engine, three speed gear box, wheelbase 10 ft. 3 in., track 4 ft. 9 in., four wheel brakes, lighting and starting equipment, disc wheels with 835 by 135 pneumatic tyres. Chassis price £189, price complete £282. (4) A 37-cwt. lorry with 14/45 h.p. engine, four speeds, 37 cwt. useful load, wheelbase 11 ft. 9½ in., 5 ft. track, four wheel brakes, lighting and starting, mounted on 835 by 135 tyres, single front, twin rear. Price complete £335, chassis only £259. (5) A 20-seater luxury coach type "SX" with 21 h.p. engine, four speed gear box, wheelbase 12 ft. 5½ in., track 5 ft. 0⅜ in. Standard equipment includes:—four wheel brakes, lighting and starting, spare wheel and tyre. Price £895, chassis price £359. (6) A six cylinder 26-seater sunshine luxury coach with 26.9 h.p. engine, R.A.C. rating, four speed gear box, wheelbase 16 ft. 1 in., front track 6 ft. 1 in. Equipment as above but with servo brakes, 36 in. by 6 in. pneumatic tyres twin rear. Price complete £1,495. Chassis price £723. (7) A type S.1. 31/32 seater sunshine luxury coach, engine 45 h.p., bore and stroke 110 by 160 (Treasury rating 45 h.p), four speed gear box, chassis weight 2 tons 18 cwt., wheelbase 16 ft. 5 in., track 5 ft. 10¾ in. Standard equipment: four wheel servo brakes, lighting and starting, six detachable steel disc wheels, fitted with 38 in. by 7 in. straight side pneumatic tyres twin at rear, and coach body as above. Fitted with full equipment suitable for long distance operation, price £1,795. (8) A four cylinder road tractor with 14/45 h.p. engine, three speed gear box, drawbar pull 1 ton 5 cwt., weight 2 ton 5 cwt., solid rubber tyres. Price £395. (9) A 5-ton hydraulic tipping lorry with 24.8 h.p. engine, four speed gear box, servo brakes, solid tyres on disc wheels and Wood's tipping gear. Price £870 complete, chassis £660.

Reo Motors (Britain), Limited, Beavor Lane, Hammersmith, W.6. Stand No. 63. Reo will exhibit four chassis, two complete coaches and one bus at Olympia. A model DA 30 cwt. 10 ft. 7 in. wheelbase chassis selling at a new low price of £298 will be on the Reo stand, as well as a model FE 2-ton 12 ft. 8 in. wheelbase chassis selling at £445, as model FD 2½-ton 14 ft. wheelbase chassis, with twin rears priced at £545, and a model GE 26-seater bus chassis, twin 32 by 6 rears, 14 ft. 11 in. wheelbase, equipped with large dynamo, large accumulator and voltage control. The price of this vehicle is £695. It meets the requirements of Scotland Yard and can be licenced for the Metropolitan area. There will be three complete jobs: a 26-seater "All-weather" coach built by Wrays of Walham Green. This coach has a sliding head roof. The chassis used is of the GE type. There will be a 20-seater service bus on an FB chassis, the body being built by H. E. Taylor of the Eaton Coachworks, Cringleford. There will be a 20-seater De Luxe all-weather coach on a GE chassis, built by H. Norman Pitt & Co., of Amesbury. A special feature of this stand will be the new Reo Gold Crown engine for which are claimed an excess of horse-power for its piston displacement; high horse-power at low speeds (67 horse-power at 2,800 r.p.m.) and high torque at low engine speeds, and that its medium compression turbulence type head and its automatic air valve design carburetter permit the use of all types of petrol. The seven-bearing crankshaft is statically and dynamically balanced and is equipped with Lanchester type vibration damper. Aluminium alloy pistons are used for greater heat conductivity and in the interest of light reciprocating parts. There is full pressure lubrication with oil filter. Special air cooling under the pan keeps the air cool. There are thermostatic control of the cooling, a water



THE 30-CWT. REO SPEED WAGON COMMERCIAL CHASSIS.

temperature gauge and an oil gauge on the dash. Different gear ratios and tyre sizes are fitted to the chassis using the Gold Crown engine, to fit them for the service for which they are intended. The heavy speed wagon models have four forward speeds. Four wheel, two shoe, internal expanding hydraulic brakes are used. All speed wagons are equipped with electric starters and are fully electric lighted.

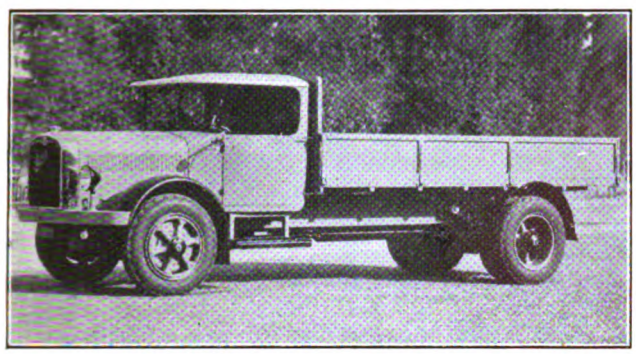
Wm. & Thos. Robson, Ltd., 60 Farringdon Road, E.C.1. Stand No. 80. (1) A "Robson Light-Weight" box van body mounted on "Albion" 20/36 h.p. high-speed 30 cwt. chassis. In patent method of construction with light hardwood framing, strengthened with metal channels, etc., aluminium panels; interior slatted; double doors at back; partition and sliding door behind driver's seat; enclosed front with full depth side doors with drop lights and mechanical winders, and sloping windscreen in metal frame. (2) A "Robson" tilt van body mounted on "Dennis" 30 cwt. chassis. With oak and ash framing; aluminium panels; interior close boarded; hoops boarded and covered with prepared cloth; double doors at back; interior fitted with detachable shelves; partition and sliding door behind driver's seat; wind doors and full glass windscreen. (3) A "Robson" box van body mounted on "Trojan" 7 cwt. chassis; suitable for general purposes; double doors at back; wind doors to open; finished in cellulose.

Rushton Tractor Co. (1929), Ltd., Forest Road, Walthamstow, London, E.17. Stand No. 100. The Rushton tractor will be exhibited for the first time at Olympia. There will be five models equipped as follows:—(1) An industrial tractor mounted on giant pneumatic tyres with two-seater driver's cab insulated by full chassis and half elliptic springs, and the equipment will include a dynamo lighting set, etc. This machine is designed to haul loads of from 5 to 7 tons at a speed in excess of 20 miles per hour. The retail price is £300, cab £30 extra. (2) An industrial tractor mounted on solid tyred wheels. The equipment of this machine is much heavier than exhibit 1 and is designed to haul a load of 10 tons at a speed of 10/12 m.p.h. The retail price is £265, with cab £30, and lighting set £11 10s., both extra. (3) A roadless tractor equipped with two-speed winch for all kinds of soft ground haulage, haulage of timber and similar operations where an ordinary wheel tractor would be incapable of working owing to lack of wheel grip. Price £541. (4) A solid tyred industrial tractor fitted with buffer attachment to use in works for shunting operations. Price £290. (5) An industrial tractor equipped with loading shovel for lifting and loading all types of loose materials. Price £507.

Saurer Commercial Vehicle Co., Ltd., 21 Augustus Street, Albany Street, London, N.W.1. Stand No. 32. There will be five chassis as follows:—(1) A standard chassis of the well-known 6-ton "5AD" type, which has given eminently satisfactory service in the hands of some of the largest and most experienced transport operators in this country, and which, therefore, hardly calls for special description. (2) A new 7/8-ton chassis type "6BLD" with Saurer heavy oil engine, on Saurer-Simplex steel wheels and 40 in. by 8 in. pneumatic tyres. (3) A new Saurer six cylinder low frame 30-seater passenger chassis type "3BNPL" on 36 by 8.25 pneumatic tyres and Saurer-Simplex steel wheels. (4) A complete 17-seater

Digitized by Google

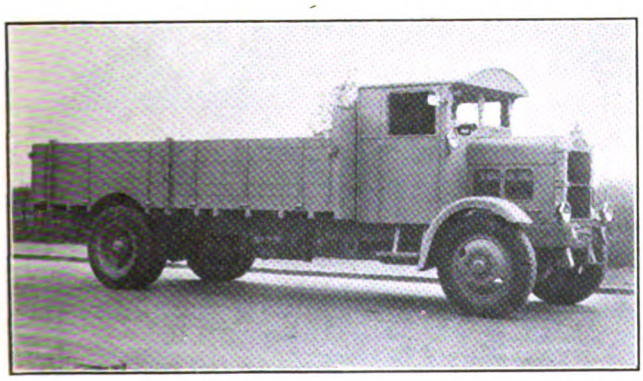
Saurer coach. This vehicle, which is comfortably and luxuriously appointed, affording an unusual amount of leg room, is exactly as used by the Swiss postal authorities for their Alpine coach services. The body, of Saurer construction, is fitted with electrically-operated hood which is operated by the driver without leaving his seat. The chassis on which the body is mounted is of the same type as the one described above, but having a wheelbase



THE SAURER "6BLD" LORRY WITH HEAVY OIL ENGINE.

of 15 ft. 7 in. and a larger engine, with a bore of 110 by 150 m.m. (5) A standard chassis type "6BLD" with Saurer heavy oil engine, with wheel and tyre equipment as on chassis described in (2). Fitted with Scintilla 12-volt. electric lighting set; electric starter; speedometer; Saurer combined trailer hook and automatic trailer brake operating gear; front bar for manoeuvring trailers, and, to conform with regulations, the Saurer patent trailer brake control gear. They will also be showing a crankshaft as used in the engine of the "6BLD" chassis, complete with ball-bearings and flywheel.

Scammell Lorries, Ltd., 14 Holborn, London, E.C.1. Stand No. 51. There will be four exhibits as follows:—(1) The Scammell eight wheeler for carrying loads of from 15 to 20 tons at an average speed of 12 miles an hour. In this machine is incorporated the patented Scammell carrier axle, in which there are two axles in line across the vehicle, each axle carrying a pair of wheels and oscillating on longitudinal bearings so that all four wheels follow the camber of the road. The engine is of the overhead valve type, developing about 70 h.p. The gear box provides four speeds forward and reverse. The engine and gear box are carried on a sub-frame supported at three points on the main frame. The transmission embodies a bevel driven countershaft, carried by the motive unit frame, from sprockets on the end of which the drive is transmitted to the road wheels through Duplex roller chains. All road wheels are the hollow spoke type mounted on Timken roller bearings. (2) A four wheeler which is an entirely new exhibit with engine and gear box the same as on other Scammell products. It is intended for 6-ton loads and can haul a trailer with



THE NEW SCAMMELL 6-TONNER.

an additional 6 tons. It is mounted on 40 in. by 8 in. single pneumatic tyres, twin rear. The wheels are special cast steel of the detachable type. The transmission is by universally jointed propeller shaft to a Kirkstall worm gear rear axle. (3) A 10-ton articulated pneumatic tyred six wheeler. The tyres are 40 in. by 8 in. twins on rear wheels. The carrier in this instance is a frameless tanker provided with five compartments for carrying 2,500 gallons of petrol. It is fitted with the Shell-Mex special safety filling arrangements and draw-off cocks. (4) A rigid six wheeler being an improvement on the previous model. It embodies a pivotted front axle and the special Scammell single axle rear bogey with rocking balance beams. New features include a five-speed gear box, a Scammell "Still" radiator, double hand brake control and a special tyre pump.

G. Scammell & Nephew, Ltd., Fashion Street, London, E.1. Stand No. 91. There will be shown mounted on a Halley 4-ton chassis a flat platform body 14 ft. 6 in. long behind driver's seat 6 ft. 6 in. wide with tailboard shaped and of sufficient depth for lettering. It will have a saloon cab separated from the body with rise and fall windows. Mounted on a Commer 4-ton chassis is to be a solid top body 13 ft. 6 in. long, 6 ft. 8 in. wide and 6 ft. 3 in. deep in centre. The top comprising 6 hoops close boarded and stretched canvas bedded in white lead. There will be bacon hanging rails fitted to the inside. A third exhibit will be a special open body 11 ft. 6 in. long by 6 ft. 6 in. wide, mounted on a Dennis 50 cwt. chassis.

"Sentinel" Waggon Works, Ltd., Shrewsbury. Stand No. 130. (1) A 10/15-ton D.G.6. rigid six wheeler flat platform wagon, for the Cement Marketing Co., Ltd., London. The engine is a "Sentinel" double-geared, two cylinders model, bore 6 in., stroke 8 in. Poppet valves, steam pressure 275 lbs., two-speed gear and differential in aluminium casing integral with crank chamber, final drive by roller chain. Single tubular rear axle carrying patent self-compensating bogie arms. "Sentinel" patent vertical water tube boiler with superheater and removable fire-box. Internal expanding brakes, eight shoes operated by steam and eight by hand. Ackermann steering. Electric lighting—chain driven constant voltage dynamo. (2) A 12-ton D.G.6.T. rigid six wheeler three-way tipping wagon, to the order of Tarmac, Ltd., Ettingshall, Wolverhampton. Body: 17 ft. 3 in. by 7 ft. 5⅜ in. 24 in. sides. Wheelbase: front to forward bogie axle 12 ft. 2⅞ in. Bogie axle centres: 3 ft. 10 in. Turning circle: 62 ft. (3) A 12/14-ton D.G.6.S.T. rigid six wheeler side tipping wagon, supplied to Messrs. Wm. Woodbridge, Ltd., Westminster, S.W.1. (4) A 6/8-ton D.G.4. wagon with sliding tilt van top to Hovis's design, for Hovis, Ltd., London. (5) A 6/8-ton D.G.4.T. three-way tipping wagon, to the order of A. J. Gupwell, Ltd., Birmingham.

Shefflex Motors, Limited, Tinsley, Sheffield. Stand No. 107. One chassis only will be on show, namely, a 2½-ton standard model, fitted with pneumatic tyres, though the 2-ton and 2½-ton standard, semi-forward steering and low loading refuse collecting chassis, will be marketed in the coming season. The four cylinder engine is used, and minor alterations have been carried out, such as improved inlet manifold, a new arrangement for taking oil laden vapour from the crankcase through the carburetter to ensure a measure of upper cylinder and valve stem lubrication. The position of the dynamo has been altered to the near side of the engine where previously the magneto was placed, and the magneto is carried behind the dynamo and tandem driven through same coupled by a vernier coupling. Slightly longer front springs are fitted to allow greater flexibility to the suspension and a lower loading line is obtained by the use of re-designed spring brackets. An important feature in the transmission is the use of the Hardy Spicer propeller shaft and mechanical joints.

Short Bros. (Rochester & Bedford), Ltd., Rochester. Stand No. 55. (1) A light weight all-metal constructed double-deck covered top bus body with enclosed stairs on A.E.C. type "661" chassis. It is of Short patented all-metal construction, the main framing and floors being of aluminium alloy having an ultimate tensile strength of 25 to 28 tons square inch and the panels of aluminium sheet. Amongst the advantages claimed are decreased body weight, reduced petrol consumption and wear and tear on tyres, brakes and transmission; safety from fire and collision and immunity from extreme climatic conditions. The seats for both saloons are of ample proportions, being supported on pedestal legs and have pressed steel back supports. (2) A "Corporation" type single-deck bus body on Tilling-Stevens "Express" chassis. A rear entry type body seating 31 passengers all facing forward except two each side over the wheel arches. Three windows on each side are made to drop and are operated by "Beatonson" balanced mechanism. Ample ventilation is provided by means of two large hinged ventilators in the roof and two hinged ventilators in the front bulkhead. Also a continuous metal louvre (or eave) is fitted the full length each side over the tops of the windows. Seats as in (1) above. A double-deck covered top bus on an A.E.C. chassis will be available for demonstration outside Olympia.

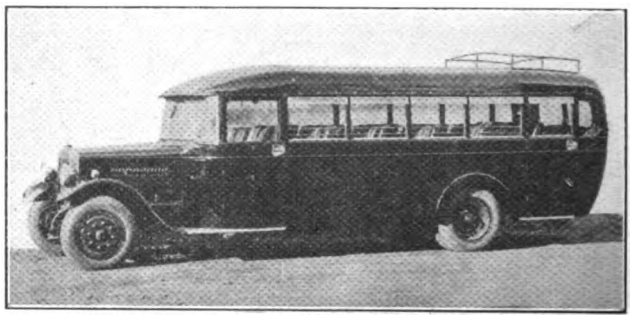
Singer & Co., Ltd., Coventry. Stand No. 47. The new Singer 2-ton industrial vehicles, as described in our last number, will be publicly exhibited for the first time. The exhibits will take the form of an industrial chassis (£425), an industrial motor complete with platform body having drop sides and tailboard and an enclosed cab (£486 10s.), and a 20-seater coach (low loading chassis) with giant pneumatic tyres (£895). In addition to these larger vehicles, there will be two Singer Junior delivery vans and a 12 cwt. van. Amongst the most interesting features of the 2-ton chassis are the number of pleasure car refinements which are incorporated in it. It has, for instance, a self-starter, Luvax "one-shot" chassis lubrication, Marles type steering and servo-operated brakes. The 20 h.p. engine, a four cylinder built in unit with the gear box, is bolted to a sub-frame at six points, the sub-frame being attached to the chassis at three points. The dimensions are 90 by 120 m.m., cubic capacity being 3,053 c.c. Push-rod operated overhead valves are employed and the detachable cylinder head is of the turbulent type. It is stated that at 3,000 r.p.m. the engine develops nearly 60 brake horse power. The right-hand controlled four-speed gear box gives ratios of 6.5, 10.5, 17.9 and 34.8 to 1, but an alternative rear-axle, giving a reduction of 7.25 to 1 is optional. In general, the specification of the passenger chassis is similar to that of the commercial chassis, but the frame is low-built and the wheelbase is 13 ft. instead of 11 ft. 1½ in. The giant pneumatics are of 7 in. section, used in twin formation at the rear, and shock absorbers are fitted all round. Specially large batteries and dynamo, also, provide for internal lighting of bus and coach bodies. The bodywork of the 20-seater coach exhibited is particularly luxurious and gives armchair comfort for the passengers. It is finished in cream and heather and upholstered in heather-coloured moquette. Each of the seats is of the semi-bucket type, having a well-sprung cushion and a head rest. Of the smaller vehicles, the Junior delivery van represents excellent value at £135. It has a load capacity of 6 cwt., its four cylinder engine having dimensions of 56 by 86 m.m. and a Treasury Rating of 7.7. h.p. The 12 cwt. van is rated at 14.7 h.p., the engine being a six cylinder, with a bore and stroke of 63 by 95 m.m. The price of the van complete is £200.

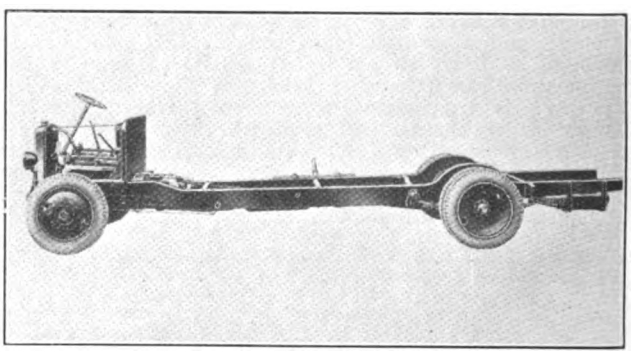
Spenborough Engineering Company, Valley Works, Heckmondwike. Stand No. 37. The subject of the exhibits will be various Spenborough tipping gears and bodies. There will be a trailer fitted with the firm's three-way tipping gear and a steel three-way tipping body. The trailer incorporates taper roller bearings, and the body has been specially designed for sand and gravel transport. Price complete, £235. Another exhibit will be a Manchester 35 cwt. chassis fitted with three-way tipping body and gear as above. The three-way tipping gear is mounted on trunnions for end tipping and for side tipping a special track arrangement is fitted on the underside of the body which during the tipping operation always allows the screws to remain in a vertical position. The sides of the body are made to fall level with the lorry platform to form a chute for tipping the materials clear of the road wheels. The price of this outfit is £335. Other exhibits will be a 6-ton Universal tipping gear, price £18. A 4/5-ton single telescopic end tipping gear, price £16. A 50 cwt. single telescopic end tipping gear with Spenborough ball aligning bracket, price £13 10s. A 50 cwt. single screw tipping gear with ball body bracket, price £8 15s. A 30 cwt. single screw, price £6 5s., and a full range of parts. There will also be hand-operated gears.

Star Motor Co., Ltd., Star Motor Works, Frederick Street, Wolverhampton. Stand No. 42. The exhibit will include the firm's new season's range of Star "Flyer" chassis, types V.B.3. and V.B.4. listed respectively at £595 and £645, and an entirely new model six cylinder low loading goods chassis listed at £545. With regard to the two "Flyer" models: the specifications remain generally unchanged though the following improvements are incorporated:—(a) Dewandre servo system standardised; (b) new shell type radiator; (c) detachable engine oil sump; (d) new instrument board; (e) lamps and radiator chromium plated; (f) improved design wings and (g) improved performance claimed. The V.B.4. "Flyer" chassis 15 ft. 6 in. wheelbase is to be offered complete as a 20-seater bus at £960 and as a 26-seater sliding head all-weather coach at £1,020. The new six cylinder low loading 2½-ton chassis has a 14 ft. 2 in. wheelbase and the specification follows closely that of the V.B.3. type "Flyer" chassis, but is equipped with 34 in. by 7 in. pneumatic tyres single all round, powerful brakes on rear wheels only, gravity feed petrol tank and 12-volt lighting set. An electric starter can be supplied at an extra charge of £8. This vehicle will be shown as chassis only. A "Flyer" chassis will be shown with an all-weather coach body, another one with a saloon bus body, a third with a two-horse box body and a fourth with a special van body.



THE LATEST V.B.4 TYPE STAR FLYER 26-SEATER ALL-WEATHER COACH.

A. J. Stevens & Co. (1914), Ltd., Walsall Street, Wolverhampton. Stand No. 138. This firm are exhibiting at the Commercial Motor Show for the first time. Their exhibits are to be as follows:—(1) A "Pilot" chassis, normal drive, suitable for mounting a 24 or 26-seater bus or coach body. Features of the chassis are the six cylinder O.H.V. engine, clean lay-out of the chassis, and the substantial construction of the whole. Three groups of "Enots" Greasers are fitted for chassis lubrication. (2) A "Commodore" chassis, forward drive is suitable for mounting a 32-seater body, or for a luxurious coach for long distance tours. The engine is of the six cylinder side-by-side valve type, rated at 36 h.p. R.A.C., and developing 75 b.h.p. at 2,000 r.p.m. (3) A complete sunsaloon parlour coach, body work by Willowbrook, Ltd., Loughborough. Luxuriously appointed, divan seats and interior finished in walnut inlaid with black. Specification as No. 1. (4) A 32-seater service saloon bus, comprising 13 double seats and two seats for three persons over each wheel arch. Specification as No. 2. (5) A 26-seater coupe-de-ville luxury saloon. Main features are:—All drop lights in side of saloon, fitted out with armchair seats and foot rests.



THE A.J.S. "COMMODORE" CHASSIS 32-SEATER CAPACITY.

Strachans (Acton), Ltd., Wales Farm Road, North Acton, London, W.3. Stand No. 62. There will be (1) a 32-seater rear entrance saloon designed for long distance operation. Special attention has been given to luggage acommodation by (a) raising the floor, thus providing luggage lockers under the whole width of the body. (b) Luggage lofts at each side of the interior roof. (c) A large locker beneath the rear seat. Ventilation has been looked after by providing hinged vents, air vacs, metal louvres and all windows made to drop. The interior furnishing provides every comfort. This body will be mounted on a Thornycroft six wheel chassis. (2) A 26-seater long distance saloon fitted with seats of new design incorporating a variable head rest, arm rests and folding tables. Metal luggage lockers on outside roof. The comfort of the passengers has been completely provided for. This body will be mounted on an Albion chassis. (3) A 32-seater front and rear entrance service saloon mounted on a Dennis chassis. Strachan bodies will also be seen on the following stands:—International Harvester, Harris & Hasell, Renault, Albion and Thornycroft.

Sunbeam Motor Car Co., Ltd., Moorfield Works, Wolverhampton. Stand No. 30. This firm are new entrants into the commercial motor manufacturing industry, they are, however, as our readers know well, world famous as manufacturers of private motor cars. They have placed on the market a 70/142 h.p. six cylinder six wheel chassis and a 52/110 h.p. six cylinder four wheel chassis, examples of which they will stage. The following are brief particulars of the chassis:—The engine develops 70 b.h.p. at 1,000 r.p.m. rising to 142 b.h.p. at 2,400 r.p.m. The cylinders have detachable heads; bore 110 m.m., stroke 140 m.m.; load capacity 6½ tons or 67/70 passengers; weight of chassis 4½ tons approximately, wheelbase 18 ft. 6 in., track 6 ft. 2⅝ in.; disc detachable wheels

THE S.M.C. 6-CYLINDER SIX WHEEL 67-SEATER DOUBLE DECK OMNIBUS.

with Dunlop 36 in. by 8 in. high pressure tyres. Overall length of chassis 29 ft., overall width 7 ft. 2 in., body space from dash board 23 ft. 6 in. Engine lubrication is on the dry sump system. Separate magneto and coil ignition systems are fitted, two sparking plugs being provided in each cylinder, thus giving completely independent ignition. The brakes are Dewandre operated. The chassis price is £1,750. A similar chassis will be exhibited with a 67-seater double-deck bus body by Christopher Dodson, Ltd. The four wheel 52/110 h.p. six cylinder chassis will be exhibited with a 26-seater body by Short Bros., Ltd. The chassis is very similar in many details of its design to the six wheel chassis. Its length is 26 ft., width 7 ft. 6 in., wheelbase 16 ft. 6 in., load capacity 5½ tons approximately, or 26/32 passengers, weight of chassis approximately 3½ tons. Body space from dash to end of frame 20 ft. 6¼ in. Detachable disc wheels with Dunlop high pressure 38 in. by 7 in. single front tyres, twin rear. Chassis price £1,275.

A. E. Tapper & Co., 100 Palmerston Road, High Road, Kilburn, London, N.W.6. Stand No. 50. Brockway vehicles will be exhibited on this stand. There will be four vehicles two of which will be 27 h.p. six cylinder models, one with a 12 ft. 5 in. wheelbase is for 30 cwt. loads, or 14 passengers, and the other with a 14 ft. wheelbase is for 35 cwt. loads or 20 passengers. Prices respectively £385 and £465. There will be the 35 h.p. six cylinder models, one for 3-ton loads or 26 passengers, price £595, and the other for 70 cwt. loads or 32 passengers, price £895.

H. E. Taylor & Co., Ltd., Cringleford, Norwich. Stand No. 123. (1) An "Eaton" 20-seater semi-de-luxe saloon on a B.A.T. 27.3 h.p. six cylinder Cruiser chassis. (2) A 23-seater all-weather saloon coach with sliding roof on a Reo chassis type G.E., and (3) a 35-seater town service omnibus on a 30/70 h.p. Crossley-Eagle four cylinder low loading line chassis.

Thompson Brothers (Bilston), Limited, Bilston, Staffs. Stand No. 89. A "T.B." lightweight elliptical Spirit Tank mounted on Leyland "Bison T.G.1." chassis, electrically welded, four compartment tank, capacity 1,200 gallons.

John I. Thornycroft & Co., Ltd., Thornycroft House, Smith Square, London, S.W.1. Stand No. 41. This famous firm's exhibits will naturally attract a very great deal of attention. There will be included a six cylinder rigid six wheeled chassis for overseas service shown for the first time. It is primarily designed for passenger work in difficult country, and is suitable, with the addition of an auxiliary gear box, for freight transport. This and a luxurious 20-seater sun saloon coach and a standard "Emerald" 20-seater omnibus complete the range of passenger exhibits. A fifth vehicle will be an example of a number of 30-cwt. box vans supplied to the Great Western Railway. The principal details of the Thornycroft exhibits are as follows:—(1) A 22/40 h.p. four cylinder type "A1" box van. Engine 3¾ in. bore by 5 in. stroke (Treasury rating 22.5 h.p.). Weight of chassis in running order 34½ cwts., wheelbase 11 ft. 6 in., track 61⅝ in., detachable wheels with 34 in. by 7 in. pneumatic tyres, spare wheel and tyre carrier, mechanical tyre pump, Miller mileometer positively driven from the gear box, 12-volt five lamp lighting set with Tyer combination oil and electric side and tail lamps, thermostat, "Alcyl" centralised chassis lubrication, air filter for carburetter, towing loops and full kit of tools. To carry a net load of 30 cwts., with a body allowance of 14 cwts. Special box van and driver's cab. (2) A 34/70 h.p. six cylinder type "A5" rigid six wheeled chassis. Engine 3¾ in. bore by 5¼ in. stroke (Treasury rating 33.8 h.p.). Weight of chassis in running order 65 cwts. Mean wheelbase 12 ft. 6 in., track 61⅝ in., detachable disc wheels with 36 in. by 7 in. pneumatic tyres, mechanical tyre pump, speedometer and mileage recorder positively driven from the gear box, 12-volt five lamp electric lighting and starting set, vacuum servo assisted brakes, auxiliary gear box, air filter for carburetter, towing loops and full kit of tools. Patented system of rear suspension permitting 12 in. difference in driving axle levels and allowing either axle to tilt to an angle of 18 degrees. To carry a net load of 3½ tons with a body allowance of 18 cwts. Price of standard chassis with standard equipment, £915. Price of chassis with subsidy equipment as shown, £935. (3) A 22/40 h.p. four cylinder type "A2 long" twenty seater "Emerald" omnibus. Engine 3¾ in. bore by 5 in. stroke (Treasury rating 22.5 h.p.). Weight of chassis in running order 43 cwts., wheelbase 14 ft., track 59½ in., detachable disc wheels with 38 in. by 9.00 in. low pressure tyres, spare wheel and tyre with carrier, mechanical tyre pump, speedometer and mileage recorder positively driven from the gear box, 12-volt five lamp bus lighting set with dipping head lamps, stop signal lamp, fog lamp, electric horn, front shock absorbers, four wheel brakes, air filter for carburetter and full kit of tools. Twenty seater "Emerald" type service omnibus body with driver-operated front door, semi-bucket seats, real furniture hide upholstery, four drop windows, roof ventilators, lifeguards and destination indicator. (4) A 41/82 h.p. six cylinder type "BC" 26-seater Sun Saloon coach. Engine 4⅛ in. bore by 5¼ in. stroke (Treasury rating 40.8 h.p.). Weight of chassis in running order 68 cwts., wheelbase 16 ft. 6 in., track 75 in., detachable disc wheels with 38 in. by 8.25 in. low pressure tyres, spare wheel and tyre with carrier, mechanical tyre pump, speedometer and mileage recorder positively driven from the gear box, 12-volt five lamp bus lighting and starting set, with dipping headlamps, stop signal lamp, fog lamp, electric horn, front shock absorbers, vacuum servo assisted brakes, front bumper bar, air filter for carburetter and full kit of tools. (5) A 41/82 h.p. six

A THORNYCROFT 30-CWT. TYPE "A1" BOX VAN.

cylinder type "HC forward double deck" 68-seater rigid six wheeled covered top omnibus. Engine 4⅛ bore by 5¼ in. stroke (Treasury rating 40.8 h.p.). Weight of chassis in running order 94½ cwts., mean wheelbase 18 ft. 0 in., track 75½ in., detachable disc wheels with 36 in by 8 in. pneumatic tyres, spare wheel and tyre with carrier, mechanical tyre pump, speedometer and mileage recorder positively driven from the gear box, 12-volt five lamp bus lighting and starting set with dipping head lamps, stop signal lamp, fog lamp, electric horn, front shock absorbers, vacuum servo assisted brakes, air filter for carburetter, and full kit of tools. Body fitted with special bucket seats upholstered in furniture hide, drop windows in lower saloon, sliding windows in upper saloon, roof ventilators, destination indicator, enclosed staircase, etc.

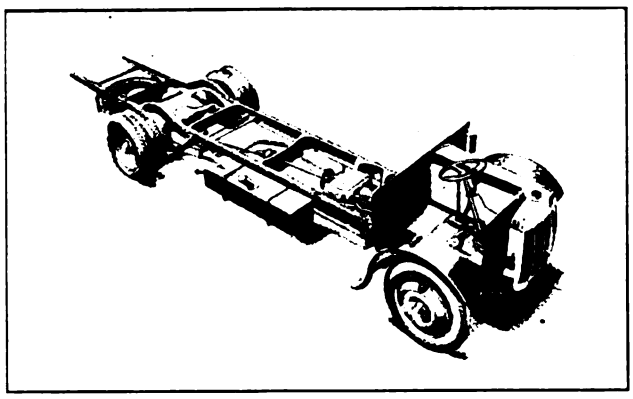
Tilling-Stevens Motors, Ltd., 5 Iddesleigh House, Caxton Street, Westminster, London, S.W.1. Stand No. 72. There will be four exhibits as follows:—(1) A type B.10.A.2. low load line "Express" chassis, shown as chassis only. It has forward steering, a 16 ft. wheelbase and Dunlop 36 in. by 6 in. tyres single front, twin rear. It is a gear driven chassis designed for 32-seater bodies. (2) A similar chassis to above fitted with Dunlop pneumatic tyres size 38 in. by 7 in. and equipped with 26/32-seater double purpose coach with sunshine roof. (3) A type B.10.B.2. low load line "Express" chassis, with normal steering, fitted with 38 in. by 7 in. Dunlop tyres, single front, twin rear. This chassis will be fitted with a 26-seater parlour coach by the Hoyal Body Corporation (1928), Ltd. (4) A petrol-electric type T.S.17.A. chassis which will be shown as chassis only. It has forward steering and a 16 ft. wheelbase. It has Dunlop pneumatic tyres 36 ft. by 8 in. single front, twin rear. It is designed for 52-seater passenger bodies. With regard to the engine of the "Express" gear driven chassis (exhibits Nos. 1, 2 and 3), it is of 29/70 h.p. Ricardo design, four cylinders, bore 4¼ in., stroke 5½ in. It has forced feed lubrication and high tension magneto. The engine of the petrol-electric chassis is 36/95 h.p., also a four cylinder model, bore 4¾ in., stroke 6 in.



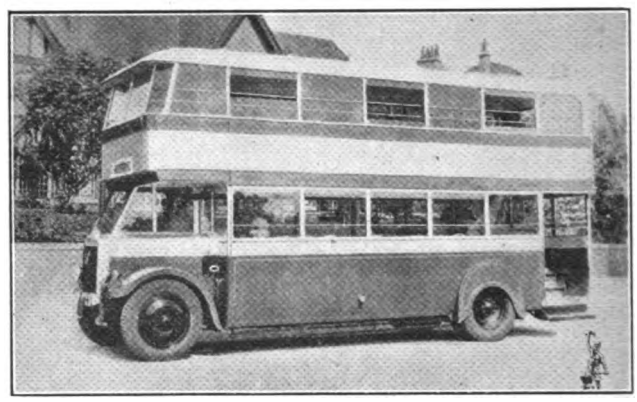
THE TILLING-STEVENS LOW LOAD LINE "EXPRESS" CHASSIS—FORWARD STEERING.

Trojan, Ltd., Purley Way, Croydon. Stand No. 84. There will be exhibited one 7 cwt. van, one 10 cwt. van and a six wheeler.

United Motors, Ltd., 27-34 Walnut Tree Walk, London, S.E.11. Stand No. 43. This firm are the sole concessionaires for Great Britain and Ireland for Federal chassis, six of which will be found on the stand as follows:—(1) A long de luxe bus chassis type A.6. with 26.2 h.p. six cylinder engine, price £1,375. (2) A long bus chassis type T.7.W. with a similar engine to above and of 3 tons capacity. Price £800. (3) A commercial short chassis, type T.3. with 24.7 h.p. four cylinder engine, 3-ton capacity. Price £895. (4) A commercial long chassis type T.3. also of 3 tons capacity, £730. (5) A commercial short chassis, type F.W., with an 18.6 h.p. four cylinder engine and 30 cwt. loading capacity, price £330 and finally, a commercial chassis, type F.7., with a 26.2 h.p. six cylinder engine and of 2 tons capacity, price £510.

Vincents of Reading, Station Square, Reading. Stand No. 66. This firm has specialised for many years in the construction of horse boxes. They will exhibit on their stand a three-horse box constructed to carry comfortably and safely three large hunters. One of the features of this box is its compactness, the overall length being only 16 in. more than the two horse box. Two horses are loaded exactly in the same way as with the two horse box and the third horse enters by a low loading ramp at the rear of the vehicle and leaves by the side. This box mounted on a Star chassis costs £1,125. The firm makes boxes to accommodate up to six horses.

Vulcan Motor and Engineering Co. (1906), Ltd., Crossens, Southport. Stand No. 40. A very comprehensive range of Vulcan vehicles will be staged. They will be as follows:—(1) A 30 cwt. mechanical end tipper fitted with a Vulcan four cylinder engine and four speed gear box. The tipping gear is by Edwards Bros., of Bolton. The price of the chassis with solid tyres is £310, with pneumatic tyres £335, complete with body £432 10s. (2) A 30 cwt. forward control chassis with similar engine and gear box to exhibit No. 1. The wheels will be shod with 32 in. by 6 in. British Goodrich tyres. The price of this chassis is £335 with solid tyres, or £350 with pneumatics. (3) A 50 cwt. forward control chassis with four cylinder Vulcan engine of 24.8 h.p. R.A.C. rating and a four speed gear box. The engine is of monobloc construction, has magneto ignition and detachable cylinder head. Chassis price with solid tyres £535, with pneumatic tyres £585. (4) A 35 cwt. "Shaftesbury" type low loader which is similar to the 30 cwt. forward control chassis above mentioned. (5) The "Duchess" 20-seater luxury sunshine saloon, the chassis of which is normally built for carrying 26 passengers. The engine is the Vulcan four cylinder model with a bore of 110 m.m. stroke 140 m.m. giving 30 h.p. R.A.C. rating. A six cylinder engine can be supplied with this model if desired. The gear box has four forward speeds and the brakes are Servo-assisted operated in drums on both front and rear wheels. The petrol tank is on the side of the chassis with Autovac feed to the carburetter. Chassis price £725, complete £1,200. (6) The "Prince" 32-seater omnibus with a Vulcan four cylinder monobloc engine, 30 h.p. R.A.C. rating. The chassis price is £1,050, price complete £1,500. (7) An "Emperor" 51-seater double-deck omnibus, this being one of the latest additions to the Vulcan range of passenger vehicles.



THE VULCAN "EMPEROR" 51-SEATER DOUBLE-DECKER BUS.

Warwick Motor Body Building Co., Warwick Works, White City, Old Trafford, Manchester. Stand No. 24. The exhibits will be as follows:—(1) A Latil chassis fitted with a de luxe 6-seater all-weather saloon coach body with Solcar drop-back hood, electrically operated. (2) An Austin six cylinder chassis with a 9-seater fabric de luxe all-weather saloon fitted with Solcar drop-back hood mechanically operated.

Waveney Company, Ltd., Stanley Road and Heath Road, Oulton Broad, Lowestoft. Stand No. 96. The Waveney bodies exhibited will include (1) A 14/16 saloon body mounted on a Chevrolet six cylinder chassis. (2) A 20-seater luxury coach on the G.M.C. T42 chassis. (3) A 24/26-seater Coupe-de-Ville long distance coach mounted on the A.J.S. forward drive chassis.

Weymann Motor Bodies (1925), Limited, Addlestone, Surrey. Stand No. 88. There will be a Weymann coach body mounted on the C.F.6 overtype Daimler chassis. The body is built in accordance with the well-known Weymann principle of flexible body construction, designed for 30 passengers and to conform to Scotland Yard regulations. Special attention has been given to the point of exterior line, the waist line being swept down in the front bulkhead. The shortened turn-under with running board and valances fitted along each side adding considerably to the general appearance. Two full coach type doors are fitted on the nearside and a door for driver's cab on the offside. Special apparatus for interior heating is fitted. Seats are of the arm-chair type with sprung head rolls, the backs being fitted with expanding Dorothy bags.

Etablissements Willeme, Nantorre (Seine), France, and c/o Automotive Spares, Ltd., 164a King's Road, Chelsea, S.W.3. Stand No. 101. (1) A 40 h.p. four cylinder "Liberty" 12-ton six-wheel chassis. Engine: Cylinders cast in pairs, detachable heads, bore 5 in. by 6 in. stroke (Treasury rating 40 h.p.), cooling by pump, dual ignition, electric lighting, multiple disc dry-plate clutch, 8-speed gear box, cardan shaft drive to worm and worm wheel final drive, internal expanding brakes on four rear wheels, Servo operated, chassis weight 6 tons, wheelbase 230 in., track 60 in.,

Digitized by Google

steel disc wheels, pneumatic tyres 42 in. by 9 in. single front, and 42 in. by 9 in. twin rear, front and rear bumpers, trailer attachment. (2) A 36 h.p. four cylinder "Liberty" 7-ton standard tipping lorry. Engine: cylinders cast in pairs, detachable heads, bore 4¾ in. by stroke 6 in. (Treasury rating 36.1 h.p.); dual ignition, electric lighting, 4-speed gear box, cardan shaft drive to worm and worm wheel final drive, internal expanding brakes on rear wheels, chassis weight 4½ tons, wheelbase 161 in., track 60 in., cast steel wheels; front tyres 36 in. by 5 in., rear 40 in. by 12 in., steel body fitted with Wood hydraulic tipping gear, front and rear bumpers, trailer attachment.

Willowbrook, Limited, Derby Road, Loughborough. Stand No. 64. A coach building exhibit—the following will be shown:—(1) A 32-seater saloon type corporation bus, mounted on C.F.6 type "Daimler" chassis. Semi-bucket seats in leather. Interior entirely French polished, garnish rails inlaid, roof French polished and fitted with burr walnut lamp panels. (2) A 20-seater sunsaloon parlour coach, mounted on an "A.J.S." Pilot chassis. Divan type seats upholstered in furniture moquette. Interior woodwork inlaid and French polished in two colours. In one minute the head of coach can be opended or closed by a single attendant without disturbing a single passenger, or even stopping the coach. (3) A 20-seater sunsaloon all-weather coach, mounted on a "Commer" 6 T.K. chassis. Upholstery carried out in three-colour furniture hide, no turn buttons, press studs or thumb screws, simple turning of the handle opens or closes the hood. (4) An 18-seater sunsaloon all-weather coach, mounted on a "Bean" 30-cwt. chassis. Fixed dome back and provision for carrying luggage.

Willys Overland Crossley, Ltd., Heaton Chapel, Stockport. Stand No. 75. The firm will exhibit "Manchester" 30/35-cwt. and two-ton vehicles, a Commerce saloon and 10-cwt. van models, and will introduce for the first time the Willys-Commercial six cylinder chassis, which will be fitted with a 15-seater coach body. The bore and stroke are 3⅛ in. by 3¾ in. respectively (Treasury rating 23.4 h.p.). Valves side by side, detachable turbulent cylinder head. The crankshaft is drilled for pressure lubrication, and the pistons are aluminium alloy with internal steel strut. The power developed is 50 b.h.p. A single dry-plate clutch transmits the drive to a centrally controlled four-speed gear box, and from thence through an open propeller shaft with two oil lubricated metal universal joints to a spiral bevel final drive. The chassis price is £220. The "Manchester" two-ton models are also new. In brief, the two-ton chassis has a four cylinder engine rated at 22.5 h.p. with detachable head and detachable cylinder block, a five bearing crankshaft and pressure lubrication automatically controlled *pro rata* to the throttle opening, side by side valves and cast iron pistons. The drive is through a single dry-plate clutch to a centrally controlled three speed gear box, and thence through an open propeller shaft to the spiral bevel final drive. The front tyres are 32 in. by 6 in. high pressure and the rear tyres are 34 in. by 7 in. high pressure mounted on single disc wheels with eight studs for quick removal. The "Manchester" 30/35 cwt. models follow the same engine and chassis lay-outs as the two-ton type, but have lighter springs, rear wheel brakes and detachable steel spoke wheels having 32 in. by 6 in. tyres front and rear. The Willys-Overland 10-cwt. van has a large capacity body, a four cylinder mono-bloc engine, 3⅛ in. bore by 4¾ in. stroke, claimed to develop 40 h.p. at its peak. The drive is taken through a single dry-plate clutch and thence through an open propeller shaft with two metal oil lubricated universal joints to the spiral bevel final drive. Engine and chassis details are the same as for the 10-cwt. van, but the chassis is fitted with a pleasing saloon body with one 36 in. door at each side, and a large concealed 42 in. door in the rear of the body.

W. Wilson & Son (Herts), Ltd., 70 Victoria Street, London, S.W.1. Stand No. 53. The Wilson-Garner motor horse box will be shown. This box has been built for use as a loose box if required or to carry two horses each in a separate stall. The horses have a clear standing space, there are no wheel arches or other obstacles in the floor of the stalls which is well drained and gives ample space. The paddings of the stalls are of leather and rubber, giving a smart appearance. Easily cleaned and more sanitary than canvas or cocoanut matting.

Wilson Motor & Engineering Co., 20 High Street, Kingston-on-Thames. Stand No. 124. The exhibits will consist of (1) a laundry body fitted on a Morris commercial 30 cwt. chassis and (2) a furniture carrying body mounted on a 3-ton "Y" type Morris commercial chassis.

Wilton Carriage Company, Limited, 470, London Road, Croydon. Stand No. 23. Upon a 30-cwt. Bean chassis there will be mounted an all-weather coach fitted with "Sun Saloon" head operated by a winding handle. Arm-chair seats covered with furniture hide, foot rests to each seat. Illuminated indicators front and rear. Inlaid mahogany cabinet work, drop windows, sunvizor to windscreen. On a Vulcan "Duchess" chassis will be a luxury parlour coach to carry 24/26 passengers. Streamline body with full dome back. Two doors on the near side and one for the driver. All side windows made to drop, fitted with Quicktho lifts. Armchair seats covered in figured moquette with down cushions. Foot rests to all seats. Blue pile carpet on floor. Nickel plated parcel racks. Blue curtains to windows. Interior roof and side panels covered with special fabric, blue shot with gold. Body heated by Metcalfe's patent system taken from radiator. Mahogany cabinet work suitably inlaid. Interior lit by eight large nickel plated flush lamps in roof.

Yorkshire Patent Steam Wagon Co., Hunslet, Leeds. Stand No. 56. The exhibit will consist of a W.J. rigid six wheel steam wagon with hydraulic three-way tipping gear and also a W.J. model chassis arranged so as to display all working parts. The principal features of the W.J. Yorkshire steam wagon are:—(a) A double ended locomotive type boiler with super-heaters in the smoke boxes. A vertical engine developing 6 b.h.p. A feature of the rear bogey carriage is that each axle is driven by an independent propeller shaft which is claimed to provide both accessibility and a reduction of angular movement in the universal joints to a minimum. The axles are worm driven and are automatically lubricated throughout. This vehicle is the first steam cardan shaft drive rigid six wheeler. Altogether the Yorkshire rigid six wheeler is a most interesting vehicle. It is very economical in fuel and will carry loads from 10 to 15 tons.

* * * * * *

Accessories, Components and Garage Equipment.

A. C. Sphinx Sparking Plug Co., Ltd., Bedford Street, Birmingham. Stand No. 321. Ranges of A.C. sparking plugs, A.C. oil filters, fuel pumps and air cleaners.

Acton Manufacturing Co., Strafford Road, Acton, London, W.3. Stand No. 213. As manufacturers of spares of all descriptions for all well-known types of lorries and specialising more particularly in Peerless lorry spares such as crown wheels, valves, valve guides, gudgeon pins, shackle bolts, pistons, steering ball pins, etc., the firm will be showing a comprehensive range.

Amalgamated Carburetters, Ltd., Holford Works, Perry Barr, Birmingham. Stand No. 346. "Amal" carburetters incorporating the "Economiser," petrol filters, "Flow-meters" and "Jet Calibrating Machines."

T. B. Andre & Co., Ltd., Victoria Gardens, Ladbroke Road, Notting Hill Gate, London, N.W.11. Stand No. 363. A special feature of this stand will be the "Silent-bloc" bearing which we noticed, when writing our advance reports on chassis to be exhibited, is adopted by many motor manufacturing firms.

Anglo-American Oil Co., Ltd., 36 Queen Anne's Gate, London, S.W.1. Stand No. 150. The firm will be exhibiting a range of G. & B. pump installations both for inside and outside, also a cheap commercial bulk storage outfit and a portable outfit, Pratts "High Test" and Pratts "Commercial" spirit. Special interest attaches to this year's exhibits owing to the introduction of two new lines—Pratts motor oil and Pratts High Test petrol. The motor oil is the result of years of research work on the part of the Company's chemists and technicians. For the "High Test" petrol two important claims are made, namely, remarkable power development and wonderful acceleration. It will also be remembered that the firm markets Pratts Ethyl spirit.

George Angus & Co., Ltd., Telamite Works, Bentham, near Lancaster. Stand No. 242. A range of Telamite brake linings, clutch leathers, spring pads, etc.

Anti-Attrition Metal Co., Ltd., 1, Victoria Street, Westminster, London, S.W.1. Stand No. 343. Patent anti-attrition bronzes and white bronze products, comprising:—Big end connecting rod bearings, crankshaft bearings, Gudgeon pin bushes, floating wheel hub bushes, worm wheel, water pump bodies, bushes and bearings for gear boxes, brake gear and all other wearing parts of motor chassis. Also chill cast solid and cored sticks, for the manufacture of small bushes, bearings, sleeves, etc.

Auster, Ltd., Crown Works, Bradford Street, Birmingham. Stand No. 302. A display of the latest type wind

Digitized by Google

shields, all-weather equipment, head fittings and general body fittings.

Auto-Klean Strainers, Ltd., 40 Trinity Square, London, E.C.3. Stand No. 194. "Auto-Klean" gauzeless self-cleaning petrol filter in three models. Large strainers for filling stations. Lubricating strainers for motor vehicles and special models for testing new engines. Special lubricating strainers as fitted to the engine crank cases of many of the outstanding vehicles in this Exhibition. Pedal operated Auto-Klean lubricating strainers, completely automatic. The Waste Oil Reclaimer, a money-saving device for garages, service stations, etc. Price from £5.

Automotive Products Company, 3 Berners Street, London, W.1. Stand No. 362. Timken axles, Borg and Beck clutches, Fuller gear boxes and clutches, Lockheed hydraulic brakes, Hannum steering gears, Oakes fans, Mather springs, Philbrin coil ignition, Cleveland graphite bronze bushings, Autoduct link-v-belting, Atwood adjustable door bumpers, and Purolater—the oil filter.

B.E.N. Patents, Ltd., 92 Tottenham Court Road, London, W.1. Stand No. 185. The exhibit will, of course, include the various well-known B.E.N. washers, and amongst the newer exhibits will be the B.E.N. mechanical flexible drive polishing machines for polishing cellulose lacquers; it is claimed that this machine cuts down the time taken for rubbing and polishing by at least 50 per cent. There will also be the B.E.N. dual air unit as a high pressure greaser. The unit is well known as a combination spray paint and tyre inflation unit and it may now be adapted for a further purpose, namely, that of greasing in conjunction with a Tecalemit high pressure greaser.

B. H. B. Self-Adjusting Pistons, The Green, Twickenham, Middlesex. Stand No. 231. B. H. B. self-adjusting pistons, Whatmough-Hewitt combustion heads, Autostats (air temperature regulator), ball end tappet adjusting screws, carburetter jets, and the "Seeger" retaining ring.

Barrett Tagant & Gotts, Ltd., Chase Street Works, Red Bank, Manchester. Stand No. 175. A range of oils and greases known as the "Maxima" brand.

E. P. Barrus, Ltd., 35, 36, 37 Upper Thames Street, London, E.C.4. Stand No. 245. Blackhawk hydraulic lifting jacks and socket wrenches, Van Norman valve refacers and reseaters, Stanley electric drills and grinders, decarbonizing tools, precision tools, Stanley Atha automotive tools, Cleveland drills and reamers, Porter bolt cutters and nut splitters, Disston files and saws, Bernard pliers, punches and wrenches and the Union steel tool chest.

Batteries, Ltd., Hunt End Works, Redditch. Stand No. 292. The subject of this exhibit will be the "Nife" nickel steel alkaline cadmium accumulators which, being constructed mainly of steel, will stand any amount of vibration.

G. Beaton & Son, Ltd., Beatonson Works, Victoria Road, Willesden, London, N.W.10. Stand No. 99. They will be exhibiting their "Plein Azur" sliding roof fitting which will also be seen on many of the coaches exhibited in the show; also there will be exhibited a new type of hinge known as the Beatonson patent D.F. ball-jointed steel hinge.

Beckett, Laycock & Watkinson, Ltd., Acton Lane, London, N.W.10. Stand No. 279. The principal exhibits will be the Beclawat sunk handle and horizontal sliding windows, type B.5. They will also show their circular revolving ash trays, silent window channel and various other small window fittings.

Bell Punch & Printing Co., Ltd., The Island, Uxbridge, Middlesex. Stand No. 201. Everything in connection with fare control systems, such as conductors bell punches, ticket racks, cash bags, etc.

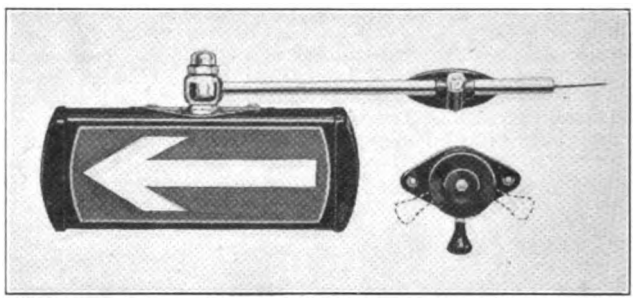
Bendix-Perrot Brakes, Ltd., Westwood Road, Witton, Birmingham. Stand No. 257. One of the most interesting exhibits will be the Bendix-Cowdrey dynamic brake tester. This measures the braking effect on each wheel of a motor vehicle, the reading being in terms of road pull. In its simplified form the brake tester consists of two, or more, pairs of grooved rollers driven by electric motors, one pair being placed under each wheel to be tested; these rollers, when rotated, drive the vehicle wheels and actually take the place of the road. By suitable reducing gear, together with weighing mechanism, a direct reading of "the pull of the road" at each wheel can be obtained, and the necessary brake adjustment can be scientifically made.

A. E. Bennett & Co., Bercy's Buildings, George Street, Liverpool. Stand No. 251. Photographs of fleets of buses and commercial vehicles lubricated with Viscol. Original carbon filter papers showing a minimum of carbon deposit with Viscol oils as compared with some other brands.

Benton & Stone, Ltd., Bracebridge Street, Birmingham. Stand No. 280. Prominent will be the Enots commercial vehicle jack, heavy type flexible and Autolub lubricating guns, cork seated petrol taps, filters, commercial type radiators and petrol filler caps.

J. Blakeborough & Sons, Ltd., Woodhouse Works, Brighouse, Yorks. Stand No. 268. A range of the firm's commercial fire extinguishers including the Nuswift type "C" machine suitable for commercial vehicles.

Bluemel Bros., Ltd., Wolston, near Coventry. Stand No. 340. Amongst a very wide range of useful accessories there will be neat direction indicators which can be controlled from the facia board and have no



BLUEMEL'S "WAYLITE" DIRECTION INDICATOR AND SWITCH.

mechanical moving parts; also there will be steering wheels, plates and the "Beamlight" rear lamp.

S. F. Bowser & Co., Inc., Windsor House, Victoria Street, London, S.W.1. Stand No. 154. The firm will be showing their new type of petrol dispensing unit which supersedes the old types of petrol pumps.

Bristol Pneumatic Tools, Ltd., Causeway Works, Fishponds, Bristol. Stand No. 248. The exhibit will include air compressors from the smallest 2¼ cub. ft. belt driven machine up to the very largest sizes required for garage purposes. There will also be the Bristol tyre pressure control for servicing tyres accurately from either air storage tanks or direct from small compressors.

British Belting and Asbestos, Ltd., 59 Southwark Street, London, S.E.1. Stand No. 229. "Halo" brake shoe linings and clutch disc rings. "Mintex" brake shoe linings and clutch disc rings. "Scandinavia" patent bevel woven selvedged clutch liners. "Scandinavia" bonnet and radiator dampers. "Scandinavia" endless woven fan belts. "Scandinavia" textile straps and Ford specialities.

British Bock Bearings, Ltd., 120 Cornwall Street, Glasgow. Stand No. 352. The exhibit will consist of the Bock taper roller bearing and the components thereof.

British Piston Ring Co., Ltd., Holbrook Lane, Coventry. Stand No. 225. Brico piston rings and Scraypoil rings, stepped and slotted types, Rotokast cylinder liners all made from centrifugal castings in the firm's own foundry, also shackle bolts and gudgeon pins, valve guides and valve tappets.

British Thomson-Houston Co., Ltd., Rugby. Stand No. 335. Not only will there be a number of magnetos designed for commercial vehicles but combined magneto-coil ignition sets, impulse starters, automatic ignition timing devices, flexible magneto couplings with infinitely variable adjustment, Fabroil silent timing gears and Mazda automobile electric bulbs. The magnetos are of the rotating armature, rotating magnet and polar inductor types and there is to be shown for the first time the B.T.H. type HE magneto, particularly suitable for use with large commercial engines.

British Timken, Ltd., Cheston Road, Aston, Birmingham. Stand No. 188. A representative range of Timken tapered roller bearings, a Leyland commercial hub section showing the application of Timken bearings to the worm shaft.

J. Brockhouse & Co., Ltd., Victoria Works, Hill Top, West Bromwich. Stand No. 181. Laminated springs and spring fittings, cast and pressed steel wheels, axles—ball, and roller bearing, and phosphor-bronze floating bushes for motor trailers; stampings, forgings, windscreens, etc.

David Brown & Sons (Huddersfield), Ltd., Park Works, Lockwood, Huddersfield. Stand No. 287. The firm's well-known patent worm gearing, centrifugally cast worm wheel bronze, "No. 4" standard gear box, Amherst

Digitized by Google

Villiers "DBS" superchargers, hobs, cutters, calipers, patent reamers, spiral bevel gears, differential bevel gear and worm steering gears.

Brown Bros., Ltd., Brown's Buildings, Great Eastern Street, London, E.C.2. Stand No. 295. The firm will be showing accessories and spares of every description, also car washers and car cleaners.

R. Cadisch & Sons, 5 and 6 Red Lion Square, London, W.C.1. Stand No. 161. A complete exhibit of all the firm's latest items of garage equipment and labour saving tools, amongst which will be the B.E.N. dual air unit, Black and Decker range of electric tools, Tecalemit lubricating devices, tanks, etc., The Ekco air station, Laycock hydraulic car washer, L.S.D. pressure cleansing tanks and a complete range of commercial mirrors, horns and odometers.

Car and General Insurance Corporation, Limited, 83 Pall Mall, London, S.W.1. Stand No. 12. Prospectuses, etc., in respect to insurance of all types of commercial vehicles.

Carless, Capel and Leonard, Hope Chemical Works, Hackney Wick, E.9. Stand No. 240. The special feature of this stand will be petrol pumps and a lubricating oil cabinet.

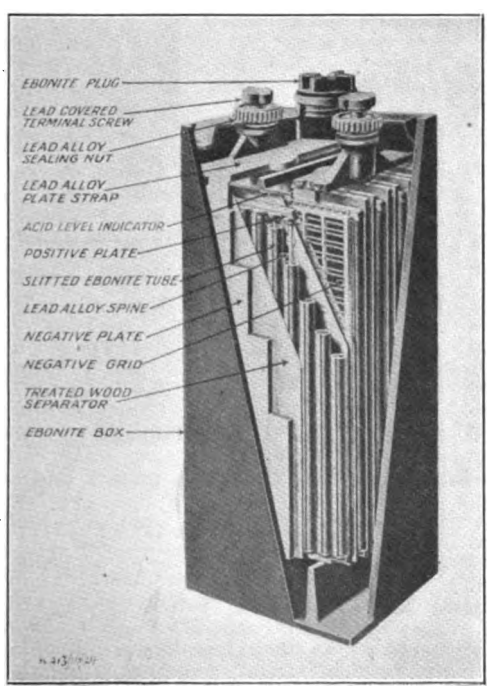
William E. Cary, Ltd., Red Bank & Adeline Street, Manchester. Stand No. 207. Cary laminated springs, spring eyes, Cary bumpers, pressed steel disc wheels, trailer axles with floating bushes, ball and roller bearings, a horse box trailer set and various trailer fittings and stampings, also motor body fittings, and tipping gears.

Caxton Name Plate Manufacturing Co., 11, 13 and 15 Rochester Row, Westminster, London, S.W.1. Stand No. 8. Name plates engraved or cast in various metals and in Ivorine; enamelled badges, skeleton plates for radiators, letters and numbers, etc.

Challenge Oil Co., Ltd., Howard Works, Stoke Newington, N.16. Stand No. 318. Challenge and Super-Challenge motor oils and greases.

Champion Sparking Plug Co., Ltd., 83 Pall Mall, London, S.W.1. Stand No. 174. The subject of the exhibit will be the Champion type 8 C.V. plug designed for heavy duty transport work.

A. W. Chapman, Ltd., Ranelagh Gardens, Hurlingham, London, S.W.6. Stand No. 222. The "Thermorad" car heater and footwarmers. The "Nevajam" shock absorber, load adjuster and spring saver, designed to prevent swaying of high bodies vans and takes extra load. The "Louvre" step mat and "Leveroll" sliding seat mechanism.



EXIDE-IRONCLAD BATTERY. CELL CUT AWAY TO SHOW CONSTRUCTION.

Chloride Electrical Storage Co., Ltd., Clifton Junction, near Manchester. Stand No. 200. Exide batteries for starting and lighting commercial motor vehicles of all kinds, also Exide-Ironclad batteries for heavy duties on petrol driven vehicles such as starting and lighting heavy commercial motors, buses and coaches. Exide-Ironclad batteries for propelling electric vehicles.

Charles Churchill & Co., Ltd., 9-15 Leonard Street, Finsbury, London, E.C.2. Stand No. 177. The exhibit will include garage equipment, air compressors, tyre inflators, etc.

William Clark, 11½ Great Dover Street, Borough, S.E.1. Stand No. 182. A comprehensive range of parts and accessories.

Clayton Dewandre Co., Ltd., Titanic Works, Lincoln. Stand No. 187. Specimens of the Dewandre vacuum servo brake mechanism now in almost universal use on heavy vehicles. There will be demonstrated a large unit employed on heavy vehicles. A light type also will be shown for use on light chassis. The Rubury-Alford and Alder front wheel brake will be exhibited as a complete assembly for a bus. The Clayton-Still wire wound tube for radiator construction will also be shown.

Clews Petersen Piston Ring & Engineering Co., Ltd., West Heath Works, Mill Lane, West Hampstead, London, N.W.6. Stand No. 347. A large range of the "Clupet" piston rings will be shown.

Robert W. Coan, Ltd., Coan House, Duncan Street, Islington, N.1. Stand No. 349. Aluminium castings of all descriptions used in motor chassis and body construction.

Cocker Bros., Ltd., Fitzalan Works, Sheffield. Stand No. 344. Specialising in spring manufacture, this firm will exhibit a comprehensive range of laminated and other springs and spring fittings.

Commercial Motor Users' Association (Incorporated), 50 Pall Mall, London, S.W.1. Stand No. 105. Officials of the Association will be in attendance to answer enquiries and to enrol commercial motor users as members.

Connolly Bros. (Curriers), Limited, Charlton Street, Euston Road, London, N.W.1. Stand No. 305. The exhibit will consist of real leather hides, treated in various ways and suitable for all upholstery and other purposes in connection with motor body construction.

Cooper-Stewart Engineering Co., Ltd., Stewart House, 136/137 Long Acre, London, W.C.2. Stand No. 323. There will be a complete range of the Stewart speedometers, revolution indicators, hubodometers, tachometers, also the Stewart model M.3 speedometer with sealed head, specially designed for heavy lorries. The exhibit will also include bulb horns, observation mirrors, direction indicators, etc.

Cooper, Webb-Jones & Co., Stockwell Works, Walsall, Staffs. Stand No. 339. The "Sidno" patent all-weather hood fittings for passenger vehicles will be shown.

Cooper's Mechanical Joints, Limited, 81½ Lower Kettering Lane, London, S.E.11. Stand No. 224. Copper and asbestos gaskets, compressed asbestos jointings, laminated cork joints, trimming panels, rubber insertion joints, various washers, etc.

Coventry Chain Company, Limited, Spon End Works, Coventry. Stand No. 334. The Company will exhibit:—(1) A six cylinder engine sectioned to show the application of a Duplex roller chain to the driving of an overhead camshaft and auxiliaries. An automatic tensioner is fitted to the drive for the purpose of maintaining the chain in correct adjustment. The use of this accessory permits adjustment to be made without moving the auxiliary shaft. (2) Automatic tensioners as fitted to prominent commercial vehicles will also be exhibited. (3) Samples of single, duplex and triplex roller chains and of inverted tooth chains used for camshaft driving. (4) Samples of single and duplex heavy roller chains used for the final drive of commercial vehicles.

Coventry Climax Engines, Ltd., Friars Road, Coventry. Stand No. 255. A range of the Coventry Climax engines of from 5 h.p. up to 36 h.p.

Coventry Radiator & Presswork Co., Ltd., Raglan Works, Lower Ford Street, Coventry. Stand No. 284. commercial vehicle radiators of all kinds for well-known commercial vehicle manufacturers. The speciality will be the Clayton-Still type radiator.

Cox & Co., 135 Lower Richmond Road, Putney, S.W.15. Stand No. 217. The principal exhibit is to be windscreens and the adaption of the firm's patent movement to the commercial motor screens, the features of which are (1) rigid lock; (2) watertight and (3) simplicity. Louvre ventilators, tilt covers and luggage trunks and carriers will also be on view.

Cresswell's Asbestos Co., Ltd., Wellington Mills, Bradford. Stand No. 160. Chekko pure asbestos brake and clutch linings and materials from which Chekko is manufactured, fibre in crude state and Chekko in the making, also in sheets and rollers, etc.

Digitized by Google

Culverhouse & Sons, 72/76 Newington Causeway, S.E.1. Stand No. 17. All bus and coach fittings, including inside linings, leather, lorry iron work, screens, etc.

D.P. Battery Company, Ltd., Bakewell, Derbyshire. Stand No. 282. Various types of Kathanode batteries including bus lighting batteries, traction cells and component parts.

D.P. KATHANODE BATTERY.

Thomas De La Rue & Co., Ltd., 90, Shernhall Street, Walthamstow, London, E.17. Stand No. 210. A complete range of lighting and starter battery containers in the firm's acid proof moulding material known as "Telenduron."

Delco-Remy and Hyatt, Ltd, 111 Grosvenor Road, London, S.W.1. Stand No. 186. A comprehensive range of garage equipment including the "Roll-a-Car" Walker jacks, Bink's paint spray equipment, air compressors, brake testers, shock absorbers, etc.

W. B. Dick & Co., Ltd., 26 Grosvenor Gardens, London, S.W.1. Stand No. 152. Samples of the firm's well-known "ILO" brand oils will be shown

Docker Brothers, Rotten Park Street, Ladywood, Birmingham. Stand No. 3. Panels showing as finished products the firm's paints, enamels and varnish, together with their "Induroleum" flooring.

Dominion Motor Spirit Co., Ltd., 34, Bishopsgate, London, E.C.2. Stand No. 275. Acme and Dominion motor spirit, petrol pumps, models of road, rail and barge tanks.

W. H. Dorman & Co., Ltd., Stafford. Stand No. 342. A range of the popular Dorman engine as follows:—A 100 h.p. 6-cyl. type 6RH; a 72 h.p. 4-cyl. type 4RH; a 50 h.p. 6-cyl. type 6JUL; a 45 h.p. 4-cyl. type 4JORX; a 35 h.p. 4-cyl. type 4RU; a 30 h.p. 4-cyl. type 4JUD; a 30 h.p. 4-cyl. type 4JUS; an 18 h.p. 4-cyl. type 4MRA, and also a Dorman gear box, etc.

Dover, Limited, Northampton. Stand No. 272. The exhibit will consist of the well-known "Doverite" non-inflammable material and examples of its application as a covering to a variety of body and chassis fittings, particularly steering wheels.

Alexander Duckham & Co., Ltd., 6 Broad Street Place, London, E.C.2. A range of special commercial motor oils, also a demonstration showing the fluidity of the firm's "Adcol" oil at low temperatures.

Edmunds, Walker & Co., Ltd., 6 Newman Street, Oxford Street, London, W.1. Hoffman, Ransome and Marles and Timkin ball and roller bearings.

Englebert & Co., 119 and 125 Finsbury Pavement, London, E.C.2. Stand No. 164. "Lubol" motor oils and greases.

Equipment and Engineering Co., Ltd., 2 and 3, Norfolk Street, Strand, London, W.C.2. Stand No. 218. A comprehensive range of garage equipment.

F. H. Eve, Ltd., Old Bedford Road, Luton. Stand No. 196. Various models of the "Empire" engine stand will be shown.

Ewarts, Ltd., Dudley. Stand No. 176. Hot brass stampings, bonnet fasteners, petrol taps and wheel nuts.

Ferodo, Limited, Sovereign Mills, Chapel-en-le-Frith, via Stockport. Stand No. 338. Ferodo bonded asbestos brake lining. The standard woven material supplied in a large variety of widths and thicknesses, in rolls and strips. Ferodo bonded asbestos brake lining in sheet form from which brake linings may be cut to any required width and length, when a particular size is not immediately available in the standard roll material. Ferodo bonded asbestos die-pressed brake linings—a highly compressed material produced to close limits of size in any reasonable width, length, thickness, and radius, supplied from stock for well-known makes of cars. Boxed sets of die-pressed linings ready drilled and complete with necessary rivets, for Morris commercial vehicles.

FERODO PUBLICITY.

Ferobestos brake linings, particularly suitable for working against low carbon steel drums. Ferodo bonded asbestos die-made discs, for plate clutches, in a large variety of sizes, from 4 in. to 21 in. external diameter. and in thicknesses $\frac{1}{8}$ in. to $\frac{5}{16}$ in. Ferobestos clutch discs are produced from the same quality of material as Ferobestos brake linings and have the same physical characteristics. Ferodo fibre linings for cone clutches — a solid woven cotton fabric supplied formed to correct angle and dimensions ready for fitting to cone. Ferodo Bonrest—a strong tough material for bonnet linings. Prevents rattle. Practically unwearable and unaffected by heat.

Fisher & Ludlow (1920), Ltd., Albion Works, Rea Street, Birmingham. Stand No. 157. Axle cases, brake components and body fittings generally. Also such components as hub caps, cylinder head covers, petrol tanks, wings, wing stays, etc.

W. T. Flather, Ltd., Standard Steel Works, Sheffield. Stand No. 333. "Ubas" steels used in the construction of motor vehicles. There will be specimens showing the properties of this steel in the case hardened condition. It will be shown as gearing, worm shafting, pins, camshafts, etc. There will also be Keystone and alloy steels and various other brands of steel in the rough and manufactured.

Flexible Lamps, Ltd., 59 New Oxford Street, London, W.C.1. Stand No. 316. The exhibit will consist of the "Rubbolite" stop and rear lamps. As they are made of rubber they are unbreakable, nor can they be damaged by collision. The broken glasses can be instantly replaced. An extra set of glasses is supplied with each lamp. A range of these lamps will be shown.

Gallay Radiator Co., Ltd., 103/105 Scrubbs Lane, Willesden, London, N.W.10. Stand No. 269. Radiators of various well-known vehicles such as Guy, Citroen, Brockway, Low Loaders, Easy Loaders, Vickers Transport and other examples. The Gallay Thermostat shutter control.

Glico Petroleum, Ltd., Alexandra House, Queen Square, London, W.C.1. Stand No. 331. Packages for containing Carburine and Glico motor spirit, Glico Benzole mixture, "Decco Turps" and models of pump installations for both spirit and lubricating oil.

J. Gliksten & Son, Ltd., Carpenters Road, Stratford, London, E.15. Stand No. 58. Hardwoods for motor body construction generally.

Godins, Aldine Place, 142 Uxbridge Road, Shepherd's Bush, London, W.12. Stand No. 314. Windscreens, Louvre ventilators, rug rails and slamlocks.

Fredk. J. Gordon & Co., Ltd., 92 Charlotte Street, London, W.1. Stand No. 208. The Hobart range of garage equipment including battery chargers, test benches, air compressors, various garage tools, gauges and other instruments.

Greenwich Leathercloth Co., Ltd., 40 Shaftesbury Avenue, London, W.1. Stand No. 327. "Durex" leathercloth for exterior body covering and for interior upholstery.

Hadfields, Ltd., East Hecla Works, Sheffield. Stand No. 203. The firm will be showing examples of the wide range of steels which they manufacture for the motor industry including the "Hecla" and "Era" brands. There will also be a display of laminated motor vehicle springs.

Hall & Hall, 47 Leadenhall Street, London, E.C.3. Stand No. 267. "Hallite" motor jointing also washers and gaskets, special moulded packings in sets for commercial vehicles, copper and asbestos cylinder head gaskets and various other packing suitable for cars, also "Phiberoid" jointing material, "Halls" corkinsert, gear felt and felt washers.

Digitized by Google

Hall & Pickles, Ltd., Port Street, Manchester. Stand No. 159. High-speed tool steels, crucible cast and alloy steels and various other quality steels will be shown.

Hallam, Sleigh & Cheston, Widney Works, St. Paul's Square, Birmingham. Stand No. 268. "Widney-Stuart" and "Widney" coach fittings and furniture, such as drop window mechanism, parcel racks, ash trays, lamps, grab handles, etc.

Handford Greatrex & Co., Ltd., Walsall. Stand No. 270. Motor hides for upholstery, finished in any colour and various grains.

Andrew Handyside & Co., Ltd., Britannia Iron Works, Derby. Stand No. 221. Cylinder, cylinder heads, pistons and other engine parts in grey iron alloy, also chassis parts such as brake drums in "Whiteheart" malleable cast iron.

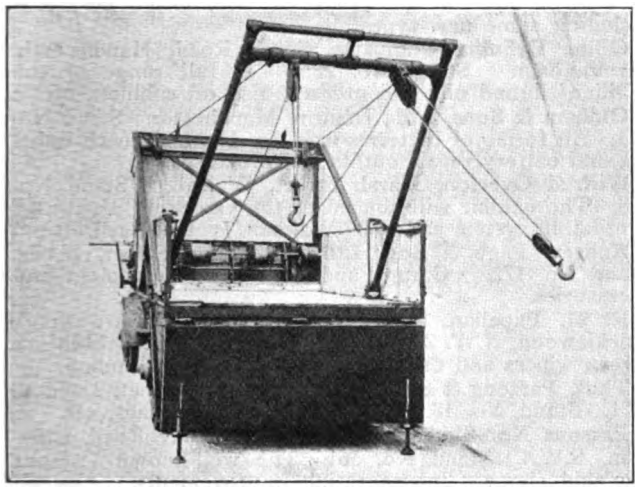
Harcourt Engineering Co., Ltd., Works Road, Letchworth, Herts. Stand No. 226. A large number of pistons finished, machined, in sand-cast and die-cast aluminium alloys and in cast iron.

Hardoll, Ltd., Queen's Park Works, 111 Salusbury Road, Kilburn, London, N.W.6. Stand No. 190. There will be a comprehensive range of petrol measuring and distributing pumps of the automatic and visible types.

Hardy Spicer & Co., Ltd., Birch Road, Witton, Birmingham. Stand No. 297, Main Gallery. Propeller shafts and universal joints, flexible couplings, oil-less bearings and self-lubricating bearings, will comprise the chief items of this exhibit.

John T. Hart & Sons, Wright's Buildings, Grange Road, Bermondsey, London, S.E.1. Stand No. 11. Coloured upholstery leathers and hides finished with a preparation of cellulose also enamelled hides for hoods.

Harvey Frost & Co., Ltd., 148-150 Great Portland Street, London, W.1. Stand No. 227. A selection of



THE H.F. DUAL SALVAGE CRANE.

new and standard HF equipment representing the HF range of vehicle maintenance, servicing and re-conditioning appliances. (1) HF Hydroforce vehicle washing plant for from 2 to 6 guns capacity, incorporating the Triplex pump. Delivers water at 300 lbs. per sq. in. pressure at infinite variation between a forceful cutting jet to a finely atomized spray. (2) HF standard brake tester for determining brake efficiency standards of individual vehicles and registering actual developed brake power. (3) Breakdown equipment such as HF dual crane for breakdown or loading, HF salvage cranes (heavy and medium duty) towing ambulances and towing poles. The dual crane leaves the floor of the breakdown lorry clear so that it can be used for any purpose other than breakdown work. (4) The complete range of tyre servicing appliances for which this firm is so well-known includes HF vulcanizing plants, re-treading moulds, tyre changers, rim wrenches, wheel pullers, tyre spreaders for facilitating the inspection and repair of giant and other covers, and spreaders are supplied for either hand or pneumatic operation. (5) An improved water-cooled air compressor plant with electric drive and automatic cut-out is one of the new models shown. There is a complete range of air compressors of the best type specially designed for garage and workshop use. General equipment includes high pressure greasing apparatus, floor cranes, garage presses, valve grinders, piston aligners, frame straighteners, "Hutto" and "Sunnen" cylinder grinders, paint sprays, portable electric drills, sanders, etc. There is also a fine selection of lifting devices, including high lifting jacks, lorry jacks and trolley jacks.

O. C. Hawkes, Ltd., Globe Works, Bromsgrove Street, Birmingham. Stand No. 21a. The firm's safety glass will be shown in various forms and in various finishes.

Thos. P. Headland, Pearman Street, Westminster Bridge Road, London, S.E.1. Stand No. 232. Garage equipment and general accessories, tools, anti-skidding devices and shock absorbers.

Hemming Bros., 233 Highgate Road, Sparkbrook, Birmingham. Stand No. 239. The exhibits will be as follows:—(1) A mechanically operated head fitting for all-weather motor coaches. (2) A hand operated head fitting.(3) An all-metal all-weather coach equipment and (4) all-weather coach fittings generally.

Hermetic Rubber Co., Ltd., "Hermetic" Works, Ryland Street, Birmingham. Stand No. 184. Patent flexible fabric coupling discs for driving and transmission shafts and couplings fitted with ferruled face plates to regulate compression and alignment. Horn bulbs, garage hose, tubing, rubber bushes and rings, tyre liners, foot pumps and pressure gauges.

G. N. Higgs, "Chromaloid Works," Oaklands Road, Cricklewood, London, N.W.2. Stand No. 247. Various samples of commercial vehicle parts treated with Chromaloid being a new process of Chromium plating.

Hills (Patents), Ltd., 33-34 Great Pulteney Street, Piccadilly, London, W.1. Stand No. 253. Number plates in solid, cast and polished aluminium.

H. M. Hobson, Ltd., 47-55 Acton Vale, London, W.3. Stand No. 296. A range of Claudel-Hobson carburetters and the Hobson K.S. Telegage which records the amount of petrol in the tanks in gallons. The Hobson "Perfect" window regulators, sparking plugs and a patent locking device for the prevention of theft of spare wheels, etc.

Hoffmann Manufacturing Co., Ltd., Chelmsford. Stand No. 294. A complete range of the well-known Hoffmann ball and roller bearings, also Hoffmann balls and rollers, suitable for all motor engineering purposes.

John Holroyd & Co., Ltd., Milnrow, near Rochdale. Stand No. 230. An interesting display of gears and parts for the commercial motor industry.

Homo, Ltd., 134 High Road, New Southgate, London, N.11. Stand No. 211. Number plates and sign plates of all descriptions in the firm's own brand of aluminium. Also aluminium step mats, tail lamps, etc.

Hope Hartope & Co., 43 Gower Street, London, W.C.1. Stand No. 289. Samples of the different lubricating oils this firm supplies.

Frank How & Co., Ltd., Trogon Wharf, 77-87 High Street, Stratford, London, E.15. Stand No. 148. A range of up-to-date equipment the firm supplies to those customers contracting for Trogon oils taken over a period. Also samples of Trogon aviation oils for long distance coach lubrication.

Hoyt Metal Company of Great Britain, Ltd., Deodar Road, Putney, London, S.W.15. Stand No. 291. The range of the firm's I.C.E. anti-friction metals shown as bearings and in sample bars.

Humfrey-Sandberg (Sales), Ltd., Transport House, Smith Square, London, S.W.1. Stand No. 212. The Humfrey-Sandberg free-wheel clutch will be shown in various sizes.

A. A. James, Ltd., St. George's Works, West Bromwich. Stand No. 178. The exhibits will consist of spring work, wire work and general iron work for the motor trade.

W. G. James, Ltd., 14 Mortimer Street, Regent Street, London, W.1. Stand No. 345. The firm specialise solely on the manufacture of valves for engines and will exhibit a range of specimens, produced by the Crypto patent process.

George Johnston, Ltd., 173, 175, 177 Shaftesbury Avenue, London, W.C.2. Stand No. 59. Leather and upholstery fabrics, electric lights, bent timber and air extractors.

A. A. Jones & Shipman, Ltd., East Park Road, Leicester. Stand No. 170. This firm will be exhibiting their usual range of reseating tools, also jacks, spanners, T. & J. reamers, 12 in. by 6 in. garage grinders, small drilling and grinding machines, electric drills, small tools, vices, etc.

C. L. Jones, 18-26 Church Street, Islington, London, N. Stand No. 263. There will be exhibited examples of repairs by electric arc and oxy-acetylene welding methods and a comprehensive selection of repaired cylinders, gear boxes, crankcases, crankshafts and axles, etc.

Digitized by Google

K.L.G. Sparking Plugs, Ltd., Robinhood Engineering Works, Putney Vale, London, S.W.15. Stand No. 313. A complete range of K.L.G. sparking plugs, specially designed for commercial vehicle engines, including the K.L.G. model 576 heavy duty plug.

Kirkstall Forge, Ltd., near Leeds. Stand No. 332. A complete bogie for a six wheeler 10/12-ton vehicle, a front wheel brake axle complete for a 32-seater chassis, one rear axle complete with gears and brake gear for a similar chassis, a front axle with hubs for a 2½-ton goods vehicle and a rear axle complete with gears and brake gear for the same.

Lake & Elliot, Ltd., Albion Works, Braintree, Essex. Stand No. 306. A complete range of jacks for commercial vehicles both mechanical and hydraulic. A range of garage equipment, a range of motor tools, consisting of brazing lamps, tool grinders, breast drills and valve reseaters, and a collapsible jacking ramp.

Lamplugh Spring Seats, Ltd., New Oxford House, Hart Street, London, W.C.1. Stand No. 252. Models of spring seats for public service vehicles will be the subject of this exhibit.

Laystall Motor Engineering Works, Ltd., Ewer Street, Southwark, London, S.E.1. Stand No. 266. Examples of the Laystall productions and special motor repairs, including new crankshafts and crankshafts re-ground and new camshafts and camshafts re-ground, cylinder grinding and oversize pistons, lightweight cast iron pistons. The Laystall process for scored cylinder repairs, welding of cylinders, crankcases and other parts and scientific engine overhauling.

Light Production Co., Ltd., 60/66 Rochester Row, Westminster, London, S.W.1. Stand No. 241. "Cygnet" piston rings, scraper rings, gudgeon pins, shackle bolts and the new Aerolite Mark IV compensating piston.

C. Lindley & Co., Ltd., 34 Englefield Road, London, N.1. Stand No. 158. Bright bolts, nuts, screws, wheel studs, etc., also machine tools such as lathes, drilling and milling machines and engineers' small tools and garage equipment.

Liquid Measurements, Ltd., Hammond Works, Victoria Road, North Acton, London, N.W.10. Stand No. 139. Various models of the Hammond outside and inside visible petrol pumps will be shown and lubricating oil storage equipments and tank cleaner apparatus.

Lodge Plugs, Ltd., Rugby. Stand No. 301. There will be a complete range of well-known Lodge plugs suitable for all classes of commercial motor works. The Lodge CV plug will be shown together with a new long reach model CVL, 1 in. reach.

London Lubricants, Ltd., Old Ford, London, E.3. Stand No. 168. "Trippel" motor oils and greases, "Extel" motor oils and greases, "Sivkel" motor oils and steam wagon and tractor lubricants.

Joseph Lucas, Ltd., Great King Street, Birmingham. Stand No. 303. There will be a full range of "King of the Road" accessories for commercial vehicles, including, of course, the well-known Lucas lamps, windscreen wipers, direction indicators, horns, observation mirrors, jacks, wrenches, oilers, lighting and starting sets, dynamos and general electric equipment, etc.

Lynton Wheel and Tyre Co., Ltd., Warrington, Lancashire. Stand No. 373. The subject of the exhibit will be detachable rims for commercial vehicles fitted to cast steel wheel centres, a system claimed to be an advantage as compared with detachable wheels particularly for use with passenger carrying vehicles.

M. C. L. & Repetition, Ltd., Pool Lane, Langley, Birmingham. Stand No. 153. This firm will have a running set including their 6½ in. dynamo with an output of 35/40 amperes at 12 V. suitable for double-deck buses. Other items will be non-dazzle head lamps and full equipments suitable for all commercial vehicle buses and taxicabs.

M.L. Magneto Synd., Ltd., Victoria Works, Coventry. Stand No. 298. A range of M.L. revolving field magnetos and a complete range of coil ignition units.

Mann Egerton & Co., Ltd., 5 Prince of Wales Road, Norwich. Stand No. 358. The exhibit will consist of tools and general garage equipment.

Matthew Wells & Co., Ltd., Wellsaline Oil Works, Manchester. Stand No. 234. The complete range of "Matwells" motor oils will be shown and the special trial offer of a 40-gallon barrel at £5 will be made.

J. & H. McLaren, Ltd., Midland Engine Works, Leeds. Stand No. 215. A 4-cyl. 60 b.h.p. Diesel engine, type MDB4, which has a speed of 800 r.p.m.; also a type L4 4-cyl. Diesel engine which has a speed of 1,200 r.p.m. and is capable of developing 40 b.h.p.

Miller Bros. (Brighouse), Ltd., Clifton Road, Brighouse, Yorks. Stand No. 319. "Pistoneze" motor oil in one grade only will be demonstrated by means of pistons moving in glass cylinders surrounded by ice to show that the oil is suitable for both winter and summer use. The Miller Anti-Dazzle light control will also be shown.

Morgan, Crossley & Co., Ltd., Miles Platting, Manchester. Stand No. 249. The subject of the exhibit will be the "Tenoid" brand of asbestos lining for use in motor vehicle construction.

Moss Gear Co., Ltd., Tyburn, Birmingham. Stand No. 191. Complete rear axles, worm drive differentials, steering gears, gear boxes and miscellaneous gear units.

National Benzole Co., Ltd., Wellington House, Buckingham Gate, London, S.W.1. Stand No. 258. Samples and packages in connection with the production and distribution of the three products—National Benzole Mixture, National Benzole, and N.B.C. lubricating oil.

National Plywood Corporation, Ltd., Mill Lane, Carpenters Road, Stratford, London, E.15. Stand No. 191. Plywood boards for motor body work.

National Steel Foundry (1914), Ltd., Leven, Fife. Stand No. 329. A comprehensive range of steel castings as used in motor chassis construction.

Newton & Bennett, Ltd., King Street, West, Manchester. Stand No. 290. Hydro-pneumatic shock absorbers and a complete range of brackets, fittings, etc.

R. D. Nicol & Co., Ltd., Prudential Buildings, Sheffield. A complete range of the "Dragonfly" brand of oils, greases and oil storage.

Nobel Chemical Finisher, Ltd., Slough, Bucks. Stand No. 146. "Belco" colour finish will be shown on wood and metal panels. Also suggested colour schemes for buses and vans.

North & Sons, Ltd., Whippendell Road, Watford. Stand No. 328. A full range of "Watford" magnetos including some new types.

Oiline Refining Company, South Road, Handsworth, Birmingham. Stand No. 286. A full range of the "Oiline" brand oils and greases, also oil cabinets, etc.

Oldham & Sons, Ltd., Denton, Manchester. Stand No. 163. All forms of batteries used for bus and coach lighting and battery repair outfits and processes.

Wilfred Overton, Marsh Street, Walsall. Stand No. 308. The exhibit will consist of the Overton "Perfecta" ventilating system and the "Walman" patent head fitting.

Andrew Page & Son, Ltd., 99 Albion Street, Leeds. Stand No. 172. Garage and breakdown equipment and accessories.

R. M. Papelian, Ltd., Trico House, Edgware Road, Cricklewood, N.W. 2. Stand No. 167. Trico and Folberth screen wipers and the Autopulse magnetic fuel pump.

Thos. Parsons & Sons, 315/317 Oxford Street, London, W.1. Stand No. 18. Parsons' paints, varnishes, etc.

Parsons Non-Skid Co., Ltd., 35 Macaulay Road, Clapham, S.W.4. Stand No. 361. The well-known Parsons non-skid changes incorporating improvements.

John Perks & Son, Lye, Stourbridge. Stand No. 283. Drop stamp forging wrought ironwork, tools, springs, bumpers and tipping gears.

G. D. Peters & Co., Ltd., Caxton House, Westminster, S.W.1. Stand No. 151. Vacuum brake and door operating apparatus and various coach equipment.

Phosphor Bronze Co., Ltd., 87/91, Sumner Street, London, S.E.1. Stand No. 155. "Cog Wheel" brand phosphor bronze and gun metal ingots and "Vulcan" brand white anti-friction metals.

Pickavant & Co., Ltd., Granville Street, Birmingham. Stand No. 348. The "Apkoway" line of garage tools, "Weather shields" line of all-weather equipment for coaches and coach fittings, etc.

Prices Patent Candle Co., Ltd., Battersea, S.W.11. Stand No. 278. The well-known range of motorine compound lubricants.

Pyrene Company, Ltd., Grosvenor Gardens, London, S.W.1. Stand No. 264. A full range of "Pyrene" and other of the firm's proprietory fire extinguishers.

Quicktho (1928), Ltd., Point Pleasant, Wandsworth, S.W.18. Stand No. 147. The firm's well-known window and door operating mechanisms and fittings.

Randle Radiators, Ltd., Chylesmore, Coventry. Stand No. 277. Radiators for all types of commercial vehicles, bonnets, tanks, etc.

Ransome & Marles Bearing Co., Ltd., Newark-on-Trent. Stand No. 354. A complete range of this well-known firm's ball and roller bearings which will include two new designs of ball bearings.

Digitized by Google

Raybestos-Belaco, Ltd., Central House, Kingsway, London, W.C.2. Stand No. 243. Raybestos linings for all purposes in connection with motor vehicle construction.

Reckitt & Sons, Ltd., Hull. Stand No. 312. The "Karpol" car cleaner and polisher available in three sizes, also paints and varnishes.

Redline Motor Spirit Co., Ltd., 10 Charles Street, Haymarket, London, S.W.1. Stand No. 235. Pumps and equipment suitable for the bulk storage of motor spirit, also a number of cans of the various brands of petrol marketed by this company.

Remer Timber Co., Ltd., 25 Victoria Street, London, S.W.1. Stand No. 169. Samples of various woods for body construction.

Ripaults, Ltd., King's Road, St. Pancras, N.W.1. Stand No. 355. A feature will be the firm's central lubricating system (Alcyl Patents) and all kinds of recording and measuring instruments.

Romac Motor Accessories, Ltd., The Hyde, Edgware Road, London, N.W.9. Stand No. 237. A new line of "Romac" air compressors.

Ross, Courtney & Co., Ltd., Ashbrook Road, Upper Holloway, N.19. Stand No. 311. All kinds of turned and pressed parts for commercial vehicle construction, and a useful range of accessories.

Rubery, Owen & Co., Darlaston. Stand No. 206. Chassis frames and pressings generally for chassis construction, and Scott's patent weldless back axle casing.

Rudge-Whitworth, Ltd., Reddings Lane, Sparkhill, Birmingham. Stand No. 350. The firm's patent detachable wire wheels and the multicentric wheel, also various ball and roller bearings.

St. Helens Cable & Rubber Co., Ltd., Slough. Stand No. 374. Solid and cushion tyres, puncture resisting tubes, rubber flooring, radiator hose, etc.

Safety Storage Systems (1927), Ltd., 58 Victoria Street, London, S.W.1. Stand No. 233. Oil storage cabinets with pumps for indoor and outdoor use. Barrel covers and small models of oil storage tanks.

Joseph Sankey & Sons, Ltd., 168 Regent Street, London, S.W.1. Stand No. 353. The feature of the exhibit will be Sankey wheels for a variety of purposes and in a variety of types and various other pressings.

Scintilla, Ltd., 14 Clerkenwell Close, London, E.C.1. Stand No. 281. The exhibit will consist of the Scintilla range of magnetos with rotating magnets instead of rotating armatures, also lighting and starting sets and general electric equipment.

Sheepbridge Stokes Centrifugal Castings Co., Ltd. Sheepbridge Works, Chesterfield. Stand No. 276. The firm's "Centricast" centrifugally cast iron, as used for piston rings, cylinder liners, cylinder barrels, sleeve valves and other similar components.

Shell-Mex, Ltd., Shell Corner, Kingsway, London, W.C.2. Stand No. 202. A feature of the Shell exhibit will be a film depicting the quick starting qualities of Mex the commercial grade of Shell petrol, and the behaviour of Shell oil in engines is also shown graphically.

Silvertown Lubricants, Ltd., Minoco Wharf, West Silvertown, London, E.16. Stand No. 162. Silvertown oils and greases.

Simms Motor Units, Ltd., Percy Buildings, Gresse Street, Rathbone Place, London, W.1. Stand No. 341. A range of Simms magnetos and parts.

Skefko Ball Bearing Co., Ltd., Luton. Stand No. 10. A complete range of the SKF ball and roller bearings.

Small & Parkes, Ltd., Hendham Vale Works, Manchester. Stand No. 324. The Don brand asbestos metallic brake linings and fabrics. The "Jed" monobloc clutch disc, pump packing rings, motor jointings, etc.

S. Smith & Sons (Motor Accessories), Ltd., Cricklewood Works, London, N.W.2. Stand No. 299. Instrument panels, speedometers and other recorders, windscreen wipers, carburetters, lighting and starting equipment, radiator shutters, tyre inflators.

Thomas Smith & Sons of Saltley, Ltd., Saltley Mill, Birmingham. Stand No. 165. Drop forgings for the motor and allied trades as well as accessories such as spanners, hammers, etc.

Thomas Smith's Stamping Works, Ltd., Ribble Road, Coventry. Stand No. 357. A comprehensive display of drop forgings for engine, transmission and chassis parts, in steel and duralumin, also in "Y" alloy.

Snowdon, Sons & Co., Ltd., Millwall, London, E.14. Stand No. 315. The firm's Royal Snowdrift motor oils and greases are to be exhibited.

Solex, Ltd., 223/231 Marylebone Road, London, N.W.1. Stand No. 359. A complete range of horizontal and vertical Solex carburetters for commercial vehicles.

Sorbo Rubber Sponge Products, Ltd., Sorbo Works, Woking. Stand No. 195. A number of examples of Sorbo sponge rubber upholstery suitable for public service vehicles will be shown. Also Sorbo luxury flooring.

Specialloid, Ltd., Friern Park, North Finchley, N.12. Stand No. 273. A comprehensive range of Specialloid aluminium alloy pistons.

Spiral Tube & Components Co., 12 Pembroke Street, King's Cross, London, N.1. Stand No. 325. A selection of radiators and tube blocks, made by this firm for various well-known motor manufacturers.

Stadium, Ltd., 75-77 Paul Street, Great Eastern Street, London, E.C.2. Stand No. 171. Hydraulic jacks, mirrors, horns, ash trays, etc.

Stedall & Co., Ltd., Broad Street, Bloomsbury, London, W.C.2. Stand No. 216. General ironwork, tipping gear, trailer under gear, coach and bus fittings, engineers' tools and machinery, garage equipment, paint and painters' sundries, lamps, etc.

Steel Stampings Company, Cookley, near Kidderminster. Stand No. 288. Disc wheels for solid and pneumatic tyres, welded steel bands and a variety of steel pressings.

Sternol, Ltd., Royal London House, Finsbury Square, London, E.C.2. Stand No. 300. A complete range of Sternol oils and greases, bulk storage outfits, etc.

J. A. Stevens, Ltd., Upper Rathbone Place, London, W.1. Stand No. 180. As sole agents in this country for Bosch products such as magnetos, dynamos, electric starters, sparking plugs, horns, spot lights, lubricators, windscreen wipers and accessories all of Bosch manufacture, examples of each will be on view.

J. Stone & Co., Ltd., Deptford, London, S.E.14. Stand No. 219. Various brand white metals, bronzes, gun metals, etc., for use in motor construction.

Sunsaloon Bodies, Ltd., Castleford Road, Sparkhill, Birmingham. Stand No. 193. The Sunsaloon head is much in evidence throughout the exhibition. On this stand the firm will show all the fittings for this type of head for coaches, etc.

Leo Swain & Co., Ltd., 247/251 Deansgate, Manchester, Stand No. 322. Accessories and parts such as autovacs, batteries, ball bearings, chains, sprockets, couplings, lamps, tubing, magnetos, mirrors, pumps, springs, speedometers, garage equipment, etc.

Tecalemit, Ltd., Mitre House, Scrubbs Lane, Willesden, London, N.W.10. Stand No. 360. This firm's system of lubrication is now so popular and well known that there is no need to detail the exhibits interesting as they no doubt are, but the following novelties are exhibited for the first time:—The automatic central lubrication which is the standard system but derives its power from an automatic pump. The pumping mechanism is enclosed in a container holding sufficient oil for at least 300 miles. The automatic energy for driving the pump is derived from the slight jolts imparted to the car while running on the road. Over rough surfaces, therefore, the pump receives more impulses and shackle pins, etc., receive more lubricant. Another pump is the electric petrol which supplies the carburetter under power, ensuring a regular supply proportionate to the engine under all conditions. It eliminates the possibility of a stoppage in the petrol supply, and when the engine is stopped it acts as an automatic cut-off thus preventing wasteage of petrol. There will also be a Delco lubricator which is a gravity feed type for Delco distributors. A Lap pump for emptying oil barrels or drums, also lorry petrol filters, fuel oil and air filters.

Texas Oil Co., Ltd., Wellington House, 125 Strand, London, W.C.2. Stand No. 238. There will be a gear box showing Texaco Thuban compound B under working conditions. Equipment consisting of a 100-gallon inside storage tank and a 100 lb. Thuban compound outfit; also oils and greases.

Christr. Thomas & Bros., Ltd., Broad Plain, Bristol. Stand No. 201. Glycerine solution for the prevention of damage to radiators by frost. The effect will be demonstrated.

Thornley & Knight, Ltd., Bordesley Green Road, Birmingham. Stand No. 317. Paints, varnishes, japans and enamels.

Timson Bros., Moor Street, Birmingham. Stand No. 156. Garage and service station equipment, spare parts and accessories.

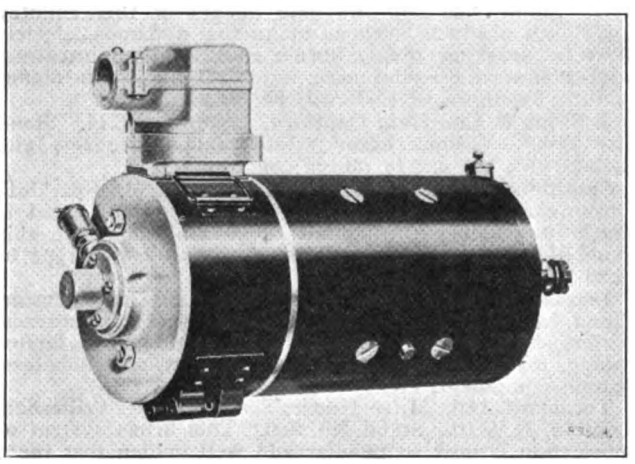
Triplex Safety Glass Co., Ltd., 1 Albemarle Street, London, W.1. Stand No. 143. Windscreens, wondows and goggles with Triplex glazing.

Digitized by Google

Hubert H. P. Trist & Co., 50 Victoria Street, Bristol. Stand No. 197. This firm will show the "Top Dog" brand of friction linings.

Vacuum Oil Company, Limited, Caxton House, Westminster, S.W.1. Stand No. 330. A feature of interest on the stand will be various examples of engine, transmission and chassis components which have suffered as a result of faulty lubrication. The firm's well-known Delvac mechanical lubricator, for steam engines and steam wagons, internal combustion engines and all types of works machinery, will be shown in operation with various forms of drive. In addition, applicable numbers of the Gargoyle Technical Series publications will be available, also an entirely new manual entitled "Petrol driven Commercial Vehicles." Lubricants for all types of petrol and steam-driven commercial vehicles are, of course, supplied by this well-known concern.

C. A. Vandervell & Co., Ltd., Acton, London, W.3. Stand No. 304. The firm's representatives on this stand will be chiefly concerned in giving publicity to developments and refinements of the compensated voltage control lighting system which has met with much success during the past five years. The latest activities include the development of a range of C.A.V., NIFE alkaline batteries, suitable for self-starter work, and a complete range of magnetos suitable for all classes of commercial vehicles. They will also be showing the Luvax hydraulic shock absorber and the Luvax—Bijur central chassis lubricating system. There will be a complete range of 1930 designs including a demonstration Super-Lit bus



THE C.A.V. COMPENSATED VOLTAGE DYNAMO.

installation of the compensated voltage control system. There will be C.A.V. road lamps of robust construction, specially designed for heavy passenger and goods vehicles. A new range of magnetos for all commercial vehicles and C.A.V. lighting and starting batteries.

Vaughan Brothers, Eagle Stamping Works, Willenhall. Stand No. 244. Drop forgings for the motor industry generally.

Venesta, Ltd., Vintry House, Queen Street Place, London, E.C.4. Stand No. 9. The firm will be showing "Plymax"—the metal-faced plywood; also other Venesta products, such as birch, mahogany and oak plywood and shaped bucket seats.

Vigzol Oil Refining Co. (London), Ltd., Eastney Street, Greenwich, London, S.E.10. Stand No. 20a. A full set of samples of Vigzol non-absorbent motor and tractor oils together with special equipment for grease and gear oil. There will be a demonstration engine showing the actual lubrication.

C. C. Wakefield & Co., Ltd., Wakefield House, 30 & 32 Cheapside, London, E.C.2. Stand No. 261. A range of the firm's famous Castrol motor and gear oils and greases and a display of lubrication guns and fittings and oil storage equipment.

Ward & Goldstone, Ltd., Frederick Road (Pendleton), Manchester. Stand No. 236. A wide range of automobile wires and cables and numerous electrical accessories.

Wayne Tank & Pump Co., Ltd., 42 Newlands Park, Sydenham, London, S.E.26. Stand No. 228. There will be ranges of petrol and oil pumps, car washers and compressors.

Henry Wells Oil Co., Ltd., 11 Haymarket, London, S.W.1. Stand No. 214. An apparatus used for the Air Ministry's test for the oxidisation of lubricating oils, and the firm being proprietors of the Wells-Southcombe patented process for increasing "oiliness" of lubricating oils will show a special apparatus as used by them for testing "oiliness." There will be "Germ" lubricating oils and "Filmac" and "Filmis" cutting oils.

Wellworthy, Ltd., Radial Works, Lymington, Hants. Stand No. 246. A range of the firm's piston rings.

Westinghouse Brake & Saxby Signal Co., Ltd., 82 York Road, King's Cross, London, N.1. Stand No. 149. There will be a working exhibit of the firm's compressed air brake, also of the Vacuum servo brake; the brakes will be also shown in parts.

Job. Wheway & Son, Ltd., Green Lane, Walsall. Stand No. 209. A comprehensive range of Wheway Lion brand non-skid chains.

Thos. Whittingham & Wilkin, Ltd., 39-45 Neal Street, Long Acre, London, W.C.2. Stand No. 265. General upholstery, trimmings, fittings and accessories.

Wilcot (Parent), Co., Ltd., 150 Great Portland Street, London, W.1. Stand No. 205. The firm's well-known "Wefco" spring covers will be on view, and amongst other specialities the Wilcot oil pump, radiator muffs, bonnet covers, "Bristol" foot pumps, "Safety" windscreen wiper blade, "Noleex" radiator cement, "Eagan" car washers, the "Eco" automatic air station and air compressor, etc.

W. H. Willcox & Co., Ltd., 38 Southwark Street, London, S.E.1. Stand No. 336. The special feature of the exhibit will be a full range of the firm's well-known lubricating oils, special brands being supplied to suit well-known makes of vehicles, both steam and petrol. There will also be a very comprehensive range of engineers' stores suitable for the motor industry.

Williams & James, Chequers Bridge, Gloucester. Stand No. 260. A range of air compressors and mechanical tyre pumps, also car washers.

Jonas Woodhead & Sons, Ltd., Kirkstall Road, Leeds. Stand No. 179. Laminated springs for all transport purposes together with several Woodhead patent spring fittings.

Zenith Carburetter Co., Ltd., 40/44, Newman Street, London, W.1. Stand No. 351. A full range of the well-known Zenith carburetter, the popular type will be in evidence as well as the pump type. Sectional carburetters will be shown.

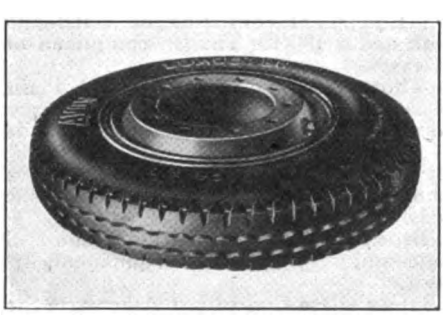
Tyre Section.

Avon India Rubber Co., Ltd., 345/5, Euston Road, London, N.W.1. Stand No. 372, Gallery. High pressure "Giant" pneumatics for straightside rims: An entirely new range of Avon "Loadster" (heavy duty)



THE AVON "LOADSTER" TYRE.

covers carrying a new buttressed tread design and built throughout to new specifications. Sizes from 27 by 6 (15 in. diameter wheels) to 42 by 9 (24 in. wheels). New "Loadster Extra-heavy" covers, 32 by 4½, 30 by 5, 33 by 5 and 32 by 6. New chevron-grooved tractor covers, sizes 32 by 4½, 33 by 5 and 36 by 6. High-pressure beaded-edge cover, 955 by 155 only. Low-pressure (Bus Balloon) covers for straightside rims. A complete new range of low-pressure tyres with novel buttressed tread pattern and constructional features. From 34 by 7.50 to 40 by 10.50, fitting rims of 20 in., 22 in. and 24 in. diameter. Air-cushion tyres of the latest "Loadster" type in 14 popular sizes, carrying loads of 13 cwt. to 36 cwt. per tyre. Solid tyres in a new cut-resistant, slow-wearing and cool-running "mix." All standard and many obsolescent sizes available, including "giant singles" of 8 in. to 14 in. section. Fire engine tyres, being special non-skid solids as fitted by L.C.C. and other brigades. Truck tyres. Plain "deep section" and grooved solid tyres for industrial trucks, low-loading

Digitized by Google

vehicles, etc. "Trojan" and tractor tyres being non-skid solids for special vehicles, including sizes 28 by 2½, 26 by 3½/20 and 40 by 5/34, and an appropriate range of Avon repair sundries and accessories. The House of Avon has made rubber goods and tyres at Melksham since 1885. It is one of the few old-established rubber manufacturers who have "stayed with" the tyre industry since the war, and its present renewed activity reveals a spirit of enterprise. New specifications for practically every tyre in the range, from cycle to coach sizes, have been devised and subjected to series of searching tests beginning in the laboratories and ending (where such tests must end) on the road. Space prevents a technical description of the new Avon tyres or any attempt to compare their materials or constructional features with the former products. In most cases there is a new tread pattern—again the result of well-designed tests, efficiently observed—but even where familiar designs are retained there has been radical revision of specifications, methods of building-up and vulcanization.

Bergougnan Tyre Co., 95-98, White Lion Street, Islington, London, N.1. Stand No. 371. The firm will show their standard solid, dissymmetrical, deep resilient and giant solid tyres.

British Goodrich Rubber Co., Ltd., 50, Pall Mall, London, S.W.1. Stand No. 367. The firm will show its range of pneumatic tyres for commercial vehicles, including giant pneumatics and solids, also Wood Milne solid tyres nad its own tyre accessories.

J. W. & T. Connolly, Ltd., 57/67, Wharfdale Road, King's Cross, London, N.1. Stand No. 380. The exhibits will be as follows:—The patent rubber bumper; the patent air cushion tyre; band tyres for all classes of motor vehicles; wooden and steel disc wheels for solid and pneumatic tyres; aluminium and rubber step tread mats, moulding and strip. Commercial motor vehicle sundries, axles and springs.

Dunlop Rubber Co., Ltd., Fort Dunlop, Birmingham. Stand No. 364. The exhibit will consist of:—Giant pneumatics, high pressure and balloon tyres, will be shown. There will also be exhibits of cushion and solid tyres as well as a selection of Dunlop industrial truck tyres and a comprehensive range of Dunlop wheels. A complete range of accessories will be on view.

Englebert Tyres, Ltd., 162, Great Portland Street, London, W.1. Stand No. 368. The firm will be showing various sizes of their improved reinforced giant pneumatic tyres, which are making themselves popular by reason of their extra strong walls, tough treads and grip on the road. They will also be showing their bus balloon tyres, in which they make a full range for 20 inch rims and which can be fitted, in many cases, to existing wheels. A feature of interest will be the new moulded inner tube with a special unleakable join. Enquirers for conversions, in either giant tyres, bus balloons or taxi balloon tyres, will be welcomed.

Firestone Tyre & Rubber Company (1922), Ltd., Great West Road, Brentford, Middlesex, England. Stand No. 378. A comprehensive range of the gum-dipped heavy duty giant pneumatic cord covers, together with circular moulded high test tubes. Front and rear hubs for conversion to pneumatic tyres, together with wheels and rims. There will also be a full range of accessories, and repair materials.

Goodyear Tyre & Rubber Company (Great Britain), Limited, Bushbury, Wolverhampton. Stand No. 370. The exhibits are as follows:—"All Weather Tread" giant pneumatic high pressure covers and tubes and low pressure covers and tubes, also rims and disc wheels.

Henley's Tyre & Rubber Co., Ltd., 20/22, Christopher Street, Finsbury Square, London, E.C.2. Stand No. 377. The exhibit will consist of the firm's solid, air cushion and giant pneumatic tyres. The solid tyres are made in all British standard sizes and in inch sizes interchangeable with American S.A.E. standard sizes. They also supply a number of non-standard sizes. Also big single giant solid tyres, air cushion tyres from 2½ in. to 4¾ in. section and in millimetre sizes from 100 m.m. section to 140 m.m. section. Also trolley tyres from 3½ in. section to 7 in. The giant cord tyres are supplied in from 30 in. by 5 in. sizes to 40 in. by 8 in.

India Tyre & Rubber Co. (Great Britain), Ltd., Inchinnan, Scotland. Stand No. 366. The exhibits will consist of:—Straight side heavy service double-oversize high pressure giant covers. Straight side heavy service balloon bus covers. Straight side medium and low pressure covers. Heat-proof blue tubes for use with the above-mentioned covers. All the above are insured for the first six months of their lives against all road damage.

Chas. Macintosh & Co., Ltd., Cambridge Street, Manchester. Stand No. 375. On this stand will be exhibited Macintosh solid, N.A.P. and taxi tyres.

Pirelli, Ltd., 144, Queen Victoria Street, London, E.C.4. Stand No. 365. The range of solid tyres will consist of "S" type wide singles, with a tractive non-skid tread; smaller section singles; and "G" twins. The semi-pneumatic air core tyre, which can be fitted in place of solids without wheel or rim change, will be displayed. There will also be the giant pneumatic cord tyre and tube.

Poppe Rubber & Tyre Company, Twickenham, Middlesex. Stand No. 369, Gallery. The principal exhibit will be the Poppe reinforced construction, cool running solid tyre, suitable for long distance work with heavy loads. The exhibit will also include a range of tyres for low loading vehicles, trailers and trucks. Other items include tractor pads for extra heavy haulage. A full range of radiator tubing, suction hose for steam waggons and rubber sponge in various forms for matting and upholstering work, together with other rubber lines of general interest to the motor trade.

Seiberling Tyre Co. (Great Britain), Ltd., 146-7-8, Tennant Street, Birmingham. Stand No 376. The exhibit will consist of special service cord covers of 6 in., 7 in. and 8 in. section.

Trowbridge Tyre and Rubber Co. (1929), Ltd., 54, Victoria Street, London, S.W.1. Stand No. 379. The exhibit will consist of Spencer-Moulton solid band tyres and giant pneumatic tyres and tubes, auxiliary buffers for springs and trolley tyres.

At the time of going to press we have not heard from the following firms, who will also be exhibiting:—

Commercial Vehicle and Body Work Section.

Arlington Motor Co., Morley House, Regent Street, London, W.1, Stand No. 94. Austin Motor Co., Ltd., Longbridge Works, Northfield, Birmingham, Stand No. 38. Soc. Anon. Fab. d'Automobiles Berna, Olten, Switzerland, Stand No. 34. Elkington Carriage Co., Ltd., Great West Coach and Motor Works, Chiswick, London, W.4, Stand No. 21. Hoyal Body Corpn. (1928), Ltd., Hoyal Works, Weybridge, Surrey, Stand No. 93. Phoenix Coachworks, Ltd., 9/10, Pancras Lane, London, E.C.4, Stand No. 15. Spurling Motor Bodies, Ltd., Bedford Works, Old Oak Lane, Willesden, London, N.W.10, Stand No. 121.

Accessory, Component and Garage Equipment Section.

Railway Notes and News.

Railway Clearing House. New Chairman.—Sir Francis H. Dent, a Director of the Southern Railway, has been unanimously elected Chairman of the Railway Clearing House in succession to the late Sir Edmund Turton.

SIR FRANCIS H. DENT.

L. N. E. R. Appointments. — We are officially informed that the London and North Eastern Railway have made the undermentioned appointments: Mr. W. Philip, Chief Accountant's Office, King's Cross, to be Divisional Accountant, Scottish Area, with Headquarters at Edinburgh, in succession to the late Mr. R. Brown. Mr. O. H. Corble, Assistant District Goods Manager, Newcastle-on-Tyne, to be Assistant to Goods Manager, N.E. Area, with Headquarters at York, in succession to Mr. S. T. Burgoyne, who was recently appointed as Manager to the Cheshire Lines Committee. Mr. E. A. Lees, Chief Assistant to District Engineer, Manchester, to be District Engineer, Manchester, in succession to the late Mr. J. B. Kirby.

New G.W.R. Director.—It is announced by the Great Western Railway that Major the Hon. J. J. Astor, M.P., has been elected a director of the company, to fill a vacancy on the Board.

The Minister of Transport and the Railways.—Speaking at a meeting under the auspices of the Railway Clerks' Association, at the Paddington Town Hall, on October 25th, Mr. Herbert Morrison, M.P., Minister of Transport, referred to the various activities of the Government in connection with the railways. Under the Development Act, the railway companies had been invited to submit proposals for re-equipment with a view to improving the efficiency of the railway system. A large number of proposals were being received from the Railway Companies, examined by the Ministry of Transport and considered by the Committee under the Development Act, presided over by Sir Arthur Duckham. Inevitably, the preparation of proposals by the companies and their examination by the Government must take some little time, but everything was being decided with the utmost despatch. Some schemes had already been authorised, whilst a considerable number of others would come forward soon. The Government had had under consideration the whole problem of the electrification of the main line railways. He had an open mind on the economic and traffic aspects of the matter, though he had no doubts from the point of view of public amenity. The purpose of the committee which had been appointed, under the Chairmanship of Lord Weir, was to examine the question as a technical and business proposition, and the work of this committee could not be divorced from the earlier work of electrical policy which has been conducted by a former committee under Lord Weir, leading up to the passing of the Electricity (Supply) Act, 1926. In settling the membership of the committee he had, in the first place, definitely taken the view that this was a business inquiry, and did not involve any political issue. It was important that the railway companies should not only participate in the work of the committee itself, but that one of their leading men should be there in order that authoritative information, accepted by the companies themselves, should be before the committee in regard to the technical side of railway operation. In the next place, speed was the essence of the matter, and he had considered it necessary that the committee should not exceed three in number. He was grateful to Lord Weir, Sir Ralph Wedgwood and Sir W. McLintock for giving their services.

Sir Henry Thornton's New Contract.—An Ottawa message says that an Order in Council has been passed extending the contract with Sir Henry Thornton, the President of the Canadian National Railways, for a period of five years, at a salary of 75,000 dollars (£15,000) annually, dating from October, 1928. It is understood that Sir Henry was consulted by Mr. J. H. Thomas during his recent visit to Canada with regard to accepting an offer from the British Government to supervise railway organisation in Great Britain and other large construction plans. Sir Henry, however, preferred to remain in Canada as head of the Canadian National Railways, which is the largest railway organisation in the world under public ownership. As President he has been an outstanding success.

Schemes to Relieve Unemployment. Great Western Railway to Spend £5,000,000.—Sanctioned under the Government's scheme for the relief to unemployment, the Great Western Railway propose to spend £5,000,000 and to proceed immediately with schemes of development at Paddington Station, Bristol, Cardiff, Olton to Rowington Junction, Taunton, Westbury and Frome, Wolverhampton, Banbury, Severn Tunnel Junction, Rogerstone, Swindon, Paignton, Bugle to Goonbarrow Junction, Scorrier to Redruth, Cardiff (Cathays). New locomotive depots, engine sheds, etc., are to be provided at Pantyffynnon, Landore, Cardiff East Dock, Radyr, Duffryn Yard, Port Talbot Treherbert. It is proposed also to lay 51 miles of track with steel sleepers and it is estimated that a total expenditure on steelwork and machinery will be in the neighbourhood of £1,000,000.

L.M.S. Motor Vehicles at the Commercial Motor Show.—The following London Midland and Scottish Railway Company's vehicles are exhibited at the Commercial Motor Vehicle Show now in progress at Olympia and may be seen on the stands of the firms whose names we print in brackets:—Passenger Vehicles: A.E.C. 21-seater (Harrington Ltd.); Albion 24-seater (Albion Motor Car Co., Ltd.); Albion 19-seater (London Lorries, Ltd.); Leyland Titan 51-seater (Leyland Motors, Ltd.) (Crosville L.M.D.) (Double Deck). Goods Vehicles: Karrier 10-ton Tractor Trailer (Karrier Motors, Ltd.); Thornycroft 10-ton 3-way Tipper (J. I. Thornycroft & Co., Ltd.); Karrier 4-ton G.H.5 (G. Kenning & Sons); McCormick-Deering Shunting Tractor (International Harvester Co., Ltd.).

MR. S. T. BURGOYNE, M.V.O., O.B.E.

Mr. S. T. Burgoyne, M. V. O., O.B.E., Appointed Manager of the Cheshire Lines Railway. — Mr. S. T. Burgoyne, M.V.O., O.B.E., of the staff of the L.N.E.R. at York, has been appointed Manager of the Cheshire Lines Railway, in succession to Mr. A. P. Ross, who has been appointed Stores Superintendent at King's Cross. Mr. Burgoyne, who was made Assistant Goods Manager at York in 1925, was with the North Eastern Railway at Hull for a number of years prior to the war, and later filled important positions in the Chief Goods Manager's Office and General Manager's Office at York. In May, 1915, he joined the Ministry of Munitions as personal assistant to Sir Eric Geddes and in 1916 went to France and was made Deputy Assistant Director-General of Transportation. Later, he went to the Admiralty as one of the private secretaries to the First Lord of the Admiralty. Occupying posts in the Ministry of Transport during four years following the formation of the Ministry in 1919, he returned to the railways in 1923 and became Industrial Agent to the London and North Eastern Railway. He was promoted to the position of Assistant Goods Manager of the North Eastern Area at York.

Motor Show Dinners.

AMONGST the numerous functions which always form a part of the Motor Show activities the following deserve mention:—

Society of Motor Manufacturers and Traders. Annual Dinner.

This, the chief Banquet of the Show, was held at the Connaught Rooms on Wednesday, October 16th, when the President, Mr. J. Maughfling, presided over a gathering which filled every part of the great hall. He was supported at the top table by leading members of the motor industry as well as a large number of distinguished guests, the latter including Mr. Herbert Morrison, M.P., Minister of Transport, the Rt. Hon. Lord Russell, Parliamentary Secretary, Ministry of Transport, and Mr. John N. Willys, well-known to the motor industry in this country, as well as in the United States, as the President of the Willys Overland Crossley Company over here, and the late President of the Willys Overland organisation in the United States.

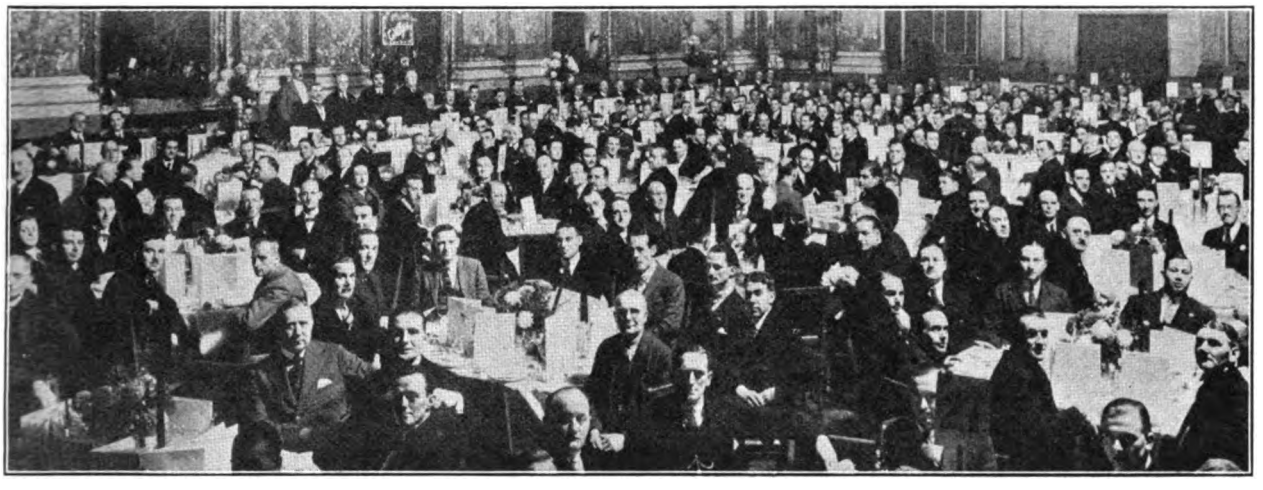
A very thoughtful and well reasoned speech was made by the Minister of Transport, in the course of which he made the announcement that the Government intended to introduce the Road Traffic Bill during the present Session of Parliament. This was welcome news to those who had been anxiously awaiting this Bill for the past two years under the previous Government. A very interesting speech was made by Mr. Willys, divided into two sections, the first being of a racy and humorous character, with several stories told in the inimitable American style, the second striking a note of seriousness and dealing with the relationship between this country and the United States of America. Sir George Beharrel, who proposed the toast of the visitors, spoke in his usual clear and incisive manner, and Earl Howe, who also responded with Mr. Willys, enlivened the gathering by his remarks.

Willys Overland Crossley Dinner.

Another interesting function was the Willys Overland Dinner, held at the Hotel Cecil on October 18th, when the agents, friends and members of the press were invited to meet Mr. John N. Willys. Sir William Letts, the Chairman and Managing. Director of the Company, presided and was supported by Mr. A.R. Atkey, Lord Mayor of Nottingham, and Sir William Sleigh. The evening passed with great enthusiasm, which was enhanced by some excellent community singing under the leadership of the orchestra. Sir William Letts, in his speech as Chairman, touched on a number of subjects in which the agents were particularly interested and introduced Mr. Willys. Mr. Willys, in his speech, referred to the fact that he had disposed of a considerable portion of his interest in the American concern of Willys Overland and was no longer on the pay roll. He was therefore in a position to give more time to the English business and he hoped to be in this country much more frequently than in the past. Mr. Atkey, in responding to the toast of the Agents and Guests, said that the best thing Mr. Willys could do would be to make the Willys Overland vehicles 100 per cent. British.

Dodge Bros. Dinner.

Agents and Guests were invited on Monday, October 21st, to dinner at the Holborn Restaurant to meet Mr. E. C. Morse, President, Chrysler Export Corporation, and officials of Dodge Bros., Inc., Detroit. The chair was taken by Mr. S. D. Briggs, European General Manager, whose headquarters are at Antwerp, and he was supported by Mr. C. Morton Lomax, the Managing Director of the British Company. Following the dinner the Chairman announced that several members of the organisation would speak for a few minutes, more in order that those present might get to know them than for anything important they might say. Before this was done he briefly referred to the activities of each of the members who would speak. These included Mr. Sutherland Pilch; Export Manager for the East, Mr. Ware, Chief of Staff of the British Company, Mr. Fortescue, Sales Manager, and Mr. Welch Lee, of the Publicity Department.



WILLYS OVERLAND CROSSLEY DINNER TO DEALERS AND AGENTS. STANDING AT TOP TABLE, LEFT TO RIGHT: MR. A. R. ATKEY, MR. JOHN N. WILLYS, SIR WILLIAM M. LETTS, K.B.E., AND SIR WILLIAM SLEIGH.

S. F. Bowser & Co., Inc.

Members of the press were invited to meet Mr. S. B. Bechtel, the President of S. F. Bowser & Co., Inc., at an informal luncheon, held at the Trocadero Restaurant. Mr. R. G. Shulze, European Managing Director, presided, supported by Mr. Morton, London Manager, and Mr. S. O. Shave, Manager, Publicity Department. After a few introductory words the Chairman called upon Mr. Bechtel to speak, and he opened with a brief but interesting talk on the relationship between the two countries of Great Britain and the United States. Following one or two questions, Mr. Bechtel then told us something about the early days of the firm, who are the pioneers of piston type measuring pumps, the firm having been started by Mr. Bowser in 1885. The name of the first petrol service station was coined by a salesman of S. F. Bowser & Co., Mr. J. D. Gumpper, in 1908, and was the result of a successful attempt to bring a pipe from the petrol tank out from the front of the wooden garage to obviate the necessity for the motor car to be taken inside. By easy stages the petrol pump was developed and improved, and as an outcome of a disastrous fire, which took place in St. Louis, in 1910, the firm started to build special tanks for storage underground. These, at first did not meet with the approval of the authorities, and it took two years to persuade them that this method was safer than any other kind. It is interesting to record that in 1907 the company had a staff of 400 employees, in 1929 this has grown to 1,800.

The F.W.D. Three-Wheeler.

FOUR WHEEL DRIVE MOTORS, LTD., 46 Charing Cross, London, S.W.1., are now producing the handy dump wagon as illustrated. As can be seen it is a three-wheel vehicle and it is fitted with a three-way hydraulic tipping body. Its overall length is 13 ft. 8 in., and the wheelbase is only 8 ft. 3¾ in. The diameter of its turning circle is only 17 ft. The carrying capacity is from 2 to 2½ tons.

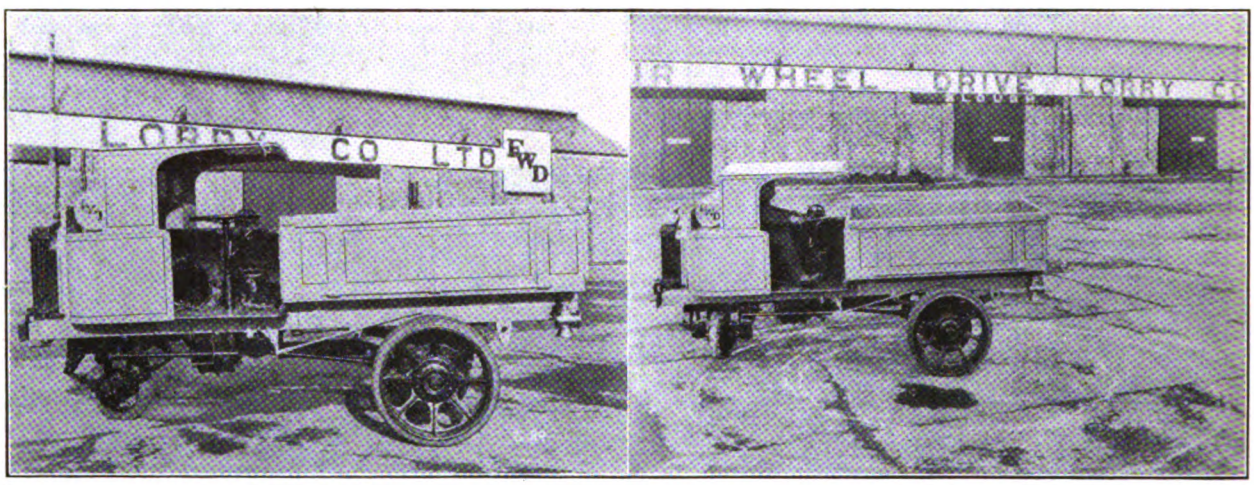
With regard to design, as far as possible standard units are used so as to give interchangeability with the firm's standard F.W.D. models, and users can obtain spares and service from various F.W.D. agents throughout the country.

The engine has a bore of 4¾ in. and stroke 5½ in. It has a rated horse power of 36, but actually develops 56 b.h.p. The engine is placed on the left hand side of the chassis, and the standard F.W.D. three-speed gear box is alongside of it to the right. Power from the engine is transmitted through a totally enclosed triple roller chain running in oil and having a ratio of 1 to 1. The gear provides three speeds:—16, 8 and 4 m.p.h. respectively.

very considerably owing to the restricted headroom of certain archways, and the end of the horizontal "drop arm" is connected up with another lever, connected to a vertical shaft, on the upper end of which is a chain sprocket, connected by a triple roller chain to a sprocket attached to the king-pin, which is rigidly on the turntable. These sprockets are of unequal size, the smaller being attached to the king-pin, and their ratio is such that for a 90 degrees movement of steering drop-arm, the turntable rotates nearly 180 degrees.

In order to take full advantage of the steering lock with the third wheel, independent braking is applied to the two driving wheels, so that the inner wheel may be held stationary, allowing the machine to pivot about it. If this is not done, when the steering wheel has reached a certain lock, it would be dragged along sideways. This independent braking is effected by a lever on the driver's right, the handle of which is close to the steering column.

Compensation of the hand brakes on the driving axle is provided by a perch bar, and at each end there is a catch



• THE NEW F.W.D. 3-WHEEL TRUCK DESCRIBED IN TEXT.

The front axle, which is also the driving axle, is of standard design, the only modification being that the bevel pinion is almost exactly central with the chassis and not offset as on the standard F.W.D.

The wheels, which are of cast steel are fitted with 36 in. by 5 in. solid tyres. The hand brake operates internal expanding brake shoes in the wheel drums. The foot brake is on the transmission. The third wheel, also of cast steel, is fitted with a 20 in. by 6 in. solid tyre, and has roller bearings interchangeable with those of the driving wheels, and it is carried on a turntable. Inserted between the rings of the turntable, is a bronze ring of H section, the flanges at the edges being intended to keep it central with the rings, and to hold the grease. In holes bored in this ring are a number of steel balls slightly larger in diameter than the thickness of the bronze ring, so that the turntable is actually carried on a large thrust ball bearing.

To take full advantage of the third wheel on short turns, a larger angle is necessary on the turntable in comparison with the angle of the ordinary stub axle. To take care of this, a standard steering column is used, but is shortened

mounted on a shaft connected to the hand lever referred to above, so that if the lever is moved in one direction the catch drops and prevents that end of the perch bar from moving forward, while movement of the lever in the opposite direction holds the other end of the perch bar. So soon as this lever has been moved, the hand brake may be applied, and will only act on the side which is not held by the catch on the perch bar.

For convenience, the movement of this hand lever is in the same direction as the steering wheel; that is, the lever being on the driver's right, he would naturally push the steering wheel forward with his right hand, and would push this lever forward, while in the opposite direction the lever would be pulled back.

Cooling of the machine is by ordinary gilled tube radiator, at the rear, the fan being of the "pusher" type, and in view of the work this machine is called upon to do, this is found very efficient.

The body is 7 ft. long, fitted with 20 in. drop sides, the whole being lined with sheet metal, while a specially low cab with overall height of 7 ft. 3 in. is provided.

National Automobile Show, New York.

MONDAY, January 6th, next, has been designated as International Day, in honour of visitors from other countries to the Thirtieth Annual Automobile Show to be held in Grand Central Palace, New York, January 4-11th, 1930. At a special International Day Conference on Monday morning, January 6th, visitors will have an opportunity to meet and talk with executives of automobile factories, and in the afternoon guests from overseas may inspect the Automobile Show at Grand Central Palace, where the products of 360 manufacturers of motor vehicles and automobile accessories will be exhibited. On Tuesday evening, January 7th, will be held the Annual Show Banquet at the Hotel Commodore and leading figures of the motor industry will attend. Guests will be welcomed at the New York Headquarters of the National Automobile Chamber of Commerce, 366 Madison Avenue, on the opening day of the Show, Saturday, January 4th.

Plans for Better Service.

General Motors Scheme for Improving the service rendered in connection with Chevrolet Chassis.

(By a special contributor).

The greatest boon which can be conferred on transport users is the provision of efficient service. The first essential for a satisfactory transport organisation is undoubtedly the possession of reliable and dependable vehicles, but the very best of these needs attention at more or less frequent intervals according to use, and it is in the provision for that attention that so many find difficult.

Nowadays, fortunately, most commercial vehicle agents appreciate how necessary adequate service is to their customers, but the best of them is liable to be let down by their staff. Garage mechanics are a mixed lot and it would be rather wonderful for any employer to have at his disposal a set of men who were 100 per cent. reliable. Any defective repair is usually traceable to carelessness on the part of a not particularly efficient member of the works staff.

There is another point about repairs too: they are liable to be so very costly and next to availability of efficient service some reduction in the cost of it is most desirable. Now this can only be achieved, other things being equal, by the more extensive use of garage equipment together with ability and willingness on the part of the staff to use that equipment. It is clear, therefore, that the problem of the provision of efficient and reasonably priced service turns on two things; on the use of proper equipment and on the education of garage staffs in the use of that equipment and in the efficient handling of repair work generally.

This problem is solved, in both its aspects, for Chevrolet users by a new scheme which has just been put on foot by General Motors, Ltd., at Hendon, where a portion of the floor space of their huge factory has been set apart for educating the staffs of Chevrolet agents in just those things we have discovered to be so essential.

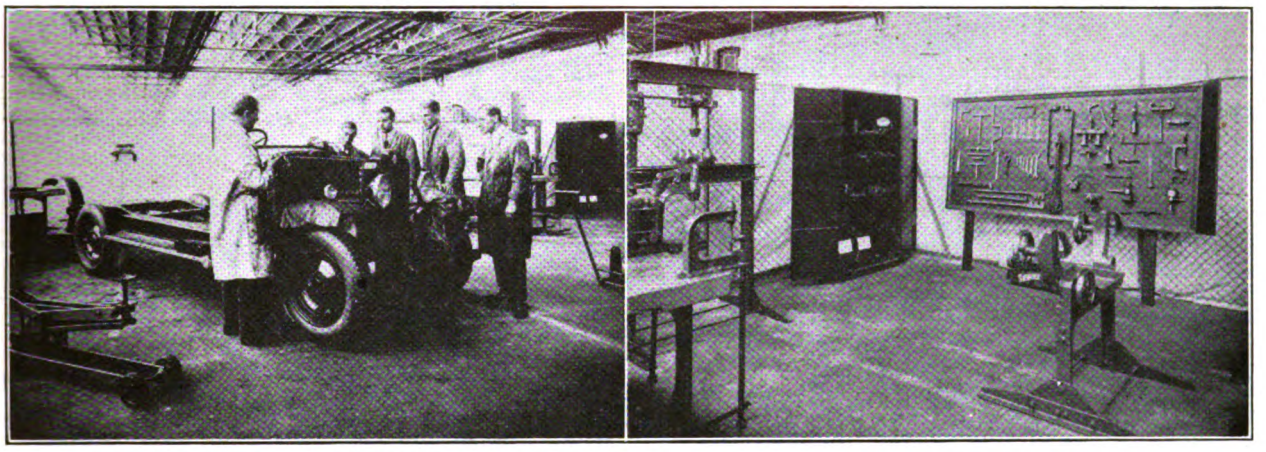
This department, named the School of Instruction, occupies an area of approximately 60 ft. by 24 ft. It is divided into three parts, a general shop, a tool room and tool stores. The purpose of the first is to enable demonstrations in the handling of repairs and service in connection with Chevrolet chassis to be carried out in actuality. In the tool room components of this same make of chassis are handled in the way in which they should be handled, while the tool stores serves as a model of its kind and is perhaps the more effective as an instructional institution in that it also serves in the same capacity in relation to General Motors' own service department at Hendon.

The equipment in these departments has been carefully selected as being that which Chevrolet agents should themselves possess in order that they may effect repairs and service most expeditiously and at least cost.

In the general shop the principal items include a car hoist, G.E. Hyer Lift Jack, a set of car props, a complete Denterazer outfit with wing irons and other supplementary tools for repairing wings, a complete G.E. brake testing outfit by which the effectiveness of the brakes on all four wheels can be tested at once, a couple of benches and some body repair apparatus.

In the tool room is a G.E. Universal engine stand, an axle support, ten and twenty-ton presses, brake lining drilling and countersink machine, brake lining riveting fixture, connecting rod aligner and straightener, piston vice, all made by Joseph Bradbury & Sons, Ltd., of Braintree. There is a comprehensive and complete set of wrenches, both socket and open type, and a set of wheel drawers as well as other items of equipment too numerous to mention, and including a special set of socket wrenches known under the trade name of Britool and made by the British Tool & Engineering Co., Ltd.

In the tool stores are all those small tools customarily found in most departments of this kind but here properly kept and only handed out under a system which ensures the instant location of any tool whenever it may be wanted.



LEFT: EXPLAINING THE ACTION OF THE PETROL PUMP ON THE CHEVROLET CARBURETTER. RIGHT: A CORNER OF THE TEST ROOM IN THE GENERAL MOTORS SCHOOL OF INSTRUCTION FOR GARAGE MECHANICS: NOTE THE G.E. AXLE STAND IN THE FOREGROUND.

A point worthy of note is that British made equipment and tools are specified throughout.

The course of instruction as at present constituted lasts a week, during which time the students have explained to them all the special features of Chevrolet chassis. Methods of dismantlement and assembly are demonstrated and the way to use the right equipment in the right way is an important feature of this part of the work. At the conclusion an examination is set, and those students who can show that their proficiency has reached a certain standard are granted a diploma. The instruction is free and the only expense to which those who attend are put is that necessarily involved by their being away from home.

At an early date the scope of this scheme of instruction is to be extended, a lecture hall being provided so that a more ambitious scheme of theoretical instruction can be added and provision is to be made for the making and display of cinematograph pictures to illustrate these lectures.

The course is not compulsory: it is impossible to make it so and perhaps not even necessary in the case of most agents who are likely to be only too glad to take advantage of it. Users themselves will find it to their own advantage to encourage the development of this scheme by suggestive enquiries of their own dealers as to whether their staff is attending. We expect in the near future to learn that many other makers are following this lead given by General Motors and the result can only be a considerable improvement in the status and efficiency of garage staffs generally, with consequent enhancement of the value of the service which those staffs render.

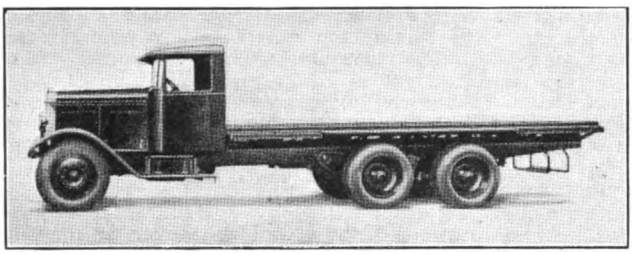
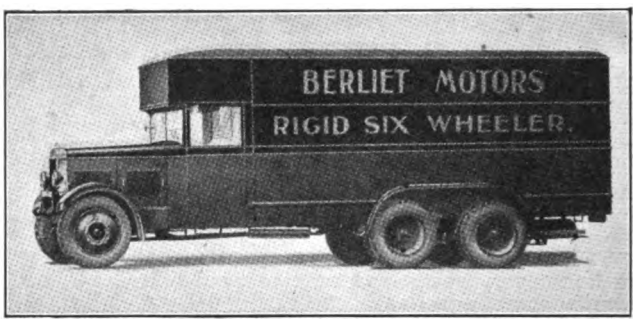
The New Berliet Six-Cylinder Rigid Six-Wheeler.

ONE of the latest additions to the range of vehicles placed on the British market by the Berliet Motor & Engineering Co., Ltd., Richmond Bridge Works, Twickenham, Middlesex, is a 10/12-ton rigid six-wheeler chassis.

The engine is known as type M.L.P.C., developing 45 h.p., R.A.C. rating. It has six cylinders cast in a pair of three, which are bolted to a cast iron crank-case. It has detachable heads. The bore is 110 .m.m., and the stroke 140. All valves are on one side of the engine, and operated by a single camshaft. Lubrication is by a submerged gear pump, driven by a skew gear from the camshaft, and supplies oil under pressure to the camshaft and main bearings, and throughout the drilled crankshaft to the big end bearings. The carburetter is a Zenith of special design. There is fitted the Berliet patent centrifugal speed governor which limits the maximum speed of the engine to 1,500 r.p.m. Magneto ignition is provided with variable advance. Water circulation is by centrifugal pump, and cooling is assisted by a four bladed fan. The engine is provided with three point suspension, having two arms at the rear, and a trunnion at the front.



THE BERLIET 10/12-TON RIGID SIX-WHEELER.



THE BERLIET 10/12-TON RIGID SIX-WHEELER WITH BOX VAN BODY.

Power is transmitted through a multiple plate clutch enclosed in a housing bolted to the engine crankcase, and supporting the gear and brake levers. The clutch plates are Ferodo lined.

From the clutch, power is transmitted through a universal jointed propeller shaft to the four speed gear box, the latter being of the sliding gear type with central change. The gear box is of cast iron, has three point suspension, and also carries the differential.

The countershaft carries at each end a chain sprocket, and power is transmitted from these sprockets to the front axle only of the bogie through a pair of heavy roller chains.

The springing of the rear bogie consists of one pair of semi-elliptic springs to each axle. The springs of the front axle of the bogie take both torque and drive, and the front ends of these springs are provided with means for chain adjustment. A similar provision is also made on the rear ends of the rear axle springs. Midway between the two axles, there are pendant brackets, one on each longitudinal frame member, and each bracket carries a rocker beam to which the ends of the springs are shackled.

The front springing, also, is by semi-elliptic springs. All wheels are steel disc, fitted with either 38 in. by 7 in. straight sided tyres, or 40 in. by 8 in. twins on both rear wheels. The foot brake is servo operated. A hub plate on the near side countershaft, controlled by the brake pedal, comes in contact with a second revolving plate supported on the gear box. The second plate winds up a chain coupled to the brake gear on all four bogie wheels. There is also a hand brake which operates on the driving wheels only.

The frame is a deep channel section pressed steel, substantially cross braced. The electrical equipment includes a 12 volt starting and lighting set, five lamps, dynamo and ammeter. The chassis lubrication is by grease gun throughout.

The dimensions are as follows:—Wheelbase, 16 ft. 4½ in.; front track, 6 ft. 3¼ in.; rear track, 5 ft. 8½ in.; overall length, 29 ft. 3½ in.; overall width, 7 ft. 6 in.; height of frame when loaded, 3 ft.; and dash to end of frame, 23 ft. 11¼ in. The chassis prices are, with 38 in. by 7 in. pneumatic tyres, £1,040; with 40 in. by 8 in. pneumatic tyres, £1,100.

Round the Lancashire Associations.

North Western C.M.U.A.

The Committee of the North Western division of the Commercial Motor Users' Association has had under consideration the first report of the Royal Commission on Transport, which was referred to the various areas for the purpose of formulating recommendations for submission to the national body. The meeting of the divisional committee was held in Manchester on October 30th, but it is understaood that time did not permit of the meeting considering the whole of the recommendaions submitted. The second report of the Royal Commission has also been referred to the area committees.

Institute of Transport.

At the opening session of the Manchester, Liverpool and District centre of the Institute of Transport, on October 25th, Mr. C. le M. Gosselin (H. Viney and Co., Ltd., Preston) read a paper on modern transport developments and problems. The meeting was held at Manchester. After reviewing recent records in air travel, Mr. Gosselin said the railways constituted the only branch of transport that was not competing for speed records. Concerning the speed limits suggested by the Royal Commission on Transport, Mr. Gosselin said he was not altogether convinced of their utility. They always made him think of congested thoroughfares where one saw the dear old traction engine having to do something like twenty miles an hour in order to avoid blocking the traffic. His view was that when one got speed limits the tendency was to apply and enforce them at the least dangerous points.

In the course of the discussion, Mr. R. C. Reynolds (Bleachers Association) said that while competition in the early stages of transport development led to efficiency, it inevitably reached a stage at which it became wasteful and at which co-operation had to be substituted.

Mr. R. W. Royle (traffic manager, C.W.S.) expressed the view that there ought to be closer co-ordination between rail and road transport.

Manchester Transport Owners' Association.

Now that questions relating to the licensing of motor coaches in Manchester have been settled, owners are considering plans for next season to prevent overlapping. At the meeting of the Motor Coach Section of the Manchester Transport (Owners') Association and C.M.U.A. joint organisation, on October 23rd, there was a long discussion on a scheme of co-ordination. Eventually a strong committee was appointed to investigate the scheme, also special sub-committees to go into questions relating to the provision of booking offices and the organisation of motor coach services to eliminate light running, etc. Although the scheme particularly applies to Manchester, where coach owners are required to have their vehicles licensed by the Corporation, all members of the Association may participate in it. Ninety per cent. of the coach owners in Manchester are members of the Association.

East Lancashire Associations.

The Commercial Motor Users' Association and East Lancashire Road Transport Association have written a letter to the Accrington Corporation on the running by the Corporation of omnibuses other than those outlined by the Accrington Corporation Act of 1928. The reply of the Corporation is that the omnibuses referred to had been running as alleged only when not required on other services, but as the local services developed, such running would probably be discontinued owing to the absorption of the vehicles in such services.

A New Karrier 30-Cwt. Chassis.

THE new 30-cwt. chassis produced by Karrier Motors, Ltd., Karrier Works, Huddersfield, represents the smallest of the Karrier goods-carrying range of vehicles. It is known as the "ZA" model, and is intended for a load of 30-cwts., not including the bodywork. It is a vehicle which has already proved highly satisfactory in actual service with important users, such as, for instance, the L. M. S. Railway Co. and Harrods, Ltd. The vehicle is of ample strength though of light and simple construction.

The engine is a four-cylinder monobloc casting with detachable heads, 80 mm. bore and 130 mm. stroke. It develops 19 h.p. at a normal speed of 1,000 r.p.m., whilst at maximum speed practically double this power is available. The bottom half of the crankcase is aluminium and forms an oil sump, holding 1½ gallons of oil. The crankshaft is of nickel steel, machined from the solid, heat treated and ground. The valves are placed side by side and have adjustable tappets, which are totally enclosed. Cooling is by a belt-driven impellor-type pump, forcing water through a gilled tube type radiator. Ignition is by high tension magneto driven through a Vernier coupling.

Lubrication is effected by a gear-type oil pump situated in the sump, gear driven from the camshaft. Oil is forced under pressure to the main bearings, and dippers on the connecting rods lubricate the big ends and cylinder walls by splash. The oil is efficiently filtered during its circulation. A relief valve maintains a constant pressure, and excess oil is discharged into the timing gear case before returning to the sump.

Power is transmitted through a single dry-plate fabric-faced clutch to the four-speed gear box, which is unit with the engine. The engine and gear box together are mounted on three-point suspension. The change speed gear has right-hand control on the gate principle and is independent of the frame. Gears are positively locked in position by spring-loaded plungers operating on selector rods. A reverse stop is also provided to the gear quadrant.

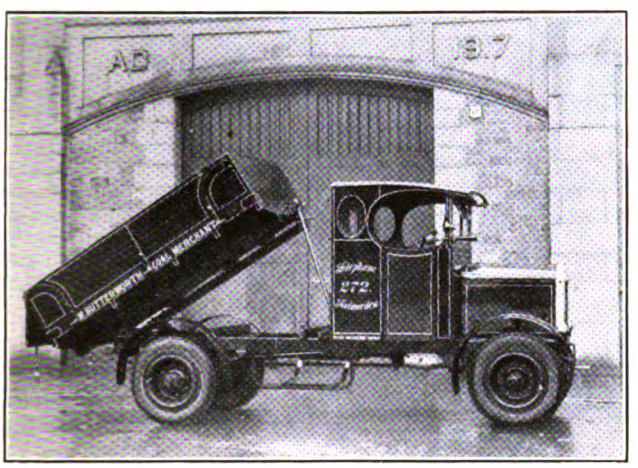
Between the gear box and the back axle there is a tubular driving shaft with a fabric disc at each end. The rear axle is of the worm-driven type designed that the worm, worm wheel and differential gear are easily removable as a single unit from the back axle casing. The road wheels are mounted on taper roller bearings and are equipped as standard with 32 in. by 6 in. pneumatic tyres. The wheels are of the detachable disc type.

The frame is pressed steel of deep channel section braced by steel cross members, and a special feature of the frame is that instead of the side members being parallel they are spread out to a width of 4 ft. at the rear, thus forming an excellent base for the body work. The lubrication of the chassis is on the grease gun system throughout.

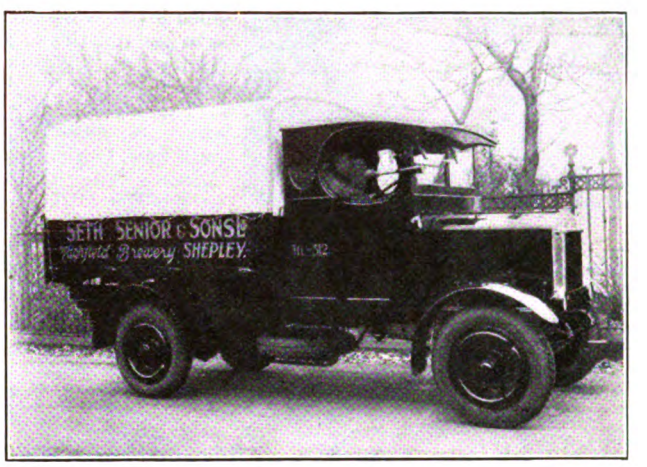
The hand brake is of the internal expanding type operating in rear wheel drums, and the foot brake is of the contracting type operating on the transmission. The wheel brakes are provided with bonded asbestos linings, and the transmission brake linings are of cast-iron and the design allows for quick detachability for renewal.

The petrol tank is carried on the dash and holds 11 gallons. The throttle and ignition levers are on the steering column. Steering is by worm and wheel and is fully enclosed.

The equipment includes a six-volt lighting set fitted as standard, and the dynamo is gear driven in tandem with the magneto. There are also a spare wheel, tyre and tube. Extras are a mechanical tyre pump, starter equipment and speedometer.



THE KARRIER "ZA" TYPE 30-CWT. CHASSIS FITTED WITH END TIPPING BODY FOR A YORKSHIRE COAL MERCHANT.



THE KARRIER "ZA" TYPE WITH TILT VAN BODY BUILT TO THE REQUIREMENTS OF A WELL-KNOWN YORKSHIRE BREWERY.

Road Vehicles—Great Britain.

A RETURN has been issued by the Ministry of Transport, giving particulars of the gross receipts from the taxation of Road Vehicles for the period from 1st December, 1928, to 31 August, 1929, and of the number of motor vehicles registered for the first time during the month of August, 1929. Copies (price 2s. 6d.) can be obtained from H.M. Stationery Office, Adastral House, Kingsway, W.C.2.

The gross amount received in payment for licences issued during the nine months ended 31st August, 1929, was £23,952,317, compared with £23,312,115 in the corresponding period of the previous year. The gross amount is subject to deductions in respect of rebates, refunds, statutory deductions, including costs of collection and administration and the proportion due to the Exchequer, under the Finance Act, 1926, from the net receipts of the taxation of motor cycles and vehicles taxed on horse-power.

Particulars are given of the total number of licences issued and surrendered during the nine months to the 31st August, 1929, and of the approximate numbers of licences current on that date. The total number of motor vehicles, excluding tramcars and trade licences, was approximately 2,131,000, compared with 1,996,000 in the corresponding period of the previous year.

The total number of mechanically-propelled road vehicles registered for the first time in August, 1929, was 19,073 compared with 18,164 in August, 1928.

British Passenger Agents' Association.

THE Annual Meetings of the British Passenger Agents' Association were held in London from October 11th to 15th last. Mr. A. C. Osborn, Curtiss & Sons, Ltd., Portsmouth, London, etc., occupied the Chair at the commencement of the proceedings as President, having occupied this position for the past two years. The Annual Report and Statement of Accounts having been adopted Mr. Osborn then proposed the election of Mr. Henry Courtier, of Scarborough, as the President for the ensuing year, and in doing so referred to him as a man of very wide experience in association work and also as a great traveller. Mr. John Frame seconded the proposal, which was carried unanimously. Mr. Courtier was then invested with the Presidential Chain of Office and took the Chair.

MR. HENRY COURTIER.

The Annual Luncheon of the Association was held in the King Edward VII Rooms at the Hotel Victoria on Monday, October 14th, the new President occupying the Chair, and the chief guest being the Rt. Hon. The Earl of Derby, K.G., President of the National Travel Association of Great Britain and Ireland. Other distinguished guests included Mr. Arthur Ponsonby, M.P., Parliamentary Under-Secretary of State for the Dominions and Chairman of the Overseas Settlement Committee, deputising for Miss Margaret Bondfield, Minister of Labour, who on medical advice was unable to be present; Sir Newton J. Moore, K.C.M.G., M.P., Major Frank Bustard, The White Star Line.

The Earl of Derby, proposing the toast of the British Passenger Agents' Association, said he was there as President of the National Travel Association of Great Britain and Ireland which was doing its best to second the efforts of the passenger agents in this country to deal with the increasing volume of business with people coming to this country. There were two reasons why he wanted to see the success of the new Travel Association—people coming to this country spent money here and he did not disguise the fact that he preferred money to be spent in this country rather than in other countries. He also wished to develop travel in this country from visitors abroad because the mixing of the peoples of the various nations of the world was a great factor in enabling the various nationalities to understand each other and so contribute to world peace.

Mr. Henry Courtier, President, in responding, said this was the twenty-fourth anniversary of the Association, and the membership was increasing and the finances satisfactory, thanks very largely to the untiring energy of the Hon. Secretary. The Association was formed, not merely for the mutual benefit of its members, but to encourage and support and co-operate with the Government Migration Offices, both at home and overseas, and the transportation companies. Dealing with the question of migration the lot of the agent was becoming more responsible every year.

The other toasts were "British Migration and Settlement," proposed by Sir Newton J. Moore and responded to by Mr. Arthur Ponsonby, M.P. "The Transportation Companies" and "The Guests."

The Luncheon was a very successful event and was attended by a very large gathering of members and friends.

A New Metallisation Process for Worn Parts.

THE process of building up worn parts of machinery by the deposition of metal is not new, but a new and improved method is claimed to have been developed by Metallisation (Sales), Ltd., 89 Upper Thames Street, London, E.C.4. This building up process is carried out by means of a pistol tool known as the "Metalayer." The metal to be deposited is in the form of a wire which is fed into the tool at the rear automatically from a reel through the nozzle and into contact with an oxy-acetylene flame which melts the wire and, in combination with compressed air, blows the atomised metal against the surface to be coated at the velocity of about 3,000 ft. per second. The metal as it impinges against the surface solidifies and becomes practically an integral part of the surface as neither hammering nor bending tests can separate it.

THE "METALAYER" IN ACTION.

The "Metalayer" is connected by rubber hose to acetylene and oxygen cylinders and also to a suitable supply of compressed air. The tool contains a compact wire feeding mechanism which is rotated by a small air turbine through suitable reduction gearing. The wire is pulled from the reel and fed through the nozzle at a rate of from 12 ft. to 24 ft. per minute, depending upon the kind of metal used.

The pistol weighs only 3½ lbs. The flow of the gas mixture and the compressed air is controlled by a lever at the side of the pistol, the pressures being regulated at the source of supply. The variety of applications for which the process may be used are almost endless. It is stated that it is possible to apply an exceptionally durable coating of any commercial metal upon any other metallic or non-metallic material, such as wood, stone, brick, glass, porcelain, concrete, leather and fabrics. The thickness of the coating may be varied according to requirements from .001 in. up. For coating worn steel parts such as gears, shafts, etc., nickel wire ordinarily would be used though it might be preferable to use iron wire or steel wire of low carbon content. The usual procedure is to enlarge the part beyond the required dimensions and finish it to size by machining. The process may be used for galvanizing for the protection of iron and steel, and the process has the advantage that work of any size can be treated in situ if necessary.

Aluminizing can be carried out in the same way and is being used for such parts as engine manifolds and exhaust pipes, super-heater tubes, case-hardening, annealing and cyanide pots, parts of electric furnaces, fires and cookers.

For spraying zinc, aluminium, copper, bronze, brass and nickel, wire one millimetre in diameter is employed, the diameter being increased to 1.5 millimetres in the case of tin, lead and zinc.

Manchester Docks and Ship Canal.*

By Henry Ashman Reed, M.Inst.C.E.,
Chief Engineer, Manchester Ship Canal.

MANCHESTER is the nearest sea port to towns as far apart as Burnley, Leeds, Nottingham, Leicester, Birmingham, Stoke and Crewe, and one is not therefore surprised that the idea that such an important industrial region required direct access to the sea was mooted some two centuries ago, and became a pressing necessity in the latter half of the 19th century, as the ports then available on the West Coast and at Hull and other ports on the East Coast did not afford adequate facilities, nor were they sufficiently adjacent to the population to afford an inlet and easy outlet for the large and growing volume of overseas trade.

An account of the Manchester Ship Canal would not be complete without special reference to that important undertaking, the Bridgewater Canal, the first Act for which was obtained in 1760 by the Duke of Bridgewater to carry coal from his collieries at Worsley to Manchester. Further Acts were obtained in 1762 to extend the Canal to Runcorn on the estuary of the Mersey, and in 1795 to Leigh in Lancashire. The total length of the Bridgewater Canal is 40 miles, and it is level throughout, with two flights of ten locks each down to the docks on the Mersey estuary at Runcorn.

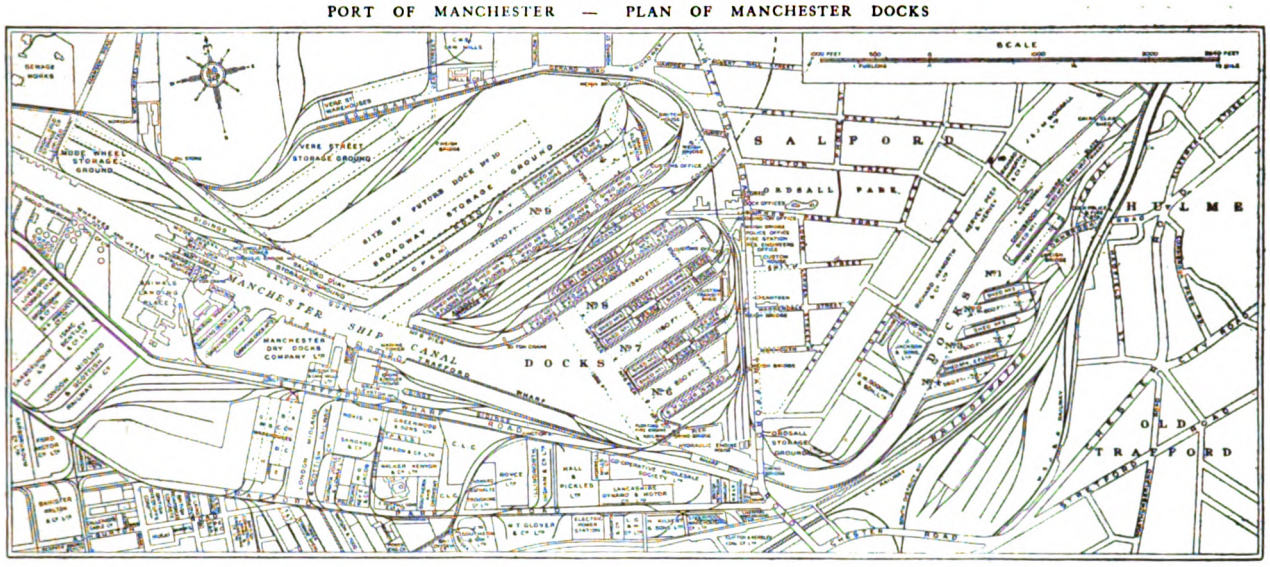
The Bridgewater canal was taken over in 1845 by a Trust, which absorbed the Mersey and Irwell Navigation, and which paid over half a million for the Navigation.

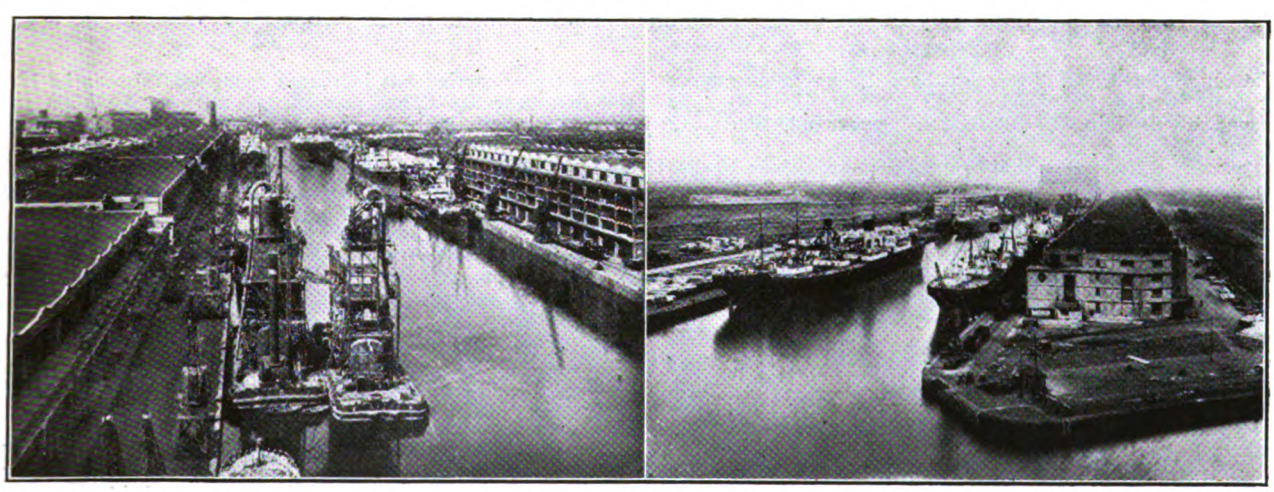
In 1872 a public company, the Bridgewater Navigation, was formed, which bought out the trust for £1,120,000. When the Manchester Ship Canal obtained their Act in 1885, Parliament stipulated that they should purchase the Bridgewater Navigation lock, stock and barrel, and pay £1,710,000 for the rights.

The Bridgewater Canal accommodated barges up to 70 feet long, 14 feet 9 inches beam and 4 feet 3 inches draught, carrying 72 tons; these barges plied from Manchester to Runcorn, and thence down the Mersey estuary to Liverpool, where the Trust used their own docks. The barges carried a large volume of traffic from the ships at Liverpool direct to Manchester by water, competing first with the roads and later with the railways.

Although by this means water-borne traffic reached the heart of Manchester, the importance of linking the city direct with the sea to avoid breaking bulk was not lost sight of.

PORT OF MANCHESTER — PLAN OF MANCHESTER DOCKS





TWO VIEWS OF THE SHIP CANAL DOCKS AT MANCHESTER.

In the meantime, the Mersey and Irwell Navigation was improved, and in 1841 the "Manchester Guardian" announced that a vessel had arrived in Manchester with a cargo of 300 tons of potatoes direct from Dublin and returned to that port with a cargo of coal.

In 1876 an engineer named Fulton proposed a ship canal to Manchester at sea level; this scheme again brought the matter prominently before the public, but was not adopted, and in 1882 Mr. Leader Williams (knighted after the completion of the work), who was then the engineer of the Weaver Navigation, brought forward his first scheme for a lock canal, and a committee of prominent citizens was

* A Paper read before the Annual Meeting of the Institution of Municipal and County Engineers, held at Buxton.

Digitized by Google

formed to promote a Bill which was launched in the Session of 1883. The first scheme, proposed by Mr. Leader Williams, was to train a channel in the estuary of the Mersey from Liverpool to Runcorn, with a lock canal thence to Manchester. This was strenuously opposed, and the final project, after three fights in Parliament, consisted of a lock canal commencing at Eastham on the Cheshire side of the estuary about six miles above Liverpool skirting round the estuary, and thence up the valleys of the Rivers Mersey and Irwell to Manchester.

The first sod was cut by Lord Egerton of Tatton, the chairman of the company, on November 11th, 1887, and the whole canal was opened to traffic on January 1st, 1894.

Having given some idea of the historical side of the project, the technical side now claims our attention.

The Canal is 35½ miles long, and for most of its length has a bottom width of 120 feet.

It was originally constructed with a depth of water of 26 feet, which was a bold forward stride in those days for an inland navigation, as the Suez Canal—a Canal between two oceans—was only 26 feet deep and 72 feet wide at the bottom at that time.

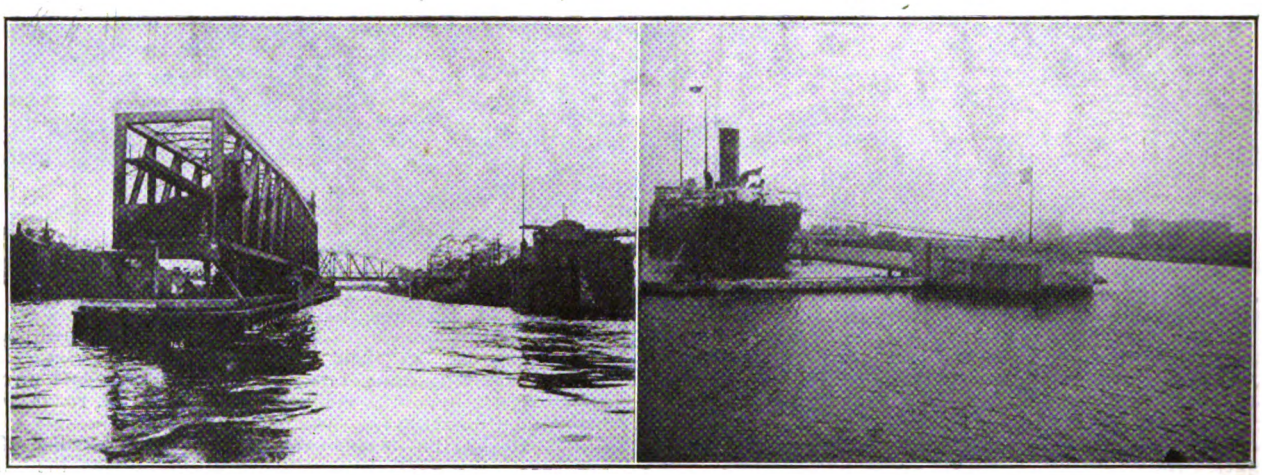
The depth was increased to 28 feet in 1909; on the Estuary or tidal section, 21 miles long, by raising the water level 2 feet, and on the Inland or the river section by deepening the bottom 2 feet.

All the locks are constructed of mass concrete with blue brick facing above the granite fender course and with granite coping; the gates are of greenheart, hydraulically worked as at Eastham; the locks are filled and emptied through culverts in the lock walls, the water is controlled in the culverts by means of greenheart sluice gates working between polished granite faces, and operated by hydraulic rams.

The operation of locking a vessel through takes, on an average, about ten minutes. It should be explained that there are two locks of different sizes at each installation, the smaller one taking the smaller traffic, thus conserving the water supply, which is further conserved by a second or intermediate set of gates in each lock for using a shorter length of lock if found sufficient for the size of vessel to be passed through.

Powerful pumping plant, capable of discharging 5,000,000 cubic feet of water in twenty-four hours, driven by Diesel type engines, is installed at three sets of locks in order to lift water to the pond above in case of shortage. There has, however, been ample water for the working of the Canal during the drought which has occurred this spring, and these pumps have not therefore been brought into requisition at all during this period.

The Canal accommodates most of the largest cargo steamers afloat, the biggest being 530 feet long by 63 feet beam, and about 12,000 tons carrying capacity.



LEFT: A VIEW OF THE BARTON AQUEDUCT WHICH CARRIES THE BRIDGWATER CANAL OVER THE SHIP CANAL. THE AQUEDUCT IS SHOWN OPEN FOR THE PASSAGE OF SHIPPING. RIGHT: TANKER DISCHARGING OIL AT THE STANLOW OIL DOCK. THE OIL PASSES UNDER THE CANAL TO THE STORAGE TANKS ON THE OPPOSITE BANK.

The length of Canal from Eastham Locks to Ellesmere Port and Stanlow Oil Dock, a distance of 4½ miles, was deepened by dredging to 30 feet, a further addition of 2 feet, in 1927.

As already stated, the Canal commences at Eastham Locks; from these locks a channel partly artificial and partly natural connects the locks with the deep water of the Mersey estuary. This channel is about 2½ miles long, it is buoyed and lighted by the Mersey Conservancy, and dredged by the Canal Company; heavy timber dolphins have been erected by the company for the guidance and protection of vessels on each side of the lock entrance channel.

The principal locks at Eastham are of two sizes, 600 feet long by 80 feet wide and 450 feet long by 50 feet wide. The gates are of greenheart, the lower gates of the 80 feet lock being the largest; each leaf weighs about 250 tons; they are moved by chains operated by hydraulic rams fixed in chambers in the lock walls.

An interesting provision at Eastham is an electrically driven sheer legs of 15 tons capacity for removing the top lengths of the funnels of steamers which are too tall to pass under the fixed bridges, the standard clearance being 75 feet above water level. Many modern steamers are provided with telescopic masts, and some with telescopic funnels for navigating the Ship Canal, but, to facilitate the passage of those steamers whose funnels are too high and are not telescopic, this machine has been installed to remove and store the funnels' tops during the time such steamers are in the Canal.

There are four other sets of locks to lift vessels to the level of the docks in Manchester, but of less width although of the same length; they are 600 feet by 65 feet and 450 feet by 45 feet respectively.

The total rise of the water level in the Canal is 58 feet 6 inches, the water at Manchester being about 70 feet above mean tide level.

The traffic carried has increased from 926,000 tons in 1894, the first year the Canal was opened, to over 6,000,000 tons in 1928, and the gross receipts from £97,901 to £1,517,018.

In constructing the Canal many engineering problems had to be solved, roads and railways had to be crossed, the existing canals and docks had to be dealt with, and drainage, flood and tidal water had to be provided for.

Roads are carried over the Canal by bridges, most of them of the opening span type with a waterway of 120 feet and road widths to suit the local circumstances. They are all worked hydraulically and turn on roller paths with a centre press to take a portion of the load.

There are seven bridges of this type, a good example being the Knutsford Road Bridge near Warrington, which weighs 1,350 tons. Two roads are carried over the Canal on high-level fixed bridges of the cantilever type, weighing 780 tons each with a clear headway of 75 feet above water level.

The problem of carrying the existing railways over the canal was a difficult one; they had to be lifted to give the standard clear head-way of 75 feet, and the bridges are all of the fixed lattice girder type. Five railways had to be dealt with, the largest bridge being that at Acton Grange carrying two railways side by side. The girders are 298 feet overall and the steelwork weighs 1,946 tons. The approach embankments entailed a very large amount of work, which included road diversions and bridges and the reconstruction of several stations.

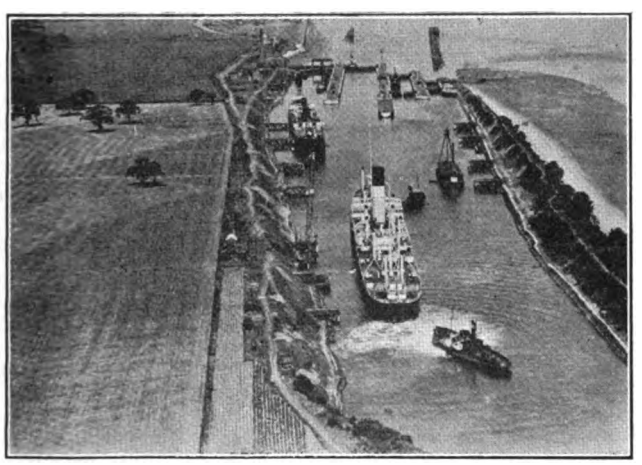
The Runcorn Viaduct, which carries the L.M. and S. Railway over the River Mersey at Runcorn, was constructed long before the Ship Canal, and gives a clear headway of 82 feet above normal water level in the Canal. The Widnes Transporter Bridge (now owned by the Widnes Corporation) carrying road traffic between Runcorn and Widnes, was constructed in 1905, and carries road vehicles across on a platform suspended from a carriage by means of steel ropes. The carriage is drawn across on the main girders by means

Digitized by Google

of rope haulage. The bridge clears both the Ship Canal and the River Mersey in one span of 1,000 feet.

At Ellesmere Port the Shropshire Union Canal ended in a series of docks bordering on the estuary of the Mersey which was cut off from the river by the Ship Canal and the traffic to and from this canal and the docks now passes over the Ship Canal. The docks have been leased to the Canal Company, and the port is fast becoming an important centre. Besides iron, steel, coal and general cargo a large volume of grain traffic is dealt with, there being three flour mills situated in direct water and rail connection with the docks. The Canal Company owns a large grain warehouse in connection with which a complete system of band conveyors has recently been installed to facilitate the discharge of grain cargoes and the passage of the grain in bulk direct to the mills.

The company have recently extended the quay accommodation at Ellesmere Port by constructing a reinforced concrete wharf 1,200 feet long, fronting the Ship Canal, equipped with modern wharf cranes, 2½ tons capacity, electrically driven. Road, railway and transit shed accommodation is provided on the wharf, and in addition an entirely new type of coaling plant for loading full cargoes by means of a pair of belt conveyors at a combined rate of 800 tons per hour or for bunkering. This plant is very adaptable, it will load into the hatches or bunkers of the largest type of ship which can enter the Canal, or alternatively into a barge or the bunkers of a tug. The conveyors move on radial tracks and can command all the fore and aft hatches of a vessel



EASTHAM DOCKS. THE ENTRANCE TO THE CANAL FROM THE MERSEY.

lying alongside. Railways and sidings with connections to the main line railways have been constructed at the rear to accommodate both coal and cargo.

At Western Point and Runcorn the docks of the Weaver Navigation and the Bridgewater Canal were cut off from the River Mersey by the Canal, and the Weaver Navigation and Bridgewater traffic now enters the Ship Canal and either passes along it and enters the estuary of the Mersey by means of side locks.

Perhaps one of the most interesting engineering feats in connection with the construction of the Ship Canal was the method of dealing with the Bridgewater Canal, where it formerly crossed the River Irwell at Barton by means of an aqueduct, the largest arch having 57 feet span. This has been replaced by a steel swing bridge which contains a trough for carrying the barge canal. The bridge revolves on steel roller paths. The ends of the bridge and the canal approaches are provided with gates which can be closed across the canal, the water enclosed in the trough on the bridge being thus cut off from the canal and moved with the bridge. A watertight joint is made between each end of the bridge and masonry of the approach aqueduct by means of steel taper "U" pieces with rubber faces. The bridge is worked by hydraulic power and with the enclosed water weighs 1,450 tons. The length is 195 feet with a clear waterway of 90 feet for the Ship Canal.

There is not time to describe in detail the various wharves and quays along the canal, of which there are many for dealing with coal, oil, ore and other cargoes, and we will now pass to the terminal docks at Manchester.

At Manchester there are 5½ miles of quays and a turning basin with dock sheds (many of which are five storeys in height) and all modern contrivances to deal with the various classes of cargo—Manchester being one of the best equipped ports in the world.

There are 53 hydraulic cranes, 53 steam cranes and 142 electric cranes for dealing with cargo, the principal type handling 30 cwt. and being capable of unloading cargo from the biggest ship and depositing it on the top floor of the five-storey transit sheds.

An interesting feature of these cranes is the Holme's remote control system whereby one man stationed at a convenient point on the ship can work the crane and at the same time observe the exact position of the load either in the ship's hold or ashore. This apparatus permits of a signaller being dispensed with, and at the same time ensures safer and quicker despatch.

The largest dock at Manchester is No. 9 Dock, and was opened in 1905. It is 2,700 feet long (over half a mile) by 250 feet wide, and has four-storey reinforced concrete transit sheds running continuously along one side.

On the other side at the head of the dock, are situated two of the most modern transit sheds; they are each 450 feet long by 110 feet wide, have five floors and are served by twelve 2-ton electric quay cranes on the quay side and six 2-ton and six 1-ton semi-portal electric cranes at the rear; railways are provided at front and rear with sidings for marshalling traffic, and cart roads are constructed all round the sheds. The dock railways are well laid out and connect with the railway systems of the country at three points; there are over 80 miles of railway and sidings at the docks; the Canal Company owns over 200 miles of railway in all, with 73 locomotives and 2,435 wagons.

Grain is accommodated and stored in two grain elevators, each of 40,000 tons capacity, the first for dealing with full cargoes by means of a bucket leg lifting 350 tons per hour, supplemented by pneumatic plant to lift 120 tons per hour. The second, situated at the head of No. 9 Dock, is fed by belts below the quays of the dock; these belts can be loaded from ships moored in the various berths at the same time as other cargo is being dealt with. There are six belts, each of 150 tons per hour capacity. The second elevator is worked electrically, has 341 bins, and can load inward from ships and outward to barge, rail or road simultaneously. Weighing is done by 12 automatic machines of 2-ton capacity, and automatic bag loading and weighing machines are provided for outward loading. Bulk loading to road vehicles is now being adopted in some cases as it saves the labour of sacking and handling.

Besides sheds on the quays for cargo in transit the Canal Company owns a large number of warehouses for the storage of merchandise; one of the principal warehouses is situated on Trafford Wharf Road, and covers an area of 6.4 acres. The building is divided into eight compartments for isolation in case of fire, and is protected by an automatic fire-sprinkling installation. The larger compartments are 400 feet long by 100 feet wide, and merchandise is handled by means of overhead cranes spanning the full width of the compartment.

At Manchester the company has provided a 60-ton self-propelling floating crane which carries heavy cargo on its deck and can range alongside steamers and load direct to them, thus avoiding delay to vessels which would otherwise have to move to a special berth for loading heavy merchandise.

An interesting vessel has been to Manchester on several occasions which has its own gear and specially designed holds to lift and carry locomotives, railway rolling stock, etc., completely built and equipped. The locomotives are sent by rail to the docks, loaded and unloaded by the vessel, and are ready for the road on arrival at the port of destination.

For many years large quantities of petroleum, lubricating and other oils have been imported by the Ship Canal, and all the important oil companies have tank installations on the borders of the canal with unloading wharves and oil pipe lines.

In order to meet the growing demand for petrol the Canal Company constructed an oil dock in 1922 at Stanlow, close to Ellesmere Port, to deal with petroleum products flashing below 73 deg. Fahrenheit, which it is not advisable—owing to fire risks—to unload at the usual open wharves. This dock is in an isolated position, and when a ship is discharging is closed by means of a reinforced concrete floating caisson, which in case of fire would prevent any burning petrol floating on the water from spreading over the surface of the canal and endangering the works of the company and passing vessels.

The Canal Company has provided a very complete installation of steam boilers (with fuel oil tanks, deep well, water storage tanks and water-softening plant) for supplying steam to ships when using the petrol dock at Stanlow, as the ship's boiler fires are out of action when unloading.

The petrol is pumped through pipes laid in a subway under the Ship Canal to the oil companies' storage tanks—from

Digitized by Google

whence it is distributed by road, rail and canal barge to the oil companies' various sub-depots and to petrol stations.

This business is growing and is a very valuable addition to the Canal Company's activities.

The maintenance and renewal of the Ship Canal works to keep the waterway, locks, roads, railways, bridges, buildings, rolling stock, machinery, etc., up to a proper standard of excellance requires a large staff and continual supervision.

The staff and workmen continually engaged number over 1,500, and the cost of maintenance and renewal amounts to about £340,000 annually. Of this sum £150,000 is spent on dredging, and £67,000 on the way, works and rolling stock of the railways.

The removal of the material deposited in the canal and approach channel necessitates constant dredging, the quantity removed each year amounting to upwards of 2½ million cubic yards, barge measurement.

Much of the deposit is brought down by the rivers (the canal drains an area of about 1,300 square miles), and in addition the tides bring in a large volume of silt from the Mersey Estuary.

The material is lifted by bucket, grab and suction dredgers, it is mainly deposited on large areas of land specially prepared by banking for the purpose, and is lifted from the barges by powerful suction pumps; a smaller proportion being taken out to sea and dumped.

In conclusion the author said he hoped that this short review would give some idea of the Manchester Ship Canal, which has grown from small beginnings to be the third port in the United Kingdom as regards value of imports and exports (London and Liverpool being the premier ports), and will help you to appreciate the magnitude of the undertaking, the pluck and foresight of the brave pioneers who conceived and carried out the work in the face of great engineering and financial difficulties, and the labour of those who have come after them, and who have added to and improved the original scheme in an endeavour to keep the undertaking always in advance of the requirements of the trade and commerce of the important area served by the Ship Canal.

British Association of Shipping and Forwarding Agents.

AT a meeting of the Council of the British Association of Shipping and Forwarding Agents, held at the London Chamber of Commerce on October 15th, the following gentlemen were present:—Chairman: Mr. A. W. Heard (Jones, Heard & Co., Ltd., Newport, Mon.); Vice-Chairmen: Mr. M. E. Duffett (J. D. Hewett & Co., Ltd., London); Mr. N. N. Bird (Herbert Watson & Co., Ltd., Manchester) and Mr. W. H. Elder (W. H. Elder & Co. (Shipping), Ltd., Hull); Messrs. A. Faulkner (Crowe and Co. (London), Ltd., Manchester); F. H. S. Rouse (American Express Co., Inc., London); J. O. Wood (T. F. Wood and Co., Ltd.); F. J. Gerson (Rosenberg, Loewe & Co., Succrs., Ltd.); W. O'Brien (G. W. Sheldon & Co., Ltd.) and F. W. Challis (temporary Acting Secretary).

Apologies for absence were received from Mr. T. Heyman (Morison, Pollexfen & Blair), Mr. MacCulloch (McCulloch, McLellan & Pollok), and Mr. Sanderson (Sanderson's Express Co., Ltd.).

Correspondence.—(a) A letter from a member gave rise to some discussion on the subject of Through Bills of Lading issued by Forwarding Agents being refused by banks. It was stated that the London Shipping and Forwarding Agents' Conference has consistently supported the Forwarding Agents' point of view and that the British Association of Shipping and Forwarding Agents were watching the matter with close interest.

(b) A letter was read from the International Federation of Forwarding Organisations, stating that they were unable to accept the Association's invitation to meet in London in 1931, but that they would like to consider an invitation for 1932. It was decided that this invitation should be given in due course.

Federation of British Industries.—From correspondence with the Federation of British Industries it appeared that they supply their members with quotations obtained from Shipping and Forwarding Agents who are also members of the Federation. It was decided that a further letter on the subject should be addressed to the Federation suggesting co-operation with the Association.

Railway Competition.—Deputations have been received on behalf of the Association by the London, Midland and Scottish Railway and the Great Western Railway. Both companies have given assurances that they have no wish to interfere with, or in any way injure the business of Forwarding Agents.

Local Areas—Hull.—At the request of the Humber Forwarding Agents' Association, it was decided to address a letter to the General Managers of the L.N.E.R. and the L.M.S., drawing attention to the state of affairs which exists at the Humber Ports where the work of Forwarding Agents appears to be done by the railway companies, free of charge.

Proposed Affiliation.—It was reported that the London Shipping and Forwarding Agents' Conference was considering a scheme for affiliation with the British Association of Shipping and Forwarding Agents, and Mr. Duffett and Mr. Rouse explained the suggested basis of this affiliation, which was well received by the meeting. It is proposed that London Forwarding Agents should, upon payment of a subscription of four guineas per annum, become members of both the London Conference and the British Association of Shipping and Forwarding Agents, each Association receiving 2 guineas in respect of each member. It is recognised that some London Agents may wish to join only the national body by paying the present subscription of 3 guineas. Such Agents would thus receive the benefits of the activities of the London Conference without being members of it. Those present were of the opinion that this difficulty could be overcome by the British Association of Shipping and Forwarding Agents' raising their subscription for London members to 4 guineas per annum, and the members present unanimously decided that this suggestion should be placed on the Agenda of the next Annual General Meeting of the Association.

Membership.—An application for membership was accepted from the Machinery and Technical Transport Co., Ltd. Recommendation from the German section of the London Shipping and Forwarding Agents' Conference: On the recommendation of the German Section of the London Conference, it was decided to send a circular to members ponting out that as some misunderstanding has, on occasion, arisen, concerning the interpretation of the phrase "per ton" in quotations made in respect of goods originating from Continental towns, they should make it quite clear that all quotations for goods from Germany should be "per thousand kilos" and that no reference should be made to the phrase "per ton."

Southampton Docks.

MARKED activity is always apparent in the general export trade at the Docks during the autumn months. This big seasonal "spurt" is mainly due to the great quantities of Christmas traffic for shipment overseas. In order to reach destinations in farthermost parts of the world at early dates, this traffic commences to pass through late in August, and this year the new freight services of the Peninsular & Orient Steam Navigation Company have given an additional stimulus to the shipments. Heavy South African cargoes are prominent features in this traffic each year during October and November, but recently the Union-Castle Company's m.v. "Carnarvon Castle" eclipsed all records with a cargo of over 7,000 tons. Further dredging and widening of the main channel approach to Southampton Docks is being undertaken by the James Dedging, Towage and Transport Co., following upon the acceptance by the Southampton Harbour Board of that Company's tender for this work. The contract entails the provision of a depth of water of 35 feet 6 in. at L.W.O.S.T. between the Hook Buoy and Calshot Light Float and also a widening of the approach to the Docks from these points to 600 feet. The New Zealand meat season, recently terminated, has been most successful as far as the cargoes handled at Southampton were concerned. Both the New Zealand Shipping Company and the Shaw, Savill and Albion Line have been responsible for the large consignments landed at the Docks which this year have established a new record for the trade. Winter schedules are now being entered upon by most of the shipping companies, and the joint mail service operated by the Cunard and White Star Lines comes into being with the sailing of the "Majestic" on Wednesday, 27th November. This curtailed schedule coincides with the overhaul season for the big liners, and between November and March next each of the "big six" will be accommodated for this purpose at Southampton, commencing with the Cunard liner "Aquitania."

The Transoceanic Forwarding Co., Ltd.

VISITING the offices of the Transoceanic Forwarding Co., Ltd., 61 Greek Street, Soho Square, W.1., we were interested to find that this progressive shipping and forwarding agency is housed in the same building where De Quincey wrote his story of "The Confessions of an Opium Eater."

There is very little of the romance of De Quincey left in this busy office, where the firm originally commenced business soon after the War, with Mr. A. B. Chalmers and Mr. C. E. Kuderli as the controlling principals. They have now a staff of tweny-three employees at the head office.

The Company has maintained a good reputation for doing more than just the ordinary Custom House clearances and forwarding work.

MR. ANDREW B. CHALMERS, DIRECTOR.

They have, through their directors, kept themselves deeply interested in the requirements of their clients, and have always considered the clients' requirements and worked to their schedule.

After the business had been established in London for twelve months, it became obvious that owing to the important continental connections which the directors had established through their twenty years of forwarding work, that they must have their own organisation in Paris, where up-to-date shipping agents' methods could be placed at the disposal of their clients, and at the same time, give their clients who were journeying from England, America, Germany, etc., an office where they could speak their own language, and be given every assistance during their stay in France. To this end an office was opened at 203 Rue du Faubourg St. Denis, Paris, which is within three minutes walk of the Gare du Nord, under the management of Mr. Jean Frei, who had already, after experience in Switzerland and in France, been several years in London with a well-known firm of forwarding agents, and consequently, clients calling upon the Paris office, have the benefit of being able to speak their own language, and be clearly understood by the staff. This office has been nearly ten years in existence, and it has recently been necessary to also occupy 201 Rue du Faubourg St. Denis.

The firm also keep in touch with the requirements of their clients, not only in Paris, but in America, Belgium, Italy, Germany, Austria and Czechoslovakia, with the result that the name of the Transoceanic Forwarding Co., Ltd., is well-known in the chief cities of Europe and America.

The Paris office, as well as the London office, can boast of having been guided by the same Direction, during the past ten years, which means that the clients visiting either of these two cities, receive the greatest consideration from the Direction and from the staff of eighteen employees.

The Company also four years ago, found it necessary, in order to give a proper representation, to open an office in Brussels and in Antwerp, where they are now firmly established with a progressive business.

They also handle correspondence in German, French, English and Flemish, and any clients calling have no difficulty in expressing themselves and their requirements, and they always receive the most careful attention from their Administrateur-Délégué, Mr. F. Van de Moortel and the staff of sixteen employees.

MR. C. E. KUDERLI, DIRECTOR.

An organisation has also been formed in Berlin, of which the Directors of the Transoceanic Forwarding Co., Ltd., are the sole shareholders, entitled The Transoceanic Forwarding G. m. b. H., Friedrichstrasse 232, Berlin, SW, 48, and here the reputation of the Transoceanic Forwarding Co., Ltd., is well carried on by their two Directors, Mr. Distler and Mr. Gaulis, and a staff of 14 employees.

At this office a writing room is placed at the disposal of clients, with free use of telephone, and also every assistance to enable them to conduct their business while in Germany.

The Transoceanic Forwarding Co., Ltd., are recognised for getting things done, and a glance through the Record Book of this Company, gives one a very good idea of the efficiency of their organisation. Letters which have been written by the various clients, are couched in the most friendly terms, and show that although the Company has only been in existence for ten years, it has made a lasting impression on very important concerns throughout the World.

Although a great portion of their business is in connection with Europe and America, the Directors have had many years experience in shipping to the Colonies, and are well-known in Australia, New Zealand, India, China and Japan, and clients can feel sure that their requirements will be handled with British efficiency, both in this country and at their various Continental offices.

River Severn Development Association.

THE River Severn Development Association has been formed to develop commercially the area through which the River Severn flows. This great waterway of the Midlands offers economical transport from the Bristol Channel Ports, the river being within easy reach of the Midland manufacturing area. The Severn is navigable to Worcester for boats up to 200 tons burthen and to Stourport for boats up to 100 tons burthen. At a small private meeting representing various towns and interests connected with the River Severn, it was decided to set up the River Severn Development Association, with offices in Birmingham. The work of the Association will be divided into three groups:—1. To promote the development of the River Severn and the neighbourhood thereof for industrial purposes; 2. To collect information on all matters of interest to industry; and 3. To advertise the advantages of the River Severn more particularly from an industrial point of view. It is proposed in the first instance to set up a Central Bureau from which information relating to factory sites, warehouse accommodation, availability of electricity supply, gas, coal and oil fuel, local rates, transport facilities, labour supplies, etc., may be obtained. The aim of the Association is to develop as far as possible the whole of the area served by the River Severn and not to concentrate on any one particular locality. Information and data to this end, therefore, will be collected from all the Authorities along its route. For the time being it is proposed that Mr. E. W. Bayliss, of The Severn and Canal Carrying Company, Ltd., 16, Bridge Street, Broad Street, Birmingham, shall act as Secretary.

Port of London Authority.

THE new motor ship "Rangitata" has arrived in the Royal Albert Dock, London, from the Clyde where she was built by J. Brown & Co., Ltd. The vessel possesses several special features. By a special arrangement of bulkheads, the vessel has one load-line only for both summer and winter seasons instead of two as is usual. The twelve lifeboats are fitted and mechanically propelled, and all winches and auxiliary deck gear are operated by electricity. The "Rangitata" is 16,737 net reg. tons, and she has accommodation for 110 first class, 90 second class and 200 third class passengers. Besides general cargo, the vessel will carry perishable goods for which she has about 450,000 cubic feet insulated space. The "Rangitata" will leave London on her maiden voyage on November 21st for Wellington, New Zealand, via Panama.

The Port of London Authority has accepted the offer of Mr. J. Lawson, a Director of the well-known firm of merchants, Messrs. Balfour, Williamson & Co., to instal in the docks six drinking water fountains for the convenience of dock workers.

To facilitate the movement of shipping in the Upper Pool, the Port of London Authority has come to an arrangement with the Commissioners of Customs and Excise and the Shipowners concerned, whereby the Customs examination of vessels bound from foreign ports to wharves above London Bridge will take place as far as possible in the lower reaches of the Thames instead of in the Upper Pool as formerly.

The Port of London Authority has arranged for the exhibition throughout South Africa of a film depicting the activities and commercial attractions of the Port of London. The arrangement has been made through the Authority's South African representative, Mr. E. J. Hartley, whose headquarters are in Cape Town.

The increase in London's shipping which has been taking place for some years still shows progress. The figures for the half year ended 30th September last, indicate that the current twelve months will break even the record for the previous twelve months, as a further increase of 1,826,314 net register tons has taken place over the corresponding six months of last year. No other port in the United Kingdom approaches the London figures. Last year over 55,000,000 net register tons entered and left London, being over 61 per cent. in excess of the next largest port. The shipping which entered the docks of the Port of London Authority for the month of September was 1,529,485 net register tons, a record for any single month in the history of the docks. Although shipping figures are not always a reliable index to trade, the goods landed and warehoused with the Authority show an increase of 6 per cent. over the corresponding six months of last year.

The extent of the trade between London and the United States and Canada (North American Ports), is indicated by the presence simultaneously in the London Docks recently, of 17 ships from these ports. The vessels included six well-known Atlantic passenger and freight ships—the White Star "Calgaric" and "Megantic," the Cunard "Alaunia," "Ausonia" and "Lancastria," and the A.T.L. "Minnekahda," representing 167,170 net register tons.

An exhibition of Arts and Crafts executed by members of the staff of the Port of London Authority, will be held at the Authority's Head Office from November 25th to the 30th. There will be a wide range of exhibits and most grades of the staff will be represented. The exhibition will be open to the public each day, and it is anticipated that the various displays will be quite as attractive to the public as last year's inaugural effort.

During the week ended November 1st, 572 vessels, representing 348,756 net reg. tons entered and left the Port of London. Of these 321 ships (219,949 net reg. tons) were engaged in foreign trade and 251 (128,807 net reg. tons) were engaged on coastwise trade. Compared with the previous week the vessels which used the Port Authority's docks show an increase of 49 ships representing 77,341 net reg. tons.

India is taking large consignments of British goods at the present and London Shipowners are finding no difficulty in filling all available cargo space in their vessels sailing for Indian ports.

New Liners for America.—Shipbuilders of the United States have been invited to submit tenders to the United States Lines for the construction of two liners each of 705 feet long, of approximately 30,000 tons displacement and capable of 22 knots speed. The ships, which are to be able to carry 1,300 passengers, will be smaller than the "Leviathan" but will be larger than any so far constructed in American shipyards. Specifications are also being prepared for four other liners, larger and faster than the "Leviathan," which the United States Lines intend to build after the first two have been completed.

Insulated Containers for Goods.

THE introduction by the L.M.S. Compa containers to cater for meat and oth traffic marks the further stage in the container form of goods traffic by that the pioneers in the scheme in this resp ago.

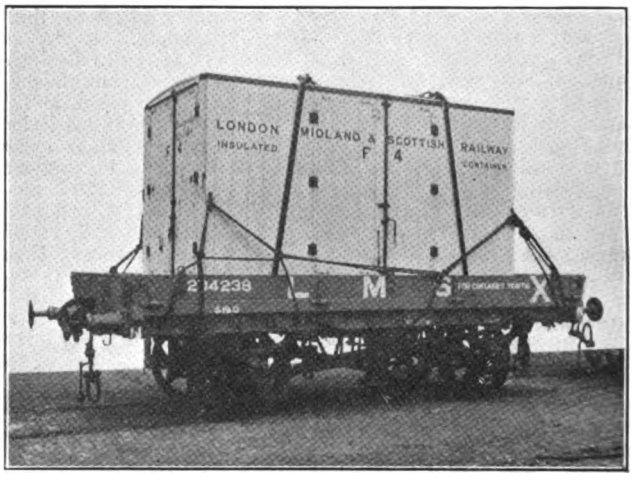
The insulated containers, the first bat in traffic, are distinguished as "F" type 6 ft. 2 in. wide, and 6 ft. 4 in. high in and are constructed of wood painted w interior being varnished to facilitate cleans.

The container is fitted with a pair of swin outward at either side and also with a door upper half of which swings outward, the l opening in the form of a truck door.

Insulation is provided by means of 2 in. of slabbed cork, and has been pronounced by the trade to be efficient.

An improvement, however, will be effected in the next batch of containers to be delivered by having somewhat less insulated material in the floor in order to increase that in the roof upon which the greatest amount of heat from the sun will fall in hot weather.

The containers are rendered securely air-tight by ingenious devices whereby a spring inserted between the inside wood



LONDON, MIDLAND AND SCOTTISH RAILWAY INSULATED CONTAINER.

of the insulated material where the doors occur is employed to force a leather flap tightly into the interstice of the door when closed.

Lifting arrangements are provided by slings connected by four lifting chains to the roof and the container, which are designed to carry 4 tons, will weigh empty 35 cwts., and will travel on suitable railway wagons equipped to run on fast goods trains.

Although no hangers are provided for the purpose of handling meat, the facility is a considerable improvement upon railway refrigerator cars in as much as all handling at the station is eliminated, the meat remaining in a cold atmosphere until delivered to shops, store or cold store, and as compared with road transport, the rail container facility should be superior in its elimination of bruising.

The L.M.S. innovation has commended itself to experts of the meat trade who have had the opportunity of inspecting it.

The Freezing of the St. Lawrence.—It is officially announced that the navigation of the St. Lawrence will cease on November 23rd, when lights and other Government aids to navigation will be discontinued. The last sailing between Montreal and Quebec will be on the same date.

Direct Shipping Line Between Buenos Aires and Vera Cruz.—A Buenos Aires message says that as a result of conferences between President Irigoyen, Dr. Oyhanarte, the Minister of Foreign Affairs, and the Mexican Ambassador, Senor Reyes, a direct shipping line between Buenos Aires and Vera Cruz has been established. The Argentine ships "Bahia Blanca" and "America" will take the first cargoes.

Co-oper... -To consider amongst other things the important question of shipping customs, the Liverpool Shipping and Forwarding Agents' Association is working in close co-operation with the London Association and with the New York Freight Forwarders' and Brokers' Association. The matters which are within the immediate purview of these bodies collectively, are of great significance, nationally, indeed almost internationally.

Master Porterage Point.—Liverpool shipping and forwarding agents have been advised on a point in reference to the master porters rates for East Indian palm oil. The Dock Labour Joint Committee gave a ruling that no extra wages are payable under the White Book Agreement to dock labourers handling East Indian palm oil unless in any specific case a claim that the barrels are in dirty condition can be established. Hence, the Mersey Docks and Harbour Board has directed that the description of "Oil, Palm" in the list of articles on page 21 of the Master Porterage Bye-laws be altered to read "Oil, Palm" (other than East Indian and Palm Oil in Iron Drums or Cylinders). If, in any specific case, a claim that the barrels are in dirty condition is established, the master porter will be entitled to add to the rates shown in the classification tables, an extra charge of 1d. per ton for every extra 6d. per day paid for labour.

Problem of Port Cargoes.—There is a certain amount of agitation in Liverpool commercial circles in consequence of the extension made by the Manchester Ship Canal Company in regard to ships dues on vessels discharging part cargoes at Manchester. Vessels discharging not more than one-half of their net registered tonnage pay only half of the ship canal dues. At Liverpool, however, ships discharging not more than one tenth of their net registered tonnage pay one-half tonnage dues plus tonnage dues on the cargo landed. Colonel Hawkins (assistant general manager of the Dock Board) has stated that the question would be considered by the Board when the de-rating proposals came before them. The Board had not yet decided what they would do in the way of benefits under de-rating, and the question of the discharging of part cargoes would probably be considered again. The board, he said, always had been quite firm on this particular point. They want the ships with full cargoes at Liverpool.

The Late Mr. H. Ackerley. — Mr. Harold Ackerley, of Birkenhead, who passed away last month in his sixty-sixth year, was a member of the firm of Messrs. Benjamin Ackerley and Son, shipping and passenger agents of the Dock Board Building, Liverpool, which was founded by his father, the late Mr. Benjamin Ackerley in 1849. The firm are agents for several North and South American shipping companies. At the funeral many firms of shipping and forwarding agents were represented including:—Mr. G. C. Horton (chairman, Liverpool Shipping and Forwarding Agents' Association), Mr. Stanley Hooton, Mr. John Philip, Mr. T. N. Philip, Mr. J. Delamere (R. Steinmann and Co.), Mr. G. V. Horton (director, E. H. Mundy and Co., Ltd.), Mr. F. B. Johnson (Robt. Gilchrist and Co., Liverpool), and Mr. W. R. Wild (Langstaff, Erembert and Co., Liverpool).

Revised Porterage Conditions.—No objections having been received by the Ministry of Transport to the proposed amendment of the Liverpool master porters rates for opening and taring packages containing gum, gum ghatty and glue, the amended bye-law is now in operation. The new master porters rates on Premier Jus and stearine in tierces or casks, not exceeding ten cwts. each, are now in operation. The new rate is 30d. per ton, including weighing singly, for delivery after the goods has been stowed on the quay.

Manchester Area.

Manchester Shipping Agents' Conference.—All the business at last month's meeting of the Manchester Shipping and Forwarding Agents' Conference was of a domestic nature that does not lend itself to public discussion. One topic, however, that is of constant recurrence is the apathetic attitude of many shipping and forwarding agents to the value of efficient organisation. There is a tendency for many to under-estimate what might be done by collective effort. As it is, many firms shoulder their own burdens which might be correspondingly lightened were they borne by a greater number. In an interview the other day, Mr. Allen, who is the secretary of the Manchester Conference, said it is their ambition to conduct the Conference on the lines of the London Shipping and Forwarding Agents' Conference and, as soon as the necessary support is forthcoming, to form separate sections for agents according to their interests, such as in the French trade, German trade, South American, etc. This, of course, will enable specialised attention to be given to sectional problems. How soon it will be possible to translate that idea into fact depends upon the readiness with which agents respond to the Association's appeal.

New Rate for Grain.—The Manchester Ship Canal Company has reduced the toll on grain at Manchester docks from 6s. 3d. to 5s. 3d. per ton. The new schedule of revised through rates, including the Ship Canal Toll, is also now in operation.

Change of Address.—It should be noted that the address of the Manchester Association of Importers and Exporters is now Ship Canal House, King Street, Manchester.

Honour for Shipper.—Mr. R. Noton Barclay last month received a requisition signed by all the members of the Manchester City Council asking him to be the next Lord Mayor of the City. Mr. Robert Noton Barclay is principal of the firm of Robert Barclay and Co., of 35, Whitworth Street West, Manchester, shippers and exporters of cotton goods to South America and India, a business founded by his father in 1860. As a director of the Manchester Chamber of Commerce, Mr. Barclay has rendered great service to industry. He was president of the Chamber in 1914-16.

Ship Canal Traffic.—From the Manchester Ship Canal Company we have received the traffic statistics applying to the month of September. These are again satisfactory and indicate a slight increase in traffic over September, 1928, the respective figures being:—£106,107 and £105,086. In the first nine months the revenue from traffic using the canal was £1,079,808, compared with £1,058,962 for a similar period last year. Thus there is a balance of £20,846 on the right side. Manchester traders have been showing considerable enthusiasm for the cause of developing more ship canal traffic, particularly in the direction of direct shipments to and from Manchester.

Tyne and Tees Area.

Steamship Acquisition.—The Free Trade Wharf Co., Limited, of London, of which Sir Arthur M. Sutherland, Bart., is chairman, has by an exchange of interests, acquired the cargo services of the Bulk Oil Steamship Co., Ltd., of London and Hull, whereby the Free Trade Wharf Company take over the steamers "Hull Trader" and "London Trader." These vessels will continue running a bi-weekly service between London and Hull and Grimsby. In future the "Hull Trader" and "London Trader" will load and discharge in London at the Free Trade Wharf. Mr. Fred Whittock will act as manager of the new adjunct to the enterprises of the Tyne-Tees Steam Shipping Co., Ltd., whose headquarters are in King Street, Newcastle.

Tyne-Thames Trade.—That the general cargo trade between the Thames and the Tyne is on the upward grade is evident from the fact that the Tyne-Tees Steam Shipping Co., Ltd., is increasing its cargo steamship service between London and Newcastle to three steamers weekly as from November 14th.

A Fine Model.—The Tyne Improvement Commission's fine model of the Tyne is to be shown at the Antwerp International Exhibition. It drew thousands of visitors at the North-East Coast Exhibition, which closed on October 26th.

Digitized by Google

Linking-up Two Shields.—The Councils of South Shields and Tynemouth are contributing equally to pay experts a fee of 750 guineas to report on the best means of linking the two Boroughs, across or under the Tyne.

New Staiths.—With the completion of the new staiths erected by Pelaw Main Collieries, Ltd., at Pelaw Main, Tyne shipments of coal are likely to increase further.

Humber Area.

Port Improvements. — The London & North Eastern Railway Company have announced that the coal-shipping appliances at Hull are to be adapted for dealing with 20-ton wagons. This is in accordance with their general practice of adopting high-capacity wagons wherever these vehicles can be usefully used. The King George Dock is already capable of dealing with large wagons, and the decision to bring the other docks into line gives great satisfaction to the coal exporters. Mr. S. Little, the Chairman of the Humber Coal Exporters' Association, welcomes it, but is not altogether satisfied. He would like the erection of additional coal hoists at the King George Dock, the foundations of which, he points out, were put in long ago. The money to be spent on this work is Hull's share of the capitalisation of the remitted passenger duty. Grimsby is to have about £100,000 spent on the reconstructing and modernising transit sheds and the introduction of electric cranes. Sir Ralph Wedgwood, the General Manager of the Company, spoke at Hull during Empire and Civic Week. He was very complimentary about the enterprise of the port, and indulged in some good-natured comments on the many demands made for dock and railway improvements, but was careful not to commit himself in any way. If the alteration of the coal shipping appliances is all the company are going to do for Hull in the way of capital expenditure, there will be much disappointment, although the estimated cost is stated to be £140,000.

South Wales Area.

Brisk Swansea Shipments.—According to a letter to the Swansea Chamber of Commerce from Mr. C. S. Page, chief docks manager of the Great Western Railway Company, 94,000 tons of coal were shipped at Swansea by the Company's docks appliance, and this total for one recent week, if maintained for a twelve month period would give coal shipment of 4,900,000 tons, considerably in excess, states Mr. Page, of 1913, peak year coal shipments from Swansea. Mr. Page states that the facilities position is always under review, and at the present time, notwithstanding the adequate facilities at Swansea, the Company has under consideration proposals for improving coal shipment facilities at the port.

Record Month. — October proved a record shipments month for coal at Swansea. In one week, ending October 26th, 102,173 tons were loaded. To some extent this was due to the rush of shipping to conclude the Canadian coal shipping season, the St. Lawrence River being unnavigable from mid-November until Spring.

Remarkable Tribute to Mr. J. H. Swallow.—Councillor J. H. Swallow, Newport, who recently was appointed deputy-chief docks manager to the Great Western Railway Company, was recipient, on October 26th, at a remarkable presentation meeting held at King's Head Hotel, Newport. He was presented by 1,325 workers at the Newport docks, with a silver salver and silver rose bowl as a token of affection and esteem. The presentation meeting was attended by representatives of all classes of docks workers and was notable in that the trimmers, who have always declined to be associated with presentations, on this occasion waived objection and heartily joined in. Mr. J. T. Edmunds presided, having support of, amongst others, Mr. H. B. Smith, Newport Docks manager, Mr. W. Cleaver, divisional engineer, Capt. F. W. Cutcliffe, dock master, Mr. H. Llanfear, yard master, Mr. W. Duncan, mechanical engineers' department, Mr. R. H. Rice, staff clerk and honorary secretary to the presentation committee, Mr. Geo. Scott (Scott & Co., stevedores, etc.), Capt. Cutcliffe made the presentation, and said that the occasion marked a milestone in a successful career. Responding, Mr. Swallow said he was grateful to all for the kindly sentiments, and particularly to the trimmers for having associated themselves with it.

Obituary.—Great sympathy is expressed in dock circles with the surviving relatives of Mr. E. Franklin Thomas (head of Franklin Thomas & Co., coal exporters, pitwood importers and shipbrokers, Cardiff), who died, aged 75 years, in London, on October 26th. He was a former president of Cardiff Chamber of Commerce, was five times Vice-President, and in 1921 and 1922 was Chairman of the Coal Exporters Federation of Great Britain; and to the time of his death, was the Federation's representative at the Ministry of Mines. He was an ex-Chairman of the statistical Committee of the International Chambers of Commerce, and was Vice-Chairman of the British Section. The business of Franklin Thomas & Co., is managed, and has been since 1924, by Mr. D. Rupert Phillips, son-in-law of the late Mr. Franklin Thomas.

Llanelly Harbour Improvements.—Mr. H. W. Spowart, clerk to the Llanelly Harbour Commissioners report that negotiations are progressing with the Government for the proposed Llanelly Harbour improvements grant, which, if obtained, will assist in greatly increasing facilities and the trading capacity of the port.

Newport-Midlands Trade Development.—In connection with the efforts being made to encourage Newport use by Midlands centres as a port base and distributing centre, both for import and export purposes, a deputation comprising Alderman John Moxon, O.B.E., chairman, Newport Corporation Parliamentary Committee, Mr. Ivor Smith, President of the Newport Chamber of Commerce, and chairman of the Joint Transport Committee, Mr. W. Mordey, member of the Joint Transport Committee, and Mr. J. R. Stephens, secretary to the Committee and also of the Development Association, have waited on the Chief Goods Manager, Great Western Railway Company, anent Newport-Midlands railway rates. The deputation's point was that as Newport is twelve miles nearer the Midlands than Cardiff there should be a differential rate in favour of Newport. In support of this the case of Liverpool, only seven miles nearer Midlands than Newport, was cited for a lower rate is allowed to Liverpool. Other matters of interest to Newport were also discussed. The Company's answer is to be announced later.

Irish Ports.

Belfast Harbour. — In connection with the proposed construction of a new dock for the County Antrim side of Belfast Harbour, the Belfast Corporation has decided, subject to statutory authority being obtained, to agree to the proposal of the Harbour Committee to construct 700 feet of tramway line at Duncrue Street. At a meeting of the Belfast Harbour Board, the Harbour Master reported that the total tonnage which arrived at the port of Belfast from 1st January to 28th September last, was 2,433,563, which showed an increase of 205,117 tons compared with the first nine months of 1928. Of this year's increased tonnage 194,359 was an increase in cross-channel and coastwise, 10,539 in foreign tonnage, and 219 in non-trading.

Buncrana Port and Harbour Improvements. — Great improvements are to be effected at the port and harbour of Buncrana, involving an expenditure of £24,000. The Free State Government is giving a grant of £18,000 for the extension and equipment of the harbour, and the newly-constituted Harbour Board of Buncrana, are negotiating for a loan of £6,000 to supplement the grant, so as to bring the port up to date in the matter of trading facilities.

Transport of Irish Copper Ore to Great Britain.—The little port of Castletown Bere, in Bantry Bay, coast of Cork, is now being regularly utilised for shipments of Irish copper ore to Great Britain. The material is obtained from the Allihies copper mines in County Cork, which are being worked to advantage, and the ore is conveyed by road to the quay at Castletown Bere, which is only a few miles distant, for transport across Channel. A consignment of 200 tons was forwarded recently per the Limerick Steamship Co.'s new steamer "Lanahrone," a vessel of 1,400 tons gross. A good trade in season is also done at this port in the transport of cured mackerel, for Castleton Bere is a well-known fish curing station in West Cork.

Improving the Shipping Accommodation of Waterford.—The Waterford Harbour Board are taking practical steps for the improvement of the shipping accommodation of the port. Recently the Board engaged the services of Mr. Norman Smith, of Aberdeen, to make a survey of the harbour ford for the purpose of the projected deepening of the waterway. The Board has now decided on making a further survey for navigational purposes of the lower end of the ford, and to have this done they have retained the services of Mr. Charles McLeod, B.E., who, since the commencement of the construction of the new jetty at Waterford, has done some excellent work for the Board, and for the improvement of the trading facilities of the port.

Through Rates from the Port of Limerick to Centres in Great Britain.—The Limerick Harbour Board decided at its meetings on October 7th, to support the action of Limerick merchants and traders in resisting the appeal of the Great Southern Railways Co., against the award made by the Free State Railway Tribunal, which was in favour of the importers and exporters of the port of Limerick. In the matter of through rates between Limerick and centres in Great Britain it was stated at the Harbour Board meeting that Limerick suffered a big handicap as compared with Cork, Waterford, and other Free State ports, the disparity in rates for transport being as great as 70 or 80 per cent. The trading community in Limerick are pleased that the Harbour Board are aiding the merchants and traders in the City in opposing the Railways Co.'s appeal.

News from all Parts.

London Shipping & Forwarding Agents' Conference. Annual Dinner.—The annual dinner of the London Shipping and Forwarding Agents' Conference will be held on Monday, November 25th, at the Cafe Royal, Regent Street, W., at 6.45 for 7 p.m., when a large attendance of members is expected. Sir Edward Crowe, C.M.G., Comptroller General of the Department of Overseas Trade, Sir Geoffrey Clarke, C.S.I., O.B.E., Deputy-Chairman of the London Chamber of Commerce, and Sir Ernest Benn, Bart., have accepted invitations to be present and to take part in the proceedings.

White Star Line—Publicity Department.—Mr. R. J. A. Shelley, Publicity Manager of the White Star Line, is retiring after 42 years' service with the Company. Mr. Shelley was educated at Merchant Taylors' School, Crosby, under Canon Armour. Whilst there he was a Harrison Scholar, Windermere Prizeman and Sir John Whitaker Ellis Prizeman. He served his apprenticeship under Mr. Thomas Henry Ismay, founder of the White Star Line, and is one of the very few White Star officials left who came closely in touch with that famous shipowner. Mr. Shelley is a Fellow of the Royal Historical Society. Mr. Shelley will be succeeded by Mr. George Warden, at present the Company's Publicity Manager at Liverpool. Mr. Warden was educated at St. Paul's School and Caius College, Cambridge, where he was a Wrangler in the Mathematical tripos. He saw War service with the Devon Regiment and the Wilts. Regiment in France and Palestine. Before joining the White Star Line he was Secretary to the Atlantic Transport Line.

Railways and "De-Rating." Further Benefits to Industry.—We reprint the following from the November number of the *Railway News Letter*, which is issued from the British Railways Press Bureau, 35, Parliament Street, London, S.W.1. In addition to the rebates given on railway charges to Agriculture and the Coal and Iron trades, the railway companies have announced that as from 1st October last, a series of rebates will be made from the charges in force at their various docks, corresponding to the rate relief accruing to them as dock owners. Unlike the railway rebates scheme, there is not one pool for the whole country in respect of dock rebates, but, so far as it is possible in the varying circumstances, the arrangements are uniform and represent a benefit to industry of upwards of £300,000 per annum. Following the principal of the railway rebates, the greater portion of the relief will be given in respect of coal and iron traffics, thus extending further aid to these basic industries. These dock rebates will be revised from time to time in an upward or downward direction, or as between classes of traffic, as circumstances may require. The rate relief is not a definite sum per annum, but depends upon the rateable valuations of the docks and the level of the rates levied thereon by the local authorities.

Canadian Anti-Dumping Regulations.—Section 6 of the Canadian Customs Tariff, 1907, provides for the imposition of a Special Duty (Dumping Duty) on goods imported into Canada the selling price of which is less than their "fair market value" as sold for home consumption at the time and place of direct shipment to the Dominion. The regulations made by the Customs authorities in 1914 provided that Special Duty should not apply when the difference between the "fair market value" and the "selling price" of the goods to the importer in Canada did not exceed five per cent. of their "fair market value." It was, however, provided that the whole difference should be taken into account for Special Duty purposes when exceeding five per cent. The High Commissioner of Canada in London has now received cabled advice from the Department of National Revenue at Ottawa to the effect that new regulations have been issued cancelling the five per cent. exemption allowance. With certain exceptions specified in Section 6 of the tariff Dumping Duty will, therefore, be applied in future whenever the "selling price" to the importer in Canada is less than the market value in the country of shipment. The new regulations will not be applied in the case of goods purchased by Canadian firms before October 10th and imported into the Dominion before January 15th next.

Cargo Vessel for Greece.—The Acting British Consul-General at Salonica reports that a local concern desires to be put in touch with British shipbuilding firms likely to be interested in quoting for the construction of a cargo boat of 300 tons net. The firm would also consider the purchase of a suitable secondhand vessel. Firms desirous of offering a British built vessel can obtain details of the enquiry upon application to the Department of Overseas Trade, 35, Old Queen Street, London, S.W.1. Reference number A.X.8747 should be quoted.

Proposed Ship Canal Between Forth and Clyde.—Mr. Herbert Morrison, Minister of Transport, has appointed a Committee with the following terms of reference:—"To consider the proposals which have been made for the construction of a ship canal between the Forth and the Clyde; to examine into the nature and extent of the advantages which might be obtained from the construction of such a canal, and the probable economic results of its construction; and to report their conclusions." The members of the Committee are as follows:—Sir Sydney Chapman, K.C.B., C.B.E., Chairman; Commander W. H. Gell, D.S.O., R.N.; Mr. N. A. Guttery; Mr. P. R. Laird; Mr. A. T. V. Robinson, C.B.E.; Mr. F. B. Tombleson; Mr. J. L. Stewart Moore (Secretary). The Committee is now prepared to receive from responsible bodies and persons statements in writing relevant to matters covered by the terms of reference. All communications relating to the work of the Committee should be addressed to the Secretary, Mr. J. L. Stewart Moore, at the Ministry of Transport, Whitehall Gardens, London, S.W.1.

Wireless Telephony on White Star Liners.—As long ago as May, 1923, the forethought of the White Star Line for the convenience of its passengers prompted their management to fit a wireless telephone installation on the ss. "Olympic," the apparatus having been specially designed and supplied by the Marconi Co. There was, however, at that time no clear demand by the travelling public for the facilities such as were then available and the service was, therefore, not extended. Since 1923, great strides have been made in the matter of communication by wireless telephony between ship and shore and—hardly less important—the public seems nowadays to have thoroughly acquired what may be termed—the long distance telephone habit. Once again the White Star Line is keeping abreast of progress. They have made arrangements whereby the Standard Telephones and Cables, Limited, will instal at an early date short wave Radio Telephone Equipment on board the "Olympic" and the Marconi Marine Co. will co-operate in the experiments with this equipment on board (the Marconi Marine Co. being responsible for the wireless telegraph service on all White Star Liners). It is anticipated that, as the result of experiments made with this installation, passengers on the "Olympic" will be enabled to telephone from mid-ocean to their homes or places of business and carry on ordinary telephonic conversation, in which case, the White Star Line intends to place similar advantages at the disposal of passengers on their other vessels.

Last Passenger Steamer to Leave the St. Lawrence this Season for the United Kingdom.—The White Star liner "Megantic," which sails from Southampton on November 16th for Quebec and Montreal, will leave the latter port on her homeward voyage on November 28th, being the last passenger liner to leave the St. Lawrence for the United Kingdom this season. The "Megantic," in conjunction with the "Calgaric," maintains a regular service between London and Southampton, and Quebec and Montreal, which represents an important branch of the White Star Line's large interest in the Canadian Trade.

Quick Work at Middlesbrough.—The L.N.E.R. report that recently the ss. "Glenogle" shipped 2,173 tons of sulphate of ammonia and other traffic in one day at No. 9 Quay, Middlesbrough Dock. The loading was carried out at a rate equal to 24.46 tons per hour, and the total tonnage loaded into the vessel in one day is a record for Middlesbrough Dock.

REUTERS TRADE SERVICE.—By special arrangement with Reuters Trade Service we are publishing news items from all parts of the world dealing with transport matters.

Digitized by Google

The Kerr, Stuart Diesel Lorry.

ECONOMY in transport—that, in a nutshell, is the reason for and the objective of the Diesel engined lorry. It explains why, for years past, continental engineers have concentrated in the development of this type of engine for road transport purposes. It represents one of the desirable heirlooms of the war (in fact transport is much indebted

THE KERR, STUART DIESEL-ENGINED 7-TON LORRY.

to research carried out during the war period) because even though it was not exactly conceived during the war it was the dire necessity during the war period that accelerated its development.

In some of the belligerent nations there was great petrol shortage though heavy fuel oils were available. and it was the engineers of one of these nations, Germany to wit, who turn their ingenuity to the development of an engine of this description for road transport purposes. Though they came near to doing so they did not entirely achieve their object during the war period, and it is only during the past couple of years that it has become a practical proposition. A well-known firm of British engineers, recognising its vast possibilities secured the manufacturing rights in this country. They have applied the engine almost exclusively to slow moving portable units such as road rollers and ploughing tackle with marked success, as we all know. Now, the old-established engineering firm, Kerr Stuart & Co., Ltd., California Works, Stoke-on-Trent, have gone a step further by applying the power unit to ordinary road transport, and to this firm lies the credit of producing the first all-British diesel engined lorry.

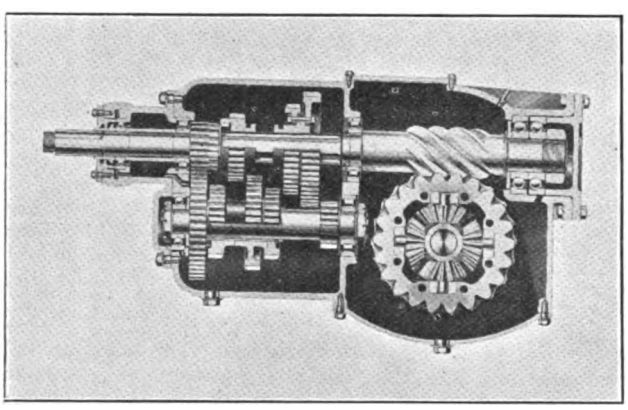
Dealing first with the advantages this type of power unit offers: The most important item is, perhaps, the great saving in cost of fuel, and the next most important advantage is the robustness in construction the engine permits, that is to say it is practically devoid of all delicate fittings which are a fruitful source of trouble in the majority of engines. Economy in the cost of fuel, advantageous as it is even in this country, is not the sole advantage in this connection. The type of fuel is an additional advantage. Petrol is plentiful at home and comparatively cheap as compared with the price in other countries, whereas suitable oil for the diesel engine is almost everywhere readily obtainable at a reasonable price and, therefore, in countries where the scarcity and great cost of petrol make mechanical transport almost prohibitive, the diesel engine provides the opportunity for great development. Another important advantage is that it is fire proof. Now with regard to the Kerr Stuart diesel engined lorry: Though it is the first all-British vehicle of this description, the type is long past the experimental stage. It has been successfully applied on the Continent for some years past, and more recently in this country.

The Kerr Stuart lorry may be regarded as the latest improved development of the type. The firm built the first model some time ago and have had it undergoing the most exacting tests for more than six months past, all of which it has passed through with the most satisfactory and encouraging results. The model the firm is now placing on the market, and which can be seen at the forthcoming Roads and Road Transport Exhibition, is an improvement on the first model in that they have been able to cut down the weight of the chassis so as to enable it to carry, legally, a paying load of 7 tons.

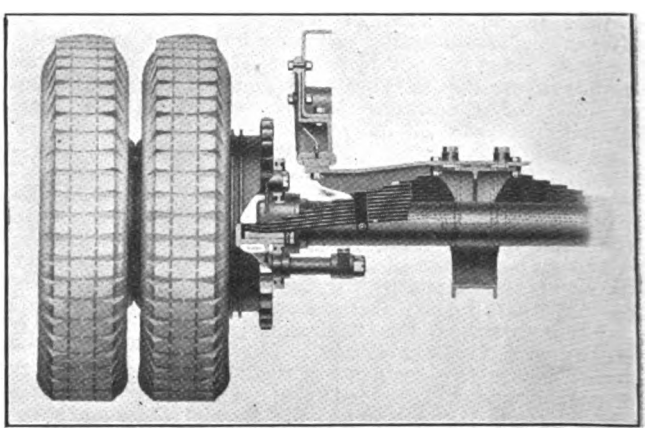
There is one point concerning which we confess to having been doubtful, namely, acceleration: we were inclined to believe that the movement would be sluggish. We were quickly disillusioned on this point during a demonstration we recently observed. We could detect no difference in the behaviour of this vehicle in this respect to that of a first-class petrol lorry, and it can quickly accelerate to a speed of 30 miles per hour on an average road with a full 7-ton load. The machine, however, is built for a normal speed of 20 miles per hour with the engine running at a speed of 800 revs. per minute.

Adverting once more to the subject of fuel: we are assured by Kerr Stuart & Company that with a full load their tests have proved that ten miles to the gallon are obtainable under ordinary working conditions. With fuel oil at £7 10s. per ton the cost per gallon is 4d.

The layout of the chassis is interesting. The engine is placed directly over the front axle and the driver's position is beside the engine in a roomy cab providing an unobstructed forward view. From the engine, power is transmitted through an inverted cone clutch and a Hardy Spicer fabric jointed propeller shaft to the gear box slung amidships. The gear box also houses the worm driving shaft and the differential gear, the shafts of which carry large diameter-chain sprockets, from which the final transmission to the driving wheels is by a pair of 2¼ in. pitch silent roller chains, the chain rings being on the driving wheel brake drums. The dead back axle reduces the unsprung weight to a minimum, and so the life of the tyres is materially prolonged.



KERR, STUART GEAR BOX AND WORM DRIVEN LAY-SHAFT.



SHOWING THE TRANSVERSE BACK AXLE SPRINGING OF THE KERR, STUART LORRY.

Dealing now with the engine itself: it is a four cylinder four stroke type fitted with overhead valves. It has no magneto and no carburetter and this practically constitutes all the difference there is between it and an ordinary petrol engine. The compression, however, is very much higher, and it is this compression that raises the temperature of the air within the cylinder on the

Digitized by Google

compression stroke to such a degree that it ignites the fuel injected into the cylinder. The fuel is injected into the cylinder in the form of a very fine spray just at the top of the compression stroke when the piston is just about in the dead centre position. The mechanism adopted for forcing the fuel into the cylinder is by the provision of a fuel pump, one for each cylinder connected thereto by a high duty small bore copper pipe. The oil pumps are cam operated the camshaft being positively gear driven from the timing gear, and the pumps are carried on the side of the engine in a most accessible position. The oil pumps are also fitted with a hand operated gear to enable them to be flushed through to remove grit or air. Each pump delivers to an atomiser on the top of its cylinder, the former being simply a spring loaded valve with a suitable aperture to cause the oil to enter the cylinder in the form of a fine well-spread spray.

Naturally, with an engine having a compression of in the neighbourhood of 450 lb. per square inch, a means of easy starting has to be provided. This is accomplished by the provision of a small petrol motor such as is used on a motor cycle, and a very simple friction mechanism connects it to the fly wheel of the main engine. The time occupied in starting is from 20 seconds to 2 or 3 minutes according to the temperature of the atmosphere at the time.

The engine is pressure lubricated by an oil pump deep down in the sump which forces the oil through the drilled crank shaft to the big ends and from the big ends to the little ends. A second feed lubricates the camshaft and fuel pump assembly, whilst the cylinder walls are lubricated by the spray thrown off from the big ends.

The general layout of the chassis has been referred to above, but the following are a few of the interesting details:—

Back Axle.—The back axle springing is of a particularly interesting description. The manufacturers have dubbed it "enharmonic" springing, enharmonic meaning, according to the dictionary, "an epithet applied to such a species of composition as proceeds on very small intervals." Perhaps it fits the case but anyhow it sounds very learned. The firm say they have used "enharmonic" to describe the arrangement because it makes use of the difference in the natural rates of oscillation of two springs to give a springing system which, whilst being fully resilient, has a minimum amount of bounce. In any case we saw the vehicle being run at speed over exaggerated ground inequalities and the springing was certainly most effective. As may be seen from the accompanying illustration there are two transverse semi-elliptic springs, and these are carried at their centres by a special cross member above the dead axle. The springs are positioned one on each side, the axle and their outer ends rest on pads within the brake drums. This system of braking has been patented. The front springs are semi-elliptic of the usual type. This it will be seen that the whole of the chassis above the axles is three point suspended.

Easy steering is provided by the Marles patent steering gear.

The foot brakes operates on all four wheels and the hand brake on the two rear wheels.

The standard platform is 15 ft. 3 in. long by 6ft. 6½ in. wide. The wheelbase is 13 ft. 6 in., the rear track 5 ft. 8½ in., front track 6 ft. 2 in., loading height 3 ft. 9¾ in., overall height of cab 8 ft. 9½ in., turning circle 56 ft., overall length 22 ft. 3 in., overall width 7 ft. 3 in.

In conclusion we may say that we were very favourably impressed with the behaviour of the lorry under demonstration as we also were with the general details of construction, and we have no hesitation in recommending our readers to take an early opportunity to examine it carefully and try it out for themselves.

Air Transport Notes.

Imperial Airways Winter Services.—A Winter Services Time Table (European Division) for 1929-1930 has been published by Imperial Airways, Ltd., Airways House, London, S.W.1., giving details of services between London and the following centres:—Paris, Basle, Cologne, Brussels, Amsterdam, Berlin, Rotterdam and Hanover.

Genet Avian Success.—The 80 h.p. Genet engined Avian won the Montreal Air Derby against all comers. The engine was a perfectly standard production built and tested at the Armstrong Siddeley Works in Ottawa and fitted with the Townend ring. The Genet engine has thus won all three big open races in Canada.

Proposed Air Port in the Azores. — Lt.-Col. Cifka Duarte, who lately went to the Azores to study the best site for an international air port there, states that the Island of Terceira offers the best site, a place called Achada, which is splendidly situated about 3½ miles from the town. When levelled, Reuters Lisbon Correspondent says, the ground will be naturally of the kind which the Germans have made artificially on their landing places; there is water in the near vicinity, and the surroundings are such that landings will be able to be made in any direction according to the prevailing wind.

Argentine—U.S. Air Service.—A Buenos Aires message says that a decree has been issued authorising a U.S. company to carry on an air service between the United States and Argentina.

Air Services in Dutch East Indies.—The anniversary of the inauguration of the air services in Java, which are running smoothly, was marked by the historic opening, on November 1st, of a direct service between Batavia and Sourabaya, a distance of 800 kilometres. The distance was covered in four and a half hours (as opposed to the train journey of one and a half days). Two big Fokker aeroplanes with a full complement of passengers inaugurated the service.

American Company and South African Air Services.—Active American participation in flying in South Africa in the near future is indicated by the announcement in the "Cape Times" that an important agreement was about to be concluded between General Motors, South Africa, Limited, and Union Airways, Limited. The latter company at present runs an air-mail service between Durban and Cape Town. Under the agreement, General Motors will closely co-operate with Union Airways in regard to air-mail and passenger services. General Motors recently purchased a substantial interest in the Atlantic Aircraft Company, who are the American concessionaires for the building of all types of Fokker aircraft. Union Airways have ordered from General Motors a Fokker Universal six-passenger machine which will come into service in December. The company intends to repeat the order as the services develop.

Sealed Gipsy Moth Test.—A very interesting test has just been concluded with a de Havilland Gipsy Moth engine. In December, 1928, a standard "Gipsy" engine was taken at random from the flow of production, installed in a standard Moth and sealed throughout by officials of the Air Ministry Aeronautical Inspection Directorate. A few days ago the machine completed 600 hours flying covering 51,000 miles at an average speed of 85 m.p.h. without decarbonisation. Pratts High Test petrol was used throughout, the consumption being 19½ miles per gallon. The engine, which was running perfectly at the conclusion of the test, was then dismantled under the same official inspection and it was found that only £7 worth of replacements was necessary to maintain the Air Ministry Certificate of Airworthiness. This performance provides a convincing indication of the high standard of design and workmanship attained by British aero engine construction.

Future Schneider Trophy Contests. Government's Decision Not to Participate.—The Air Ministry announces that the Government have had under review the future policy in regard to the Schneider Trophy contest in 1931 and subsequent years. After careful consideration, it has been decided that a Royal Air Force team will not again be entered, thus leaving British participation to private enterprise under the auspices of the Royal Aero Club. Two main considerations influenced this decision:—(1) That, owing to Government participation in recent years, the contest has assumed a character not in accordance with the intentions of M. Jacques Schneider, its originator and the donor of the Trophy. (2) That, although the entry of a Royal Air Force team was calculated to give a much needed impetus to the development of high-speed aircraft—and did so notably in the two latest contests—sufficient data have now been collected for practical development in this direction, and the large expenditure of public money involved by Government participation is, therefore, no longer justifiable. This decision should not, of course, affect the entry of British machines in future contests. Convincing proof has now been furnished of what the British aircraft industry can do, and the wide public interest displayed should make it possible for our pilots and machines to compete in what is intended to be a sporting International event on a basis of private enterprise.

Merseyside Notes.

FROM OUR OWN CORRESPONDENT.

Obituary.—Mr. Gilbert Batty, who died at Blackpool on October 13th, was a shipping agent and organiser of motor tours under the title of the Batty-Holt Touring Service, in Coronation Street. In the publicity profession Mr. Batty was well-known all over the country.

Protection for Meat Traffic.—Following representations made by the Liverpool Meat Importers Association the Mersey Docks and Harbour Board intends to erect a roofing extending for 350 feet over the roadway at the west end of the Northside Brocklebank Branch Dock, at a cost of £5,342 and also to provide a new cross-over road on the railway line at the south side of the Langton Graving Dock. These facilities will provide much-needed protection for laden meat wagons and make for the more expeditious handling of the cargo at these docks.

More Buses for Liverpool.—Because of the increasing competition of private motor bus services in the city of Liverpool, with its corresponding adverse effect upon the tramways undertaking of the Corporation, the Tramways Committee has adopted a resolution empowering the Tramways manager to invite tenders for 50 motor bus chassis from the principal manufacturers. Application is being made for sanction to the borrowing of the sum of £85,000 for the provision of new omnibuses.

Anti-Splash Move.—A proposal has been made to the Liverpool City Council that the Town Clerk should approach the Association of Municipal Corporations to take steps to get the Ministry of Transport to make it compulsory for heavy motor vehicles and omnibuses to use some device to prevent the splashing of pedestrians.

Personal.—Mr. H. W. Laing, manager of the Lytham St. Annes tramways and bus undertakings has resigned. Mr. Laing has had charge of the tramways undertaking in Lytham St. Annes for 23 years, for he was manager when it was controlled by a private company long before the Corporation became the owners. He came to Lytham St. Annes from Cambridge, where he was one of the first men in the country to run a municipal bus service.

Weight Restrictions on Northwich Roads.—Owing to subsidence following the pumping of brine for the manufacture of salt and chemicals, several thoroughfares in the Northwich district are to be closed to vehicles exceeding three tons in weight. Warrington Road, connecting Northwich with Warrington is the most expensive road in Cheshire from the standpoint of maintenance.

L.M.S. and C.M.S.—Members of the staff of Crosville Motor Services, Ltd., held their Annual Dinner at Chester on October 24th. Mr. C. Crosland Taylor (managing director, Crosville Motor Services, Ltd.) said the absorption of the Crosville organisation in the L.M.S. was a change which affected everyone making their position more important than before. The Crosville Company had been going now for 23 years. In that time they had spent £500,000 on buses. They had 475 buses, of which 130 had been sold, and they handed over to the L.M.S., a fleet of 342 buses in good order and condition. When the Crosville started they had eight miles of route, but now had over 1,300 miles, excluding duplication and the London services. They dealt with 100 local authorities; their routes passed through 14 counties and they held licences in eight county boroughs. Mr. Taylor then read a list of staff promotions. It would perhaps take them (the Crosville) some time to get into the railway way, he said. There must be co-ordination. Mr. Ashton Davies (general Supt. London, Midland & Scottish Passenger Commercial) said that the C.M.S. services had now become L.M.S. services. When dealing with transport it had to be remembered that the means of communication and transportation were the life blood of the nation. The future of the nation depended upon efficient transportation. This was an era when all forms of transport required to play their individual part in this great national scheme for the movement of people and goods.

Ribble Motor Station. — Ribble Motor Services, Ltd., who have a motor bus station in Dale Street, Liverpool, have acquired adjoining property which at some future date will be reconstructed and presumably adapted for the needs of the organisation.

Advertisements on Vehicles. — For using a vehicle to display advertisements without the consent of the Birkenhead Corporation in writing, Gilbert S. Hoyle, of Manchester, was fined 20s. at the Birkenhead Police Court. A police constable stated that the lorry was built as an old-world paddle steamer and was brightly illuminated.

4,500 Vehicles Per Day.—Recently, a traffic census was taken outside Kendal Town Hall over a period of seven days. The total number of vehicles passing there during that period was 50,086, of an approximate total weight of 80,417 tons. On one particular day there passed 790 motor buses, 2,934 motor cars and 878 motor cycles.

Birkenhead Plans.—Birkenhead Corporation, which successfully operates a large fleet of motor buses, proposes to promote a Bill in the next session of Parliament under which powers will be sought to substitute the present system of electric tramcars by omnibuses of the trolley vehicle type. In addition, the Corporation is to seek extended powers for the running of motor omnibuses in districts outside the borough boundaries.

The Value of the Travel Industry to the British Isles.

IN a statement issued to 50,000 business houses, banks, associations and private persons, the Travel Association of Great Britain and Ireland invites support for its work of undertaking publicity abroad on a national scale on behalf of Great Britain and Ireland, and calls attention to the great potential value of the travel industry to the trade of the country and to the cause of international understanding.

The statement is issued under the authority of a Grand Council, representative of the Government, High Commissioners of the Dominions, leading travel firms, Chambers of Commerce, Municipalities and Association for the preservation of the historic and natural beauties of Great Britain and Ireland.

Lord Derby is President of the Grand Council, Mr. Louis Beale, C.B.E., General Manager of the Association, and Mr. L. A. de L. Meredith, O.B.E., Secretary. All communications should be addressed to the Secretary, Kinnaird House, 1 Pall Mall East, London, S.W.1.

The Travel Association opens its case with a reference to the hundreds of millions of pounds spent annually by visitors to Europe, and asks why the share of Great Britain is so small? Mainly, it replies, because we have never carried on a national permanently active campaign of publicity abroad.

Publicity plans of the Travel Association include the display abroad of posters and photographic enlargements, with the legend "Visit Britain" printed in the language of the country; the issue of photographs and illustrated articles for the press; the preparation of a complete calendar of forthcoming events, with information of assistance to visitors, for 1930; the establishment of a Press Department for the issue of news abroad; participation in international exhibitions abroad; the entertainment of distinguished visitors; wireless and film publicity; agents to be appointed abroad. At home, the Association will study conditions which may require amendment in the interests of foreign travellers.

The statement concludes with the fact that the Association has now nearly 250 members, and an income of £18,000, which sum is, however, "inadequate to carry on an effective world-wide scheme of publicity." The Government is doing its part, and many large subscriptions have been received. It is now hoped that there will be a large increase in membership and generous support from business firms, associations, and private individuals.

Precautions Against Freezing Petrol Motor Vehicles.—Practically every winter a number of motor vehicles suffer damage by the action of frost, and in order to assist motor owners the Royal Insurance Company, Limited, have prepared a card showing some simple precautions for avoiding damage to vehicles from this cause. The Company will be happy to forward a copy of this card to any of our readers who care to apply to the Company's Head Offices at 1 North John Street, Liverpool, or 24/28 Lombard Street, London, or to any of their Branches.

American Road Builders' Association. — Mr. Rees Jeffreys, Chairman of the Roads Improvement Association and a representative of Great Britain on the Permanent International Association of Road Congresses, has accepted the invitation of the American Road Builders' Association to act as their honorary representative in England. The American Road Builders' Association represents the Highway industry of the United States, and its headquarters are at Washington, D.C.

Manchester Notes.

FROM OUR OWN CORRESPONDENT.

Tender Accepted.—Manchester Corporation Paving, etc., Committee has accepted the tender of Messrs. S. A. Green for the hire of horses and carts.

Stud of 389.—In the annual report of the Manchester Corporation Cleansing Department, issued on October 26th, it is recorded that the vehicles used by the department (on March 31st last) comprised 578 horse-drawn carts, seven S. D. Freighters, three Karrier sweepers and dust collectors, twelve Lacre sweepers and three Commer tipping waggons. The Cleansing Committee has a stud of 389 horses. The average price paid per horse during the year was £74 16s. 0d. Depreciation was accounted for thus: mortality twelve horses = 3.08 per cent.; sales (less number purchased to receipts) 43 = 11.05 per cent.; average depreciation over 45 years, 12.22 per cent.

Fair Wage Clause in Cartage Contracts.—The question was asked at the October meeting of the Stalybridge Town Council whether the chairman of the Highways Committee could give an assurance that carting contractors employed by the Highways Committee were paying to their men the trade union rate of wages. Councillor Walker replied that the question of carters' wages had been before the committee on many occasions and they had done all in their power to see that the Fair Contracts Clause was carried out. The biggest difficulty was that they could not always get the facts from the people immediately concerned. The surveyor had promised the Committee that no carting should be done by men who were not receiving the trade union rate of wages.

One-Way Traffic.—Manchester Traffic Congestion Committee, on October 18th, discussed further schemes for more one-way traffic streets. Proposals have been made in respect of the following streets: Tib Street, from Swan Street to Market Street; Oak Street, from Thomas Street to Market Street; Hanover Street, from Shudehill to Dantzic Street; Mayes Street, from Dantzic Street to Shudehill.

New Transport Committee.—Steps are being taken to form a transport section of the Manchester Chamber of Commerce, the first chairman of which will be Sir Joseph Nall. It is intended to make the transport committee completely representative of the trade, commerce and transport of the city and port of Manchester. Invitations to join the committee have been addressed to Mr. R. C. Reynolds (Bleachers' Association), Mr. R. W. Royle (C.W.S., Manchester), and Messrs. H. Allcock, A. M. Buxton, R. Bond, John Allan, R. Graham, H. M. Gibson, A. J. Green, R. C. Irwin, W. Mc.L. Hamilton, W. M. Nield, L. F. Massey, M. W. Newton, Howard Spence, W. H. Zimmern, and Mark Winder.

More Railway Motor Buses.—Another new railway road service is that which was inaugurated on October 17th by the L. & N. E. Railway and L. M. & S. Railway between Sheffield and Manchester. The new service comprises six trips daily in each direction, the stops being limited to fourteen places. The whole journey occupies two hours and twenty minutes and through fares are 3s. 8d. single and 5s. 10d. return. A.E.C. 29-seater coaches and Thornycroft 32-seater coaches of the all-weather type provide the main services.

An Appropriate Change of Title.—The chairman of the Bolton Tramways Committee has given notice of his intention in the near future to propose a change in the name of the Committee to the Bolton Corporation Transport Department.

To Run Buses.—The Urban District Council of Prestwich have decided to promote a Bill in Parliament to enable them to run their own bus service.

Heavy Salford Traffic.—A recent census showed that in ten hours, 14,752 vehicles passed along Chapel Street, Salford, an increase of about 9,000 vehicles since 1922. In Salford, the Chief Constable has endeavoured to ease the burden of the main road from Liverpool to Manchester by the diversion of traffic, and it is his intention to relieve other main thoroughfares by similarly adopting alternative routes.

Bolton's Up-to-Date Fleet.—During the annual inspection of passenger-carrying vehicles licensed by the Bolton Corporation, the oldest vehicle on view belonged to the year 1921. The Chief Constable and members of the Watch Committee were much impressed by some of the latest types of single decker vehicles, particularly the arrangements made on some buses for emergency exits. One of the Bury Corporation buses, used on the Bolton-Rochdale service, has two doors on the near side and an emergency door at the rear. When the latter opened a step automatically dropped into position. The position of emergency doors on all vehicles came in for close inspection, and the view of the Committee was that the best place for them was at the rear of the bus.

Yorkshire Notes.

FROM OUR OWN CORRESPONDENT.

Welcome Legislation.—In no part of the country will the revision of the motor-bus licensing problem be more welcome than in Yorkshire, where the anomalies of the present system are more accentuated than in other parts of the country by the closely knit town system, with licensing conditions varying in each town and complications brought about by the interests in tramways which the various local authorities have. It is totally impossible for the existing licensing authorities to act judicially owing to the conflict of interests.

Transport and the Elections. — Passenger transport systems have come in for a good deal of comment in the recent election campaigns, particularly in Halifax and Bradford. In Bradford the deputy-chairman of the Tramways Committee, speaking at a meeting in support of a candidate, gave an explanation of the purchase by the Coroporation of the Calder Bus Company, of Bailiff Bridge, which the Corporation sold to the Hebble Services of Halifax before that concern entered into arrangements with the railway companies. He praised the foresight of the Tramway Manager, and referred in detail to the difficulties the Corporation had to face in getting powers, and the delay in getting powers during which the opposition companies were able to start services before them. He said they lost £13,000 per annum on the Bingley route, along which 40 buses ran every thirty minutes, and yet so long ago as 1921 the Bradford Corporation approached the Keighley Corporation with a view to running a through service. They then found that they had not got the powers to do so.

Trade Conditions.—The threatened textile strike in the West Riding has had an adverse effect upon trade, and conditions, with the approach of winter, are not good. The motor coach industry had a good long run up to the end of the licensing period, the illuminations at Blackpool providing a good share of late season-traffic, for which the coach owners were duly grateful. The week-end and mid-week football traffic by coach is growing, and there is much being done in running to race meetings. The coach is being more freely used by choirs and parties going to competitions and similar events and the public appears to be recognising that parties are kept together better when they travel by coach than when the railway is used.

Stop Lights for Buses.—A curious suggestion has been considered by the Wharfedale Joint Licensing Committee, which has its centre at Otley, but covers a number of small townships in the Aire and Wharfe Valleys. The Committee appear to feel that there is a danger to other traffic due to the constant stopping and starting of vehicles in narrow roads, and they are desirous of having lights affixed at the rear of licensed vehicles to indicate when a bus is about to stop and to give a warning to overtaking and following traffic. This may be one of the desirable features to be incorporated in a futurist vehicle with all the ideal equipment one could wish for, but it is scarcely a practical suggestion. The mechanical inspector told the committee he knew of no regulation under which they could insist upon such a fitting, but the matter is being referred to the Ministry.

Ministry's Discrimination. — Bradford recently applied for a provisional order to enable nearly forty tramway routes to be turned over to trolley vehicles. At the inquiry, held in Bradford, there was considerable opposition to certain of the routes, although it was definitely stated that change over would only be made as the tram tracks were worn out and after due consideration had been given to the possibility of renewing the tracks or substituting buses. It was not intended to scrap the trams all at once. The Ministry of Transport has intimated to the Corporation that certain of the applications in regard to particular routes have been approved, but a number of others have not. The ones which have not been approved appear to be those upon which it is considered there will be some danger in view of the turning points and the obstruction to traffic which the vehicles would be at the terminal points. The Corporation's position in regard to these routes will be that in case it is considered to be too expensive to renew tram tracks they will have to fall back upon motor-buses.

Congratulations. — The congratulations of his many friends in the motor transport industry will be extended to Mr. C. Holdsworth, of Halifax, on his election to the Halifax Town Council. Mr. Holdsworth has had a life-long association with the haulage and passenger transport industry, and along with his brother, founded the Hebble Services, which were purchased by the railway companies early this year. Mr. Holdsworth is still connected with the firm of O. & C. Holdsworth, haulage contractors, furniture removers and funeral undertakers. His knowledge of transport should make him a very useful member.

North-East Coast Notes.

FROM OUR OWN CORRESPONDENT.

Bus Company's Development.—The business of Messrs. T. Allen and Sons, Blyth, motor-bus operators, is being formed into a limited liability company. It is proposed to make a substantial increase in the fleet of buses—there are now sixteen operated by the concern—extensions to garage accommodation and the provision of services over new routes. A number of other operating companies, it is stated, are likely to be absorbed in the new company. Established as a haulage contracting business about forty years ago by the late Mr. Thomas Allen, of Blyth, the firm now maintains daily services between Blyth-Morpeth, Blyth-Whitley Bay, Blyth-Newcastle, and Newcastle-Edinburgh-Dundee-Aberdeen.

New Coast Road Buses.—The new coast road between South Shields and Sunderland opened on November 2nd by the Minister of Transport (Mr. Herbert Morrison, M.P.), has cost £200,000. South Shields Tramways Committee recommends the Town Council to apply for permission to run a service of buses over the road, which opens up a delightful portion of coast line. A new bridge, costing £30,000, had to be constructed at Marsden, while the Marsden railway had to be set back and a station and other buildings pulled down and reconstructed.

Robot Rule Flaw.—The Newcastle Bench has dismissed several cases where motorists had failed to observe the traffic signals when there was no evidence that traffic was passing in the opposite direction. A local representative of the Automobile Association, interviewed on the matter, expressed the opinion that there was a moral obligation on motorists to observe robot signals. New regulations will, however, probably have to be made.

No Licences!—As the result of a check carried out by the Northumberland police during the first fourteen days of the third quarter of the current financial year, 1,322 motor vehicles were reported as having been seen in use on the highway without proper licences. The County Standing Joint Committee authorised proceedings in eleven cases.

New Garage.—The Northern General Transport Co., Ltd.'s new garage in Mile End Road, South Shields, was officially opened on October 30th. The new premises also house the buses of the Jarrow and District Electric Traction Co., Ltd., which some time ago substituted buses for their tram service. A large proportion of the tramlines and overhead wires have been sold, and the work of removing the track is proceeding apace.

Traffic Robots.—Newcastle's lead in the matter of automatic signals and refuge islands is being followed by Gateshead, while South Shields is also going to have street "islands" on the recommendation of the Borough Engineer (Mr. J. Paton Watson). Gateshead's Chief Constable also wants better lighting.

Tees Tramways.—Stockton Corporation has decided to promote a Bill in Parliament seeking to scrap its portion of the tramway undertaking, which is jointly owned by the Corporations of Stockton, Middlesbrough, and Thornaby, and to substitute a fleet of motor buses. The tramways were purchased by the three municipalities eight years ago from a private company for £300,000. Middlesbrough Corporation will oppose Stockton's Bill.

Order Revised.—Newcastle Corporation is purchasing a combined motor sweeper, sprinkler, and collector, at a cost of £975, in lieu of a new motor sweeping-machine provided for in the current year's estimates, at an estimated cost of £500.

A New Road.—Work for about 2½ years will be found for 430 men in making a new road from Stanley to Newcastle, which will shorten the journey by about half-an-hour. The work is estimated to cost £130,000.

Central Bus Station Move.—A big central bus station near the church is suggested in Consett town planning scheme. Platforms and waiting rooms would be provided.

Bus Shelter Refused.—A proposal to erect a public shelter in the Market Place at Bedlington was described at a meeting of the local authority as an attempt to subsidise the private bus companies and was rejected by nine votes to seven.

Blyth's Buses.—Blyth Town Council has decided to promote a Bill in Parliament empowering it to run a municipal service of motor buses.

How City Trams Benefited.—The North-East Coast Exhibition benefited Newcastle Corporation tramways directly to the extent of £15,252 in penny fares to and from the Central Station.

Midland Notes.

FROM OUR OWN CORRESPONDENT.

L.M.S. Scheme for Birmingham to Bristol Line.—The L. M. and S. Railway is proceeding with its scheme for improving the lines between Birmingham and Bristol Port, with the object of speeding up the trains, and allowing heavier loads being carried. The whole track is being overhauled. One big section of the scheme was the demolition of Cofton Tunnel, between Bromsgrove and Barnt Green, and the construction of a big cutting through Cofton Hill. This work, and the widening of the line between Barnt Green and King's Norton has cost approximately a quarter of a million. The whole of the track between Birmingham and Bristol is to be overhauled to carry engines of the most modern type.

Traders and Railway Wages.—Birmingham traders are concerned with the recent decisions of the railway companies to restore the 2½ per cent. reduction of rail wages, the demand by the employees for a further 2½ per cent. increase to be considered next May. The Railways and Transport Committee of the Chamber of Commerce is asked to inquire how far this will affect traders. At a recent meeting of the Council it was pointed out that, though the railways had benefited by de-rating, these benefits had been passed on to specific traffic, such as coal, iron and steel, the railway companies not having retained any portion of the de-rating money for themselves.

Birmingham and Traffic Congestion.—Councillor J. E. Corrin, reporting to a meeting of the Trades Council on the Lord Mayor's Conference on the subject of Birmingham Traffic Problems, said it had been suggested that buses and trams should not be allowed to set down passengers in the centre of the city. The chief cause of the congestion, he said, was the parking of vehicles in the centre. Buses and trams carried far more passengers than private cars, and any curtailment of tram and bus facilities would be a serious matter for the public and the Tramway Department would suffer. A resolution to this effect was carried.

"Safety First" in Schools.—Ald. A. H James, Chairman of the "Safety First" Council, on the occasion of a recent distribution of prizes in connection with the schools competition, said the competition, which was initiated six years ago, had played an important part in promoting safety in the streets. The Lady Mayoress made a plea for more tidiness in the streets. She presented certificates to delegates of 184 schools which had taken part in the competition, representing a total of 5,569 successful scholars.

The Late Mr. Alfred Baker.—Deep regret is expressed throughout the whole of the Midlands at the death of Mr. Alfred Baker, who was for 25 years manager of the Birmingham Tramways. He was described as a "Transport genius." Two hundred authorities and organisations were represented at his funeral on October 30th.

Bus Overloading.—A campaign against bus overloading is being waged in Stoke, and a large number of prosecutions are being made.

Stoke to Buy Buses.—Stoke-on-Trent City Council, on October 29th, decided to promote another Bill in Parliament for power to enable the Corporation to operate bus services in the city.

Midland Railway News.—Mr. A. Brook, the superintendent of the Birmingham Great Western Railway Division, has retired from service on reaching the age limit. Mr. W. E. Hart, for seven years superintendent at Worcester, succeeds Mr. Brook, while Mr. R. W. Higgins, the Assistant Divisional Superintendent at Worcester, will succeed Mr. Hart. Joining the G.W.R. in 1878 Mr. Brook was in 1903 transferred to the outdoor staff of the Plymouth Division, and became Superintendent of the Line. He came to Birmingham four years later—in 1907—and was appointed Chief Clerk to the Divisional Superintendent. He was subsequently promoted to Assistant Divisional Superintendent. He was moved to Worcester as Divisional Superintendent at Worcester in 1918, and in 1922 was appointed to the post from which he is now retiring. Mr. Brook was formerly a member of the Worcester City Council, is a J.P., and a member of the Birmingham Licensing Committee. Mr. Hart was Assistant Superintendent at Birmingham before going to Worcester, and now, of course, goes back to Birmingham. Mr. John Aucott has just retired from the Parcels Department of the L.M.S. in Birmingham after being with the company 47 years. Mr. Aucott was very popular with the trading public, and was regarded as an expert in railway transport organisation. He had the respect and confidence of the business men of the city.

Hull Notes.

FROM OUR OWN CORRESPONDENT

Municipal Aerodrome Opened.—Hull has achieved one of its ambitions. It has become one of the first municipalities to possess an aerodrome. Prince George, emulating the example of the Prince of Wales, flew to the city to open it. Great developments are expected because of the port's highly favourable geographical position. Lord Thomson, the Air Minister, is amongst those who have pointed that out. Hull, he says, is on the fringe of a great industrial area, and is the natural jumping off point for Northern Europe. He believes seaplanes will be going as regularly from Hull to the North of Europe as motor cars go westward from the city to-day. His Lordship did not venture to put a date to the full fruition of that conception of Hull's aerial greatness, but local enthusiasts believe in the truth of his prophecy.

Tramways Chairman Defeated. — The Municipal elections did not bring many changes, but one of the two old members to be defeated was Mr. C. P. Sherwood, the Chairman of the Corporation Tramways Committee. During his three years' control of the tramway undertaking, Mr. Sherwood has ruled firmly and with an eye to the interests of the service as a whole. In many respects it has been a difficult and thankless task, unequalled by any other in the Corporation. Mr. J. Henson, a Labour member particularly interested in the organisation of tramway men and busmen, retained the seat he won at a by-election some months ago.

Queen's Dock Scheme. — The proposed purchase from the London and North Eastern Railway Company, for £117,000, of the Queen's Dock, was approved by a great majority when it was submitted to the City Council, only five votes being recorded against it. The closing and filling in of this, the oldest of Hull's docks, is strongly opposed by a section of the carrying trade, those interested in traffic by lighters, and there is little doubt they will make themselves heard when the Bill legalising it comes before the Parliamentary Committee at Westminster. The Chamber of Commerce was caught napping. The project had been under public discussion for some months, but they did not give expression to any opposition until two days before the meeting of the City Council, by which time nearly every member had been won over in its favour.

Oil Installation Extensions. — The British Petroleum Company, Ltd., have extended their storage capacity at Salt End, Hull's oil port, by constructing eleven additional tanks, with a total capacity of 48,000 tons.

Greenland Greyhound.—The "Waveflower," a trawler built for the Yorkshire Steam Fishing Co., Ltd., is claimed to be the world's fastest trawler. She is expected to develop 1½ to 2 knots per hour more than any rival. Her owners hope to be recouped for their outlay by the time she will save in bringing her catches from Greenland and Iceland. The added speed will enable her to make more voyages, and to land her fish in better condition.

Trolley Buses.—The Hull Tramways Committee is adhering to its decision to introduce trolley buses, and has decided to place an order for twelve of the Guy type. Some months ago they were unanimous on the point, and then one of the members re-opened the question. The General Manager claims that they are more reliable than petrol vehicles, and will show a saving of from 1¾d. to 2d. per mile. The district which the trolley buses were intended to serve, would, Councillor Stark declared, have three different types of vehicles, and four or five types of petrol buses, and he opposed the introduction of the trolley vehicle.

Humber Bridge or Tunnel. — The committee representative of the Hull Corporation and other public bodies in the East Riding of Yorkshire and North Lincolnshire, who are in charge of the scheme for tunnelling or bridging the Humber, have selected Sir Douglas Fox and Partners, consulting engineers, London, as their advisory experts. The firm are to prepare alternative schemes for affording transport communication between the East Riding and North Lincolnshire, in the vicinity of Hull, for rail, road and pedestrian traffic. The work is to be done in three months. So far as a layman can see, there are no great engineering obstacles to either a tunnel or a bridge. The really important point is the financial one. It would be difficult to find the necessary financial backing privately, but the advocates of the scheme hope the Government will undertake the work under their scheme for dealing with unemployment. The Ministry of Transport is contributing £2,000 towards the cost of the preliminary investigations and report.

Traffic Control at Paignton.—Paignton U.D.C. has received a communication from the Chief Constable of Devon intimating that he had made arrangements for a traffic warden to be employed at Paignton during the winter months.

South Wales Notes.

FROM OUR OWN CORRESPONDENT.

Llanelly Conversion to Buses.—The Llanelly Electric & Traction Co. is to accede to the Borough Council's suggestion that it should scrap the tramways system and adopt buses instead. The Company has decided to substitute trolley buses, railless, for the trams, and to make the change over as soon as possible to complete it before the 1930 Welsh National Eisteddfod which will be held in Llanelly.

Newport Too?—At a special meeting of the Newport (Mon.) Town Council it was reported that, as anticipated, the Government departments, in arranging with the Newport (Mon.) Council for the immediate carrying out of the widening of the Newport stretch of the London-Fishguard road, viz., the reconstruction of the Chepstow Road in Newport, and construction of roads to carry this through to the Cardiff Road, had given the Council to understand that it expected that the tramways system on Chepstow Road would be scrapped and other system of passenger carrying adopted. The Council has received a report from its officials on three alternative transport systems to trams, viz., on the Chepstow Road only, on the Chepstow Road and on the new road routes, and on the whole of Newport routes. For the first, petrol buses are suggested; for the second, trolley buses or petrol buses; and for the whole substitution of trams, trolley buses, except for Corporation Road and Stow Hill routes, for which petrol buses must be provided. The report, whilst calling attention to the serious factors against present-day tram scrapping at Newport, appears to favour whole hog scrapping of trams, if any scrapping is to be done, as the change of systems in town, from buses to trams, would be inconvenient in operation and to passengers, if one part of the system only was changed to buses. The Council has to make early decision on the question of scrapping and extent, if any, in order not to miss the opportunity of gaining sanction thereto. It has been definitely decided (on October 30th) to scrap Chepstow Road trams and run trolley buses. The decision on remaining routes is deferred.

Amalgamation.—The Western Welsh Omnibus Co., Ltd., has acquired the Mid-Glamorgan services of Messrs. Cridland, Port Talbot. Messrs. Cridland have operated for a number of years at Port Talbot, Aberavon and Bridgend, and surrounding areas, and some twenty-four buses were licensed for them by local authorities, to whom the acquiring company has applied for transfer of licences. The Western Welsh Omnibus Co., Ltd., also proposes to extend its Bridgend bus station very considerably. The G.W.R. Co., one of the constituent companies of Western Welsh Omnibus Co., has arranged a close co-operation between its services and those of Messrs. Ralph's Garages, Abertillery. The companies will co-ordinate time-tables, and will arrange that tickets issued will be available on either company's buses.

Employees Social Welfare.—It is understood that the G.W.R. Co., in addition to building a new town-centre welfare hall for its bus and tram employees at Cardiff, is to erect at Rogiet (Mon.) a welfare institute for its Severn Tunnel area employees.

To Ensure Fair Licensing.—The Blaenavon U.D.C., one of the constituents of the East Mon. Joint Authorities Bus Licensing Board, has passed a resolution that none of its members having interest in any bus service, or being employees of a bus company, or having relatives so employed, shall sit in consideration of bus licence applications, and has urged the Joint Board and the other constituent authorities to pass a similar resolution aiming at unprejudiced licensing deliberations.

Cardiff's New Garage.—The Cardiff City Council is to erect and equip a new bus garage and workshops to house 120 buses at Sloper Road.

Long-Distance Carrying.—Several of the long distance daily bus-coach services between South Wales and English centres are making large cuts in the number of daily journeys in view of the winter advent. A few long-distance services have been suspended altogether during the winter, and the influence of the season on trade is very marked. On the other hand, area inter-town services, whilst somewhat modifying time-tables for the darker evening hours, report trade to be showing constant improvement, due, no doubt, to the slow, but steady industrial recovery, and more especially to the absence of industrial stoppages through domestic disputes.

Removal and Haulage Trade.—Whilst removers report trade to be "steady," they state that competition is very keen and prices are not as stable as they might be. The haulage trade is showing constant improvement, particularly in the Western area, where some contractors report business as "brisk."

Scottish Notes.

FROM OUR OWN CORRESPONDENT.

Road Transport in Glasgow.—Several conferences have taken place between representatives of the Glasgow Tramways Committee and representatives of the railway companies on the question of ownership and control of road transport in Glasgow and the West of Scotland. So far no agreement has been come to, the point at issue being a claim by the Corporation for a complete monopoly within the area at present covered by the tramway system. The railway companies are only prepared to recognise a civic monopoly within the boundaries of the city and an equal sharing of the transport beyond the boundaries. The trams cover a very extensive area outside the city boundaries.

Aerodrome Sites.—Inverness is the latest town which is interested in the erection of a civil aerodrome. A representative of the Air Ministry has made an examination of various sites proposed. Over twenty towns in Scotland are interested in such a project but not all of them can conform to the requirements of the Ministry. In regard to the actual equipment necessary the Ministry does not require any local authority to lay down expensive equipment because in the first instance this would not be necessary. Naturally, go-ahead municipal bodies are very keen on this subject as they realise that in the near future air transport will expand and become an important public service.

Tramway Pioneer Honoured.—Ex-Bailie Peter Burt, who has been a prominent figure in Glasgow's civic life, was entertained to a dinner which marked his retirement from the convenorship of the Tramways Committee. Many officials of the Corporation were present and Bailie Park paid a tribute to their guest who had influenced the carrying out of many important reforms for the benefit of the city. Mr. Burt was a member of the small committee appointed to bring about the municipalisation of the tramways in 1894. When the trams were electrified there was considerable opposition, and a section of the Corporation actually wanted them to operate a cable system instead of the overhead traction which had proved so successful. Bailie Burt is confident that the tram will justify itself as against the bus and that with improved vehicles and increased speed it will be as successful in the future as it has been in the past.

New Wishaw Garage.—Messrs. Stewart & MacDonald, the well-known Lanarkshire bus firm, are building a new and spacious garage in Stewarton Street, Wishaw. The building will occupy a large frontage extending to 150 feet. Business offices and mess room accommodation for the staff are included in the plans.

Petrol Pumps.—The great increase in the number of petrol pumps is mentioned in the report of the Chief Inspector of Glasgow, who states that twenty years ago there were only 366 persons authorised to store petroleum spirit; now in addition to 1,070 licences 182 firms keep petroleum for motor car purposes without licences, but under the regulations of the Home Secretary. In the city there are 614 specially constructed underground tanks, the capacities of which range from 300 gallons to 12,000 gallons—operated in every instance by a connected overhead pump. Compared with storage in tins, drums or barrels, the underground system of storage, especially where the quantity is large, is undoubtedly the safer system, says the report.

Steam Waggon Accident.—An alarming accident in which a steam waggon was involved happened in Stirling. The vehicle, which belonged to the Universal Transport Coy., Dundee, collided with two stationary motor lorries, skidded across the street and demolished a wall. The impact was so severe that the boiler exploded. The fireman was badly scalded about the neck and he succumbed to his injuries in the hospital. The driver had a fortunate escape. The noise of the explosion created great excitement.

Northern Ireland Notes.

FROM OUR OWN CORRESPONDENT.

More Trams for Belfast?—The Tramways Committee of the Belfast Corporation have decided to consider the question of the purchase of fifty additional tramcars.

Municipal Garages.—With a view to relieving the situation caused by lack of sufficient parking facilities for cars, the Belfast Corporation have decided to seek, in a Parliamentary Bill, powers which will enable them to acquire lands and premises for use as motor garages. The Bill has not yet been drafted, and as it will contain a number of controversial matters, it may not go to Parliament in the form in which it is now foreshadowed. But the Police Committee of the Corporation have inspected a large block of buildings in Smithfield with a view to acquiring them. These consist of a weaving shed and a block of mill buildings containing four stories. The space available was more than an acre, but the City Surveyor has declared the buildings to be unsuitable, and there the matter remains for the present.

Belfast Air Port.—Another provision in this proposed Bill is to enable the Corporation to subscribe £200 per year for not more than fifteen years towards the rent of an air port on the Harbour Commissioner's estate. National Flying Services, Ltd., proposed to utilise a large tract of reclaimed land at the entrance to Belfast Harbour, adjoining Belfast Lough, but there was a difference of some hundreds of pounds between what the Harbour Board would take as rent and what National Flying Services wished to pay. The Corporation proposal is an effort to get over the difficulty

Irish Free State Notes.

FROM OUR OWN CORRESPONDENT.

Motor Vehicles in the Irish Free State. — In August last, there were 50,538 motor vehicles in the Irish Free State, as against 47,065 in August, 1928. Of these, 7,209 were commercial motor vehicles as compared with 6,496 in August last year. There were 5,598 motor hackneys, not exceeding six seats, being 73 less than in August, 1928, and 705 buses and chars-a-banc, or 13 less than in August, last year. There were 29,435 private motor cars, and 7,591 motor cycles—the former showed an increase of 3,108 as compared with August, 1928, and the latter a decrease of 262.

Need for Additional Bus Services in the Irish Free State.—That there is need for additional bus services on the roads of the Irish Free State is the opinion of a well-known Irish motorist, and in the course of a letter to "The Irish Times," he gave his reasons for thinking so. The motorist, Mr. H. Neville Roberts, of Dublin, in the course of his letter, said: "I have made a circuit of Ireland by road ten times during this summer, covering approximately 12,000 miles. The excellence of the roads is indisputable, in the North as well as in the South, the only exceptions being in Connemara and in the remoter parts of Kerry, Clare, and Donegal. In Northern Ireland, the roads are being used as a means of transport, and carry an adequate and increasing service of buses linking towns, villages, holiday resorts and countryside. This service does not come from railway enterprise or railway monopoly. In the Free State, one wonders if the excellent motor roads are intended as ornaments, or if they are kept for the convenience of cattle, driven or straying, and for the passage of the ass-drawn cart that is still the chief link between countryside and country town. The main roads throughout the Irish Free State were surely constructed for motor traffic, at the public expense, and they could certainly carry ten times the present volume of transport without any approach to congestion. One of the most urgent needs in the Irish Free State is an adequate road service, both for passengers and goods, such as Northern Ireland enjoys."

Importations of Motor Vehicles into the Irish Free State.—From the Irish Free State Trade Returns, issued by the Statistics Department, dealing with exports and imports during the first eight months of the present year, it appeared that 795 motor commercial vehicles, of the value of £147,153, were imported into the Free State from 1st January to 31st August, 1929; 5,687 motor touring cars, of the value of £883,379 were imported in the same period, and tractor parts to the value of £451,570. On the other hand, tractors to the value of £774,270 were exported from the Free State during the first eight months of the present year. These latter figures afford some idea of the activities of the Ford factory at Cork, from whence finished tractors are being regularly forwarded to various foreign countries from Cork.

Law Cases.

PLYING FOR HIRE.

BEFORE Mr. R. Vaughan Williams, K.C., the Recorder, at Swansea Quarter Sessions, appeal was made by Messrs. Griffiths & Son, bus proprietors, Craigcefnparc, near Swansea, against a conviction and fine imposition by the Swansea Stipendiary Magistrate, for alleged plying of buses for hire in Swansea without the sanction of the borough council.

The grounds of appeal were that the conviction was wrong in law and that it was against the evidence and the weight of evidence in fact, that these had been plying for hire.

For appellants, were Mr. Paley Scott, K.C., and Mr. Jenkin Jones, and for the respondents, the Swansea borough council, were Mr. Trevor Hunter, K.C., and Mr. Valentine Holmes.

For respondents, it was stated that the prosecution had been conducted in June for an alleged offence in February, to test whether what the bus proprietors considered a sound and legally watertight system of private hire, was so in fact. The prosecution contended it was plying for hire. Defendants ran a system of buses known as Eclipse Saloon Services, from Craigcefnparc and other places outside the borough, into Swansea. They had a garage at Swansea which was the terminus and starting place for return journeys. There was exhibited a regular time-table for the services which were regularly run, and over a good part of the route in Swansea area. Defendants issued daily and period return tickets and season tickets. These tickets could not be bought in Swansea, and had to be procured outside the borough, and no passengers would be admitted to the buses in Swansea who were not already in possession of such return tickets. Nevertheless, the prosecution contended that it was possible for a person resident in Swansea, to go outside and procure a period, season, ticket and use it wholly within the borough, viz., to travel between his home and town centre. The fact that a good part of the route lay in the borough, that the buses, a distinctive service ran regularly and to time-table, which could be consulted by anyone, amounted in prosecution view to solicitation of passengers and plying for hire.

Evidence in substantiation of prosecution case was given.

A Swansea clerk deposed to, outside the borough, obtaining a season ticket which he used wholly in the borough to travel to and from his home into town.

The case for the appellants was that the evidence did not show or prove plying for hire. The tickets, all returns, were issued outside the borough, and there was no solicitation of passengers in the borough. It was not an offence in law, it was contended, to carry out from Swansea, people who were carried in on appellants' buses, and who, by their possession of a return ticket, held a contract with the company to be carried home in the company's buses. The issue of period return tickets was not unlawful, and did not mean plying for hire, but pre-contract for a period. Counsel contended that nothing was done to establish plying, and the system clearly showed defendants' aim to bring people from outside the borough into Swansea and carry them out again. It was a vital matter that this system should be sustained. Counsel commented upon the unsatisfactory state of the ply for hire licensing law. They had in 1929, only the eighteen years old Act to govern this plying and licensing, and plying was now a different thing to when the Act was framed, both as regards fact and volume and its import to the public.

The Recorder, giving judgment, said he would dismiss the appeal with costs against appellants. His detailed judgment he would give later. He would now say that he held there had been plying, and that a good part of the business of these coaches was plying in Swansea. The fact that a time-table could be consulted, that the vehicles ran regularly, that the buses were of one distinct colour and name, and that a great part of the route was in Swansea, all made him take this view. These facts, with destination boards to coaches, constituted solicitation.

USING A MOTOR LORRY WITH A LIMITED TRADE PLATE.

IN the District Court at Cork before District Justice D. B. Sullivan, B.L., Thomas Magee, of West Street, Drogheda, County Louth, was summoned for having on July 3rd, in Cork City, used a motor lorry with a limited trade plate for the carrying of goods. Civic Guard Roche stated that he stopped the lorry in Coburg Street, Cork, and found in it some Ford parts, and two 28-lb. boxes of butter. The driver said he knew nothing about it, and that it was not his fault. He was taking the lorry, which was a new one, from Ford's works at Cork, to Magee's garage in Drogheda.

Mr. A. Curtis, an official of the Clerk of the Court's Office, stated that a letter was received from the defendant stating that he could not attend the court as the expense would be very considerable. Although the limited trade plate was displayed, the ordinary licence was actuallly purchased on July 1st, and the tax paid in respect of the new owner.

Civic Guard Superintendent Butler said that what probably occurred was that the owner subsequently took out the licence as from July 1st.

The defendant was fined 20s.

TRANSPORT CONTRACTORS LOSE CURIOUS ACTION.

A CURIOUS action was decided by Judge Cluer in the Shoreditch County Court, when Richard James Weeks, of 28 London Lane, Hackney, transport contractor, sued Messrs. Gilbert & Robinson, of 58 Mansford Street, Hackney Road, E., wireless cabinet manufacturers, to recover £9 14s. 10d. transport charges. The charge was for:—February 28th, motor lorry to Bristol at 6½d. per mile, £7 1s. 11d.; March 1st, five hours motor van in London, £1 2s. 6d.; and March 2nd, 6¾ hours, £1 10s. 5d. The defence was that the defendants knew nothing whatever about the hiring, and did not order same.

Mr. Cloutman, barrister, appeared on behalf of the plaintiff. The plaintiff gave evidence, and said that a man named Cole, employed by the defendants, came to him and said he wanted a lorry to go to Bristol the next day to deliver wireless goods, and he agreed to let him have one at 6½d. a mile. On returning from Bristol, with Reeder, their own driver, Cole said they wanted a van for the next day for London, which he supplied, and again the next day. He got the tickets filled in and they were signed for by Cole. The accounts were then sent in to the defendants, and a fortnight after the work was executed, Mr. Gilbert called upon him and told him that he had not ordered the van, and that Cole had no right to have done so off him. Mr. Gilbert further said that their van went out of order, and he told Cole that if he did not want to be out of work, he could hire his uncle's van at 10s. a day. The plaintiff went on to say that so far as he was concerned he had no idea otherwise than that he was doing the work for the defendants. Judge Cluer, at this point, said that on that evidence the defendants had no case to answer, whereupon Mr. Cloutman said that the main point in the action was the acceptance of the service by the defendants. He argued that no reasonable firm could expect to hire a motor lorry to Bristol and back for 10s., and that therefore they had accepted the service of the plaintiff and were liable, but Judge Cluer disagreed with this view entirely, and said that one man might do him a service for a shilling which someone else would want to charge several shillings, and if he had instructed his man to go and engage the shilling man, the employee had gone outside his duty if he had gone and engaged the several shilling man, and there could obviously be no contract with him. There was no reason for the defendants to suppose other than as he had said ten shillings a day from the uncle of Cole, that this was the van. The question was, really was it within the general authority of Cole to hire this van, and the answer was obviously "no," only to hire one from somewhere else at 10s., and if there were an implied contract of service for 10s., it could not be within his power to hire a lorry costing £7. Mr. Cloutman submitted, however, that if the defendants accepted the service, there was an implied undertaking to pay a reasonable sum, but Judge Cluer disagreed with this, and said they were not called upon to pay it because they had not accepted the service from the plaintiff. Clearly Cole had gone outside his authority, and it might be the uncle's 10s. van for all the defendants knew. Judge Cluer said he would have to enter judgment for the defendants, with costs.

A POINT TO BE NOTED BY BUS OWNERS.

A CURIOUS point as to whether the procedure adopted amounted to plying for hire was decided by the Cardiff stipendiary magistrate when Imperial Motor Coy., Abercynon, were summoned for having plied for hire in Cardiff, without a licence.

A police officer said he boarded the bus, which was labelled "Aberdare," at Cardiff, and was asked by the bus conductor to produce a return ticket, and he replied that he hadn't one. The bus conductor ordered him off the bus, but told him to get on to a locally licensed bus and travel to the Philog, the borough boundary, where he could could get on the Aberdare bus, and allowance would be made for the 2½d. local fare off the 1s. 9d. return ticket, Cardiff-Aberdare, which was issued to him beyond the borough boundary. This was done.

Another officer said that when he interviewed Mr. Howell Morgan Davies, proprietor of the service, he said he had

Digitized by Google

given his conductors strict instructions not to ply for hire in Cardiff.

For the defence it was urged that as the passenger was not carried in the city area, no offence had been committed. The rebate of the 2½d. spent by the officer in getting beyond the boundary was quite admissible and did not make the company pliers in Cardiff. They could pick up beyond the borough, and simply made an allowance for the part of the journey, Cardiff-Aberdare, within the borough, which they could not carry in, and in which the officer did not travel with them. The proprietor had no knowledge of the transaction.

The prosecution contended that by arranging to pick up the fare beyond the boundary, the conductor had solicited a passenger and plied for hire.

After considerable discussion, the stipendiary held that an offence had been proved, and fined the proprietor 40s. and costs. The driver and conductor were each fined 10s. for aiding and abetting.

LAW ON STRAP-HANGING.

WHEN several bus conductors were fined in Manchester for allowing more than four passengers to stand, one of them said: "You never know where you are."

The case was one of particular interest to the proprietors of motor buses because of the decision of the magistrates on September 11th, that only four passengers may be allowed to stand. This was based on Section 2 of the Railway Passengers Duty Act of 1842, which says: "Stage carriages are not to carry either in the whole, or inside or outside, a greater number of passengers than they are constructed to carry as ascertained by Section 13." The accommodation required under Section 13 is set out as follows:—"Fit and proper seats must be provided, allowing for every passenger on an average space of 16 inches measuring in a straight line lengthwise on the front of each seat."

The defendants were in the service of the Manchester Corporation, Bolton Corporation and private companies. An impression has apparently become prevalent among many bus conductors, that six extra passengers could be allowed to stand. This impression was created by the fact that police prosecutions hitherto have been confined to cases where more than six passengers have been standing. Now, however, the police have proceeded in cases where six extra passengers had been carried.

To the defendant, who said, "You never know where you are. We were told we were all right so long as we did not carry more than six extra," the Clerk of the Court replied: "Certainly, the position is difficult. One cannot help having a little bit of sympathy with you in this matter."

One of the magistrates, Mr. Bailey, said that neither the Bench nor the police had permission to allow more passengers to be carried than a vehicle is licensed for. They were not there to make the law but to administer it.

It was then declared by Superintendent Palmer that the police did not prosecute in cases where only four extra passengers were carried. A certaiin amount of discretion was exercised.

MECHANICAL BREAKDOWN OF A CHAR-A-BANC.

IN the Shoreditch County Court, on October 29th, before Mr. Registrar Wickham, Mr. David Kingberg, of 7 Watney Street, E., a wine and spirit merchant, sued Mr. Albert Ewer, of 152 Curtain Road, E.C., a char-a-banc proprietor, to recover £4 paid under protest for a char-a-banc to Margate. In his statement of claim, the plaintiff said that he arranged in August for a char-a-banc outing with a party of his friends to take place on September 1st, to be at Margate at 1 o'clock, and be back the same day, he arranged with Messrs. J. Lyons & Co., down there for the catering. The price was to be £8, which he paid in advance. The char-a-banc broke down at Rainham, and they never went to Margate. He saw the defendant's manager with reference to it on September 4th, who said he was very sorry for the mishap, but he agreed that another char-a-banc should run on the 15th of the month without charge in substitution. A few days beforehand, however, he received an invoice for £4, and as he had no time to make any other arrangements he sent a cheque for this amount under protest. He rang the manager up, who told him that there ought to be a charge of some sort, "How would 50s. do?", but he told him that he would send him the cheque for £4 under protest.

In cross examination, the plaintiff said that at the time that he paid the £8 he knew nothing about conditions, but when he got the receipt he noticed that they would not be responsible for any mechanical breakdown, it being printed on the form. He agreed that a coach came to Rainham from Margate and offered to take them to Margate, but that was at 5 o'clock, and they would not have got there until 6 o'clock. He denied that at any time the manager said anything to him about a reduced rate being charged. He seriously suggested that despite the fact that it was distinctly said on the form that the defendants would not be liable for a mechanical breakdown, that the manager agreed to do the second journey for nothing.

For the defence, Mr. Risden, manager to the defendant, produced the book of the firm in which an entry was made for September 15th against the plaintiff for £8, but which he told the clerk to reduce to £4, being what he called a very reasonable reduced rate.

In cross-examination, he said he thought it was quite reasonable that the account should be sent in only three days before, because there were 5,000 char-a-bancs in London, and the plaintiff could easily have got another one elsewhere had he been so minded, despite the fact that it might have reasonably been called a record char-a-banc year. He had no recollection of mentioning anything about 50s., and had there been a question of no charge, it would have been in the ledger.

Mr. Hornby (for the defendants): If char-a-banc proprietors had to do their work over again every time there was a mechanical breakdown, they might just as well close down.

The Registrar: It seems to me to be no object in putting the notice on the receipt unless they intend it to be enforced. If he did not intend the conditions to hold, they would not have been printed. The plaintiff was bound by the first contract, and it is quite clear the defendant's manager never intended to run the second journey for nothing. There will be judgment for the defendant with costs.

BUS SPEEDING IN DUBLIN.

IN the Dublin District Court, before District Justice Cussen, James Doyle, bus driver, was charged by a Civic Guard with having driven a bus on Merrion Road at a speed of 28 miles per hour. The District Justice asked the defendant what speed his employer told him was the limit at which he might drive a bus in the city and surrounding townships? The defendant replied that he had not been instructed on the subject, but he understood that he could drive up to 25 miles an hour. The District Justice said that the defendant was wrong. The speed limit for Dublin and the neighbouring townships was 20 miles per hour, and he wished all persons connected with the bus traffic to understand that clearly. The overspeeding of buses was becoming a very serious matter, and was giving a great deal of trouble to the Civic Guards, as well as occasionally great risk to the public. He had stated before, and he repeated it now, that for the future, when bus drivers were brought before him for overspeeding, their licence would be endorsed on the first occasion, and either suspended or cancelled on the second. In this case he imposed a fine of ten shillings, or, in default of payment after a week, seven days' imprisonment. The licence would be initialled and returned to the defendant by post, but meantime he could continue to drive his bus. In three other cases for exceeding the speed limit similar fines were imposed on the defendants.

A Chevrolet truck climbs the Crystal Palace steps!

THE famous terraces at the Crystal Palace, where so many millions have congregated to see the fireworks displays, have, as a part of their construction, several series of steps of an incline of 1 foot in 2416. It was up these steps on Saturday, October 12th, that General Motors Chevrolet made six ascents and descents under the official observation of the R.A.C.

THE CHEVROLET CLIMBING THE STEPS AT THE CRYSTAL PALACE.

These climbs were staged as a demonstration of the power of the fourth or caterpillar gear of the Chevrolet-Six, and as a further demonstration of the efficacy of the springing and the brakes.

The Crystal Palace authorities, when giving permission for the demonstration, insisted that the full weight of truck and load should not exceed two tons, this being the limit of weight that in their opinion the steps would bear without the possibility of damage. In consequence of this, 10 cwts. of sand and sacks of hay were placed on the truck.

The first attempt was made promptly at 2.30 p.m. before a crowd of about 250, consisting in the main of dealers and transport users. The truck performed the task without effort, and another climb was made at 2.45 before a larger congregation of people.

Three further ascents and descents were made before 5 p.m., and the final effort was made at 5.45 p.m., at the termination of the dirt track meeting. Announcements had been made by the dirt track authorities, both in the programme for the day and by means of the broadcast installation, resulting in the majority of the spectators moving to the side of the steps. In deep dusk, the truck performed the final climb before at least 10,000 people, the only lights observable being those of the Chevrolet.

As the trial was observed by the R.A.C., all the usual investigations were made to satisfy the authorities that the truck was a standard one. Six climbs were decided upon to add to the severity of the test and to demonstrate that the capacity to accomplish the feat was not a freak occurrence. Each attempt was accomplished without difficulty or mishap. There was no alteration in the load, no adjustment was made, and no change of any description whatsoever from before the first climb until after the last.

It was an unusual and extraordinary sight to see this standard truck climbing these steep steps without effort; it was interesting to see it stopped on the steps and started again without difficulty to complete the climb; it was as interesting to see it stopped during its descents by the foot-brake alone, and then allowed to continue the descent.

General Motors are endeavouring to discover facilities for making a similar test, or even a more severe one, with a fully loaded Chevrolet Six, and intend inviting the official observation of the R.A.C. when they have discovered the essential site.

The Tasker Six-Wheeled Trailer.

TASKERS of Andover, Ltd., Waterloo Iron Works, Andover, Hants, have recently produced, to the order of Pickfords, Ltd., the six-wheeled or bogie low loading trailer shown in the accompanying illustration. It is intended for the transport of 10-ton loads. The length of the trailer is 16 feet, and the height of the top of the frame from the ground 2 feet 6 inches. The wheel track is 5 feet 10 inches, overall width 7 feet 3 inches, the nominal wheelbase is 8 feet, and the bogie wheelbase 2 feet 6 inches.

THE TASKER SIX-WHEEL 10-TON LOW LOADING TRAILER.

The rear bogie is of simple construction, and is built under the main frame, and carries the ends of the rear springs, which are positioned between the rear carriage members in order to give a low chassis. There is a single semi-elliptic spring on each side of the chassis, the undersides of which are secured to a square section steel axle. The front ends of the springs are pivotted, and the rear ends are shackled. Each pair of rear wheels is carried in a tilting frame consisting of 1-inch steel plates, one on the outside of the wheels and one inside, the two being separate by a distance tube. The tilting frame thus formed is pivotted on the end of the rear axle.

The front axle also is of square steel carried from the fore-carriage by two semi-elliptic springs, also accommodated between the longitudinal members of the fore-carriage. The frame work of the fore-carriage consists of four members of channel steel well braced. The turn-table frame is also of channel steel. The six wheels are of cast iron, and are carried on ball bearings and they are fitted with twin Poppe solid tyres of 22 inches by 5 inches section.

All rear wheels are fitted with internal expanding brakes properly balanced. The brake is applied by a wire rope from the towing vehicle or alternatively by a hand wheel for use when the trailer is stationary. The main brake cable passes through the hollow of the King pin, and does not affect the tension when turning.

Lubrication throughout is on the Tecalemit Zerk grease system with the grease gun nipples accessibly placed. The main frame is constructed of channel steel longitudinal and cross members, well braced together with M.S. plates.

Parking Place Attendants.—At the Parking Committee of the Torquay Corporation the superintendant of police stated that he favoured the employment by the Corporation of official parking place attendants instead of the practice now in operation at certain parking places in the highway where men undertake with the owners to take care of the cars during their absence. The superintendent had received several complaints of larceny at parking places during the past season.

Railways and Bradford Corporation.—The Tramways Committee of the Bradford Corporation has considered a communication from the London, Midland and Scottish and London and North-Eastern Railway Companies regarding their proposals to operate motorbus services on various routes to and from the city, and their desire to collaborate with the Corporation in the matter. A special sub-committee was appointed to consider the proposals, with power to negotiate with the railway companies.

Motor Notes.

A Tilling-Stevens All-Weather Coach.—The accompanying photograph shows a 30-seater all-weather coach, fitted with a roll-up head, and is in the service of Holt Brothers (Rochdale), Ltd., Weir Street, Rochdale, Lancs. This Company operates a fleet of motor coaches and omnibuses

ONE OF TILLING-STEVENS 30-SEATER ALL-WEATHER COACHES.

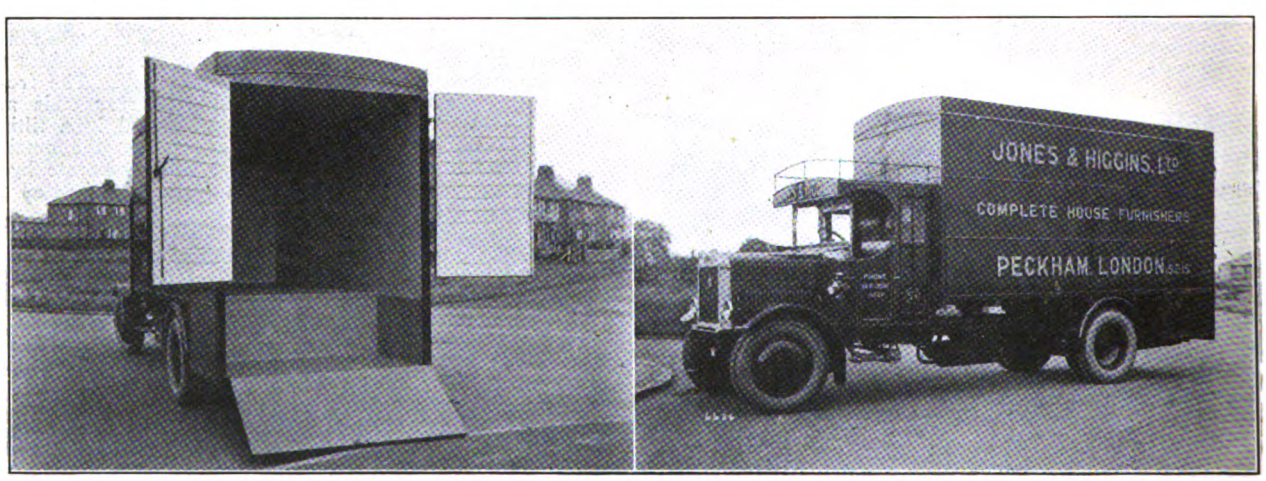
known as the "Yelloway Services," between Oldham and Blackpool, Manchester and Blackpool, and Blackpool and London. The bodywork was constructed by the Warwick Body-building Company, of Warwick Works, Old Trafford, Manchester, and the complete vehicle was supplied through the agents, of Tilling-Stevens Motors, Ltd., for Lancashire, Messrs. Garlick, Burrell & Edwards, Ltd., of Liverpool and Manchester. The chassis is the Tilling-Stevens "Express" gear driven chassis for single-decker service. The following is a list of users of this type of chassis:—The Eastern Counties Road Car Co., Ltd.; East Kent Road Car Co., Ltd.; East Yorkshire Motor Services, Ltd.; Maidstone and District Motor Services, Ltd.; Midland General Omnibus Co., Ltd.; North Western Road Car Co., Ltd.; Scottish General Omnibus Co.; Southdown Motor Services, Ltd.; Thames Valley Traction Co., Ltd.; Thos. Tilling, Ltd.; West Yorkshire Road Car Co., Ltd.; Wrexham District Transport Co., Ltd.

B.E.N.-Myers Car Washer.—We are informed by B.E.N. Patents, Ltd., 92, Tottenham Court Road, London, W.1, that they have installed one of the B.E.N.-Myers high pressure car washers in the new main building belonging to the Parkside Motor Co., of Coventry, which was recently opened by Sir William Morris, the head of the great Morris organisation.

Sentinel Steam Buses in Africa.—The Super Sentinel steam bus with trailer, shown in the picture, is used for conveying native servants between the "locations" in which they live outside Blomfontein, and the town itself. The vehicle is fitted with pneumatic tyres.

A SUPER-SENTINEL STEAM BUS ON PNEUMATIC TYRES IN SOUTH AFRICA.

A Large Capacity Furniture Van.—A design and construction for increasing the capacity of furniture vans is clearly shown in our illustrations. Not only does this design of body permit of additional furniture being carried, but it also facilitates the loading of household goods into the van. The van has been specially built for Jones & Higgins, of Peckham, and it is mounted on a Leyland long wheelbase four-ton chassis which has been suitably modified by Leyland Motors, Ltd., Leyland, Lancs., for the special body which incorporates a large well at the back, the full width of the vehicle. To accommodate this well the chassis frame has been cut off close behind the back rear-spring shackle and a dropped frame extension added, suitably braced, somewhat similar to the arrangement for carrying the rear platform of a double-decker. This construction permits of the floor level of the well being as low as two feet from the ground. The well extends forward just over 3½ feet, and as it extends the full width of the body it gives a floor space of 4 ft. 6¾ in. by 6 ft. 11½ in. which forms a very useful step for loading furniture into the main portion of the van, as well as for accommodating household articles. The height from the floor level of the well to the main floor level is 2 ft. 4 in. and the height from the bottom of the well to the roof is 9 ft. 8 in. The

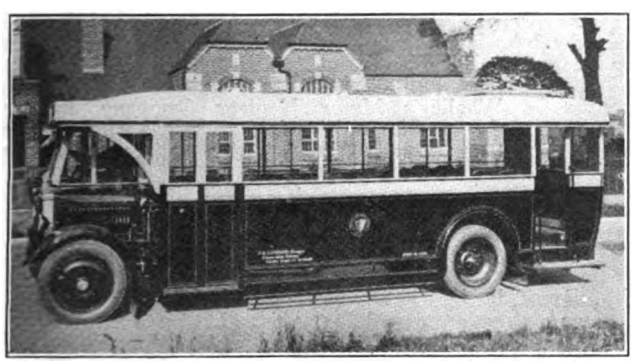


TWO VIEWS OF A LARGE CAPACITY FURNITURE VAN ON A LEYLAND LONG WHEELBASE 4-TON CHASSIS.

Digitized by Google

length of the body overall is 16 ft. 6 in. The rear doors of the van are in three portions, the lower portion being formed by a hinged tailboard which is locked by separate locks operated by a special carriage key on each side. This tailboard cannot be dropped until the two doors above it are opened. The two large doors are divided down the centre and swing back to the side of the body where they are held by special catches. Special locking arrangements have been provided on these doors. It will be noticed that the top of the cab is fitted with special luggage rails, access to which is obtained by a ladder on the side of the cab. The machine is finished in dark blue with the name of the user written in gold.

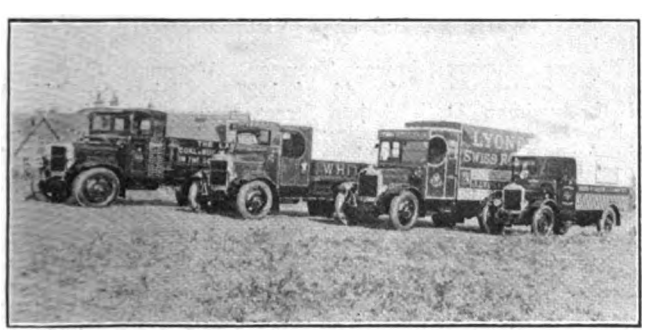
Guy Orders.—Guy Motors, Ltd., Fallings Park, Wolverhampton, announce the following recent orders:—A 19th repeat order from the War Office for 11 BAX 3/5 ton subsidy type chassis. The Premier Omnibus Co.,



A 32-SEATER COACH MOUNTED ON A GUY "OND" MODEL CHASSIS.

Ltd., Watford, a repeat order for a 30-seater chassis. Glico Petroleum Co., Ltd., a repeat order for a 2½ ton chassis. South Shields Corporation, a repeat order for a 32-seater complete bus. Walsh Graham, Ltd., a repeat order for 25 cwt. lorry. Orders and repeat orders for "OND" 20-seater coaches from Messrs. Burnells, of Weston-Super-Mare; Good's Garage, Seaton; St. Aubin's Motor Co., Jersey; Mr. J. Rowell, Mansfield; United Automobile Services, Ltd., Lowestoft; and G. N., Ltd.

Dennis Goods-Carrying Vehicles on Tour.—With the object of demonstrating the details of the most popular of the Dennis goods-carrying models, four completed machines left the works of Dennis Bros., Ltd., of Guildford, recently to carry out a tour of all the principal towns in the South of England, progressing subsequently northwards. This convoy—more familiarly known as "The Circus"—consisted of examples of Dennis vehicles supplied to John Barker (49), J. Lyons & Co. (32), Whitbreads (148) and Hall & Co. (32), the machines



THE DENNIS CONVOY.

being respectively, a 30-cwt. tilt van, 3-ton box van, 4-ton lorry and a 6-ton lorry. The figures in brackets after the names indicate the number of Dennis vehicles which have been supplied to each of these well known operators. Mr. J. Atkinson and Mr. E. Pollard were in charge of the convoy.

Dewar Trophy.—At a meeting of the Technical Committee of the Royal Automobile Club, held recently, Miss Violette Cordery was adjudged the winner for 1929 of the Dewar Trophy, which is awarded by the R.A.C. for the most meritorious performance in an official Trial. The Trial consisted of a 30,000 miles test of an Invicta chassis; it occupied 48 days; the total distance covered was 30,016.96 miles; the average speed (excluding standing time) being 61.57 m.p.h.

Premier Motor Policies for Commercial Vehicle Insurance.—Premier Motor Policies, Ltd., Glebe House, Sherborne Lane, King William Street, London, E.C.4, have for many years specialised solely in motor insurance, and they have a big business to-day which has been built up almost entirely on the question of first class claims service. The policies are guaranteed by the Eagle, Star and British Dominions Insurance Co., Ltd., and a special feature of the Commercial Policy issued by this company is the Cumulative Bonus Scheme which offers 10 per cent. the first year, 15 per cent. the second and 20 per cent. the third year. This, they find, is a great attraction to the commercial vehicle user as he is able to earn a steadily reducing premium in relation to his experience. The Company have a very fine outside organisation with branches from Southampton to Edinburgh, and they realise fully the necessity of dealing with commercial vehicle claims as quickly as possible with a view to getting the vehicle on the road again promptly. In short, they recognise the important fact that it is service that counts in the insurance business as in so many others.

The Victor Electric Vehicle.—Wingrove & Rogers, Ltd., British Electric Vehicles, Arundel Chambers, Strand, London, W.C.2, announce that they have recently delivered seven standard Victor electric chassis fitted with van bodies constructed to the Postmaster General's specification, to the Mount Pleasant Post Office, London, where they are in regular use for parcel delivery work. The purchase is in the nature of an experiment, but the firm are confident it will prove successful, as the work involves a limited daily mileage for which duty this vehicle is expressly designed. The vans themselves are by no means in the experimental stage, as a large number have been sold in various parts of the country for similar work. Victor Electrics are built in three sizes, namely, 20-cwt., 23-cwt., and 30-cwt., which capacities include the weight of the body. The prices respectively, are:—£143, £181, and £220, which prices do not include batteries. Batteries are fitted according to mileages required of them, the prices varying from approximately £67 for a 25-mile battery, to £212 for an 85 mile battery.

Scouts Jamboree.—Morris Commercial Cars, Ltd., Foundry Lane Works, Soho, Birmingham, were responsible for the official transport in connection with the Boy Scouts' World Jamboree, recently held at Arrowe Park, Birkenhead. The photograph shows one of these vehicles loaded with 2,000 loaves of bread.

A MORRIS COMMERCIAL AT THE BOY SCOUTS' JAMBOREE.

Enots Improved Hydraulic Jack.—Benton & Stone, Ltd., Bracebridge Street, Birmingham, manufacturers of the Enots Hydraulic Jack, include in their range Jacks specially designed for commercial vehicles. The "Enots" Commercial type Jack is supplied in Balloon or Empire models and is guaranteed to a dead lift of 3 tons. This means that a heavy bus or lorry can be adequately dealt with since only one wheel or at most one axle is usually lifted at any one time. The prices are:—Standard Model Balloon Type, 75/6; Geared Extension Model, 81/6; Empire Model, 75/6; Geared Extension Model, 81/6.

County Court Judgments.

THE following returns from the Registry of County Courts' Judgments, Whitehall, have been received relating to judgments entered up in the respective County Courts of England and Wales. Publication does not imply inability to pay. Many judgments may have been settled between the parties or paid. Judgments settled otherwise than through the Court may appear unless "satisfaction" is entered up within twenty-one days from judgment or allocatur. Registered judgments are not necessarily for debts. They may be for damages or otherwise, they may relate to actions *bona fide* contested between the parties, or they may be against defendants, liable in a representative capacity, and not personally; but no distinction is made on the register. Judgments are not returned to registry if satisfied in Court books within twenty-one days.

F. Ward (Thornton), Ltd. (243,423).—Private Company. Registered October 30th. Capital £800 in £1 shares. Objects: To acquire the business of motor engineers, charabanc proprietors, haulage contractors and gramophone dealers heretofore carried on by Fred Ward and Frances Ward at Thornton, Bradford, as "F. Ward." The directors are: Fred Ward, Mrs. Frances Ward (both permanent, subject to each holding ten shares). Registered office: 99, Market Street, Thornton, Bradford.

Hughes and Beattie, Ltd. (243,401).—Private Company. Registered October 30th. Capital £10,000 in £1 shares. Objects: To acquire the business of a livestock and general motor haulage contractor and of the Gilford Motor Vehicles Agency carried on by M. B. Hughes at Croft House, Wigton Road, Carlisle, as "Hughes and Beattie." The directors are: M. B. Hughes (permanent), Mary G. Hughes, E. F. Jackson, G. Dowell, J. Birkett. Registered office: Croft House, Wigton Road, Carlisle.

Kaye Transport Company, Ltd. (243,554).—Private Company. Registered October 31st. Capital £40,000 in £1 shares. Objects: To carry on the business of shipowners, carriers, etc., and to adopt an agreement with Kaye, Son and Co., Ltd. The first directors are to be appointed by the subscribers.

Blue Band Bus Services, Ltd. (243,535).—Private Company. Registered October 31st. Capital £8,000 in £1 shares. Objects: To carry on the business of proprietors and letters on hire of motor omnibuses, coaches, char-a-bancs, lorries, vans, wagons, etc. The directors are: J. F. Taylor, snr., J. F. Taylor, jnr. (permanent).

W. G. Marriott & Son, Ltd. (243,580).—Private Company. Registered October 31st. Capital £10,000 in £1 shares. Objects: To acquire the business of a licensed and general lighterman, barge owner, custom house and shipping agent now carried on by W. G. Marriott, Jun., at 9/10, Redriff Road, Rotherhithe, S.E., as "W. G. Marriott and Son." The directors are D. W. Marriott, W. G. Marriott, Jun., and W. H. Marriott. Registered office: 9/10, Redriff Road, Rotherhithe, S.E.16.

Mortgages, Charges and Satisfactions.

W. & J. Williams, Ltd.—Particulars filed of £1,000 debentures authorised September 5th, 1929, charged on the Company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Eniway Motor Tours, Ltd.—Particulars filed of £1,000 debentures authorised September 12th, 1929, charged on the Company's property, present and future, including uncalled capital, the whole amount being now issued.

Henry Green & Son (Haulage Contractors), Ltd.—Particulars filed of £4,000 debentures authorised October 1st, 1929, charged on the Company's property, present and future, including uncalled capital, the whole amount being now issued.

John M. Macgregor (Cartage), Ltd.—Mortgage debenture dated October 5th, 1929, to secure all moneys due or to become due to the chargees, charged on the Company's undertaking and property, present and future, including uncalled capital. Holders:—City of Liverpool Investment Company, Ltd., 6, Chapel Street, Liverpool.

Cook's Safety Coaches, Ltd.—Two debentures dated October 9th, 1929, to secure £2,176 11s. 10d. and £806 0s. 5d. respectively, charged on motor coaches and other vehicles, licences, licence duties, goodwill, book and other debts and moneys owing to the Company. Holders:—Johnson Neal, Ltd., 327, Harrow Road, Paddington, W., and Mrs. E. M. de Cardi, 1, Gunnersbury Avenue, Ealing.

C. Balch & Company, Ltd.—Debenture charged on the Company's undertaking and property, present and future, including uncalled capital, dated October 14th, 1929, to secure all moneys due or to become due from the Company to Barclays Bank, Ltd.

Associated Bus Companies, Ltd.—Debenture dated October 18th, 1929, to secure £3,000 charged on the Company's undertaking and property, present and future, including uncalled capital. Holders:—J. C. Mackenzie, Harmby, Boswell Street, Rotherham, and H. H. Granger, 3, Muskoka Avenue, Bents Green, Sheffield.

Marstons Road Services, Ltd.—Satisfaction to the extent of £700 on September 27th, 1929, of debenture dated March 5th, 1928, securing £4,000.

Bourne & Balmer (Croydon), Ltd.—Satisfaction in full on September 30th, 1929, of debenture dated June 21st, 1928, securing £2,000.

Receiverships (Appointment or Release).

A. Groombridge, Ltd.—A. J. Harper, of 35, Copthall Avenue, E.C.2, ceased to act as Receiver or Manager on September 30th, 1929.

Arthur Leach & Company, Ltd.—J. H. Jepson, C.A., of 18, Railway Road, Darwen, was appointed Receiver and Manager on October 10th, 1929, under powers contained in debenture dated July 27th, 1927.

Cook's Safety Coaches, Ltd.—A. H. Partridge, of 3, Warwick Court, Gray's Inn, W.C., was appointed Receiver and Manager on October 11th, under powers contained in debenture dated October 9th, 1929.

Transaerial, Ltd.—A. J. Harper, of 35, Copthall Avenue, E.C.2, was appointed Receiver and Manager on October 14th, 1929, under powers contained in debenture dated September 2nd, 1927.

The Road Traffic Bill.

With commendable promptitude the Government have introduced the Road Traffic Bill, and it has already passed its second reading in the House of Lords. Nothing is more disastrous to trade and industry than suspense, and for two years road transport has been in this dangerous position. The previous Government printed and issued a Draft Bill for the consideration of those directly interested more than two years ago, and naturally both manufacturers of motor vehicles and users at once attempted to foresee the trend of legislation. Nothing came of this step with the exception of the appointment of the Royal Commission on Transport. This body is to be congratulated upon the speed with which it has produced two reports, and the Government is to be congratulated on the rapidity with which they have produced their Bill, which Lord Russell, in introducing it into the House of Lords, described as a Bill founded on the Draft Bill, the comments and observances received upon it, and the two reports of the recent Royal Commission moulded into one coherent whole. The two reports dealing with the control of road traffic and the licensing and regulation of public service vehicles were thoroughly discussed at the Conferences held at Olympia during the Commercial Motor Transport Exhibition, and full reports of these Conferences appear in this issue. The Conferences of the Omnibus Owners' Association and the Motor Hirers' and Coach Services Association dealt exhaustively with the question of passenger vehicles, and the Commercial Motor Users' Association dealt fully with the control of road traffic, and we commend these reports to our readers. It is, therefore, not necessary for us to publish even an abstract of the Bill, but the more one considers it the less are those interested in public service passenger and goods carrying industries inclined to give it their blessing. It does appear to us a Bill for the private motorist rather than for those who have to earn their living by road transport. There is nothing in the Bill to make it easier for road transport concerns to operate, in fact, if it passes into law the small user will most certainly be squeezed out of the business—we refer more particularly to the passenger transport side of it. It is proposed in Part 5 of the Bill to give local authorities powers to run passenger vehicles both in and out of their own districts by agreement with adjacent authorities. The expression "local authority," it is explained, means the Council of a County, County Borough or County District. The proposal requires the most careful consideration, particularly by small operating firms, as, obviously, it is their welfare which would be most endangered. That part of the Bill relating to the licensing of public service vehicles is also most important from the small users' point of view, as there is direct relationship between it and the powers it is proposed to confer on local authorities to run vehicles outside their own areas. It must be remembered that there are very few local authorities of any importance, except County Councils, which are not now running their own services, and there is continual friction between them and private undertakings with regard to licensing. Since one of the objects of the Bill is to reduce competition, it is very obvious that these local authorities would use their power through the proposed district traffic commissioners to squeeze out the private user. It would appear that it would be only reasonable for the Bill to contain a clause for the protection of the small user in order that his business may not be ruined by the arbitrary method of refusal to grant annual licences. Long distance coaching also will be worked under difficulties, as it is proposed to give local authorities powers to make orders regarding the routes to be followed and as to stands and stopping places for such vehicles within their area. Clearly the tendency of the Bill is towards centralisation of control of passenger services, which may ultimately develop into either monopoly or nationalisation, two of the worst enemies the public can have, as they mean stagnation in the matter of improvement of vehicles as well as poor travelling facilities. The proposed speed limits also are retrograde, as they will decidedly handicap the development of road transport. It would almost seem that our governing bodies are ignorant of the fact that the motor

Digitized by Google

vehicle of to-day is a superb piece of mechanism, capable of speeds unattainable by any other class of vehicle used for land transport. Do they not realise that stupid legislation of this description is not only handicapping a great industry but it is actually handicapping the entire trade of the country and, indeed, of the Empire? These speed limitations and the differentiation between vehicles are nothing less than old womanish proposals. If carried into effect they will increase the danger of the road and reduce the efficiency of the vehicles. The maximum speed for the motor coach is 30 miles per hour—30 miles per hour for a vehicle easily capable of 60 miles per hour! Many motor cars habitually exceed this speed, and if the 30 mile per hour speed limit is observed all other road traffic will be either held up or the cutting in danger will be increased. Another absurdity of the Bill is that whilst 30 miles per hour is considered not a dangerous speed for vehicles laden with passengers, it is dangerous for vehicles laden with goods, unless the vehicle weighs less than 2½ tons. If the goods vehicle weighs not more than 2½ tons unladen it may travel at 30 miles an hour. If it weighs more than 2½ tons, 20 miles an hour is the proposed limit, or 16 miles per hour if drawing a trailer, these speeds being maximum speeds for vehicles fitted with pneumatic tyres. Five and eight miles per hour are the maximum speeds permitted for heavy and light locomotives respectively. These speeds might have been reasonable 25 years ago, but to-day they are absurd and as much out-of-date as the legislation the new Bill proposes to repeal. Another very serious clause is that which enacts that no driver shall remain on duty for any continuous period of more than five hours or for more than ten hours in the aggregate in any consecutive twenty-four hours. While it is generally recognised that the driver should not have to drive continuously for more than five hours, yet the ten hours on duty limit, if passed, would have a very serious effect on the goods-carrying road industry, because while the driver may be on duty at present for more than ten hours it does not follow that he is at work for more than half that time. The Government claims that the Bill is of a non-party character, but this does not mean that it is non-controversial, and the important associations connected with road transport in its various branches will fight strenuously to remove the objections which it contains.

Comment on Current Topics.

Public Ownership of Transport.

The subject of Transport is on everyone's lips and the chief topic of conversation not only in political circles but wherever business men are congregated. Not content with the introduction of the Road Traffic Bill, the Minister of Transport has now outlined in Parliament, although in a very nebulous form, his ideas for co-ordinating the whole of the passenger transport of London. The statement, which was authorised by the Prime Minister, was evidently intended to show the Government supporters that, having turned down and smashed the Bill which had almost passed through the previous Parliament to deal with the same subject, they had in their minds a much better and more comprehensive scheme of their own. As, however, the entire financial position has to be investigated, it is quite obvious that no Bill can be introduced for a long time to come. It is announced that the Government have retained Sir William McClintock, an accountant of high standing, to advise them on this side of the scheme. In the course of his statement, Mr. Morrison made use of a number of expressions which show that it is not the intention of the Government to nationalise transport as it had hitherto been understood, one expression he used being "the necessity for a single and simple form of public control." This statement is modified, however, by the further proposals that the principle of commercial management, in order to ensure vigorous business enterprise, is to be part of the plan. It is stated that the Government have in view a similar authority to the Metropolitan Water Board or the Port of London Authority. If this is the case it is certainly a far better arrangement than placing the transport of London in the hands of a Government Department with bureaucratic control, but, however, this may be, the crux of the matter seems to lie in that statement that the present interests are to be substituted by a single and simple form of public ownership. The great aim seems to be to eliminate competition and in this way to reduce the number of vehicles on the streets, and thus reduce congestion, but we are convinced that any such scheme will require most careful watching, as the elimination of competition inevitably results in monopoly, and finally in nationalisation as the ultimate outcome.

International Federation of Commercial Motor Users' Associations.

We give in this issue some brief particulars of a very important Conference, held last month in Paris, attended by associations of commercial motor users from seven countries on the Continent of Europe and from this country. At this Conference it was decided to form an International Federation of Commercial Motor Users' Associations, and we welcome this decision as tending to strengthen the position of road transport and because it forms an important link between the different countries by means of which difficulties can be considered and experiences can be exchanged and joint action taken as regards international transport. A number of important matters was considered and an auspicious start was made with what should prove a most valuable organisation.

The Washington Convention.

At the Conference of the Motor Hirers' and Coach Services Association, held at Olympia during the Commercial Motor Transport Exhibition, the secretary, Mr. R. P. Bailey, spoke about the Washington Convention and its probable effect on the road transport industry. We commend this report to the careful attention of all our readers who are concerned with road transport, in order that they may realise in time the need for effective intervention to see that road transport is treated as an exceptional trade and receives special consideration should the Washington Convention be put into operation. In this connection a Conference has been held between members of the Government, the Railway Companies and the Railway Trade Unions to discuss the matter as it affects the Railway Companies. Both the Companies and the Trade Unions were in agreement that the Convention as it now stands, could not be applied to railway work without producing chaos, and it is quite clear that the same criticism applies to the road transport industry, particularly that section which is concerned with long distance traffic. For instance, a driver may have to take his vehicle to a distance entailing three hours driving. He may then have to stand by for a number of hours while his vehicle is being unloaded and loaded up again and then have another three hours return journey, thus out of twelve hours time he would be working for six

Digitized by Google

hours and standing by for six hours. This is only a typical instance of road transport work. We understand that the interests involved are taking action in the matter, and it is well that all who are concerned and will be affected by such legislation should throw their weight into the balance and help the association to which they belong to protect their interests.

Rail and Bus Combines.

The co-ordination of road and rail transport has been proceeding apace during the past month, and a statement recently issued by Tilling & British Automobile Traction, Ltd., shows that the railway companies have now a strong financial interest in passenger undertakings, covering practically the whole of the Provinces. Sir Josiah Stamp, in giving evidence before the Royal Commission on Transport, dealt at length with this development and stated that while the railway companies owned among them in 1928 a total of 348 passenger motor vehicles, they were now directly interested in a fleet of approximately 8,000 vehicles. He stated that the railway companies had decided to become partners, so to speak, with existing undertakings rather than embark on an extensive road transport system of their own, which meant investing large sums of money, with a possibility of loss, and increasing the congestion on the roads. In addition to these arrangements, the railway companies have acquired a number of road transport undertakings out and out and have also made arrangements with one or two Municipal Corporations to take a substantial interest in their undertakings. It is stated that the various organisations will be under the same control and management, but it is quite evident that considerable modifications will be made in their working arrangements in order that road and rail transport services may be co-ordinated and work together, rather than in competition.

Notes and News.

Presentation Luncheon to Mr. Victor Brown, J.P., C.C.—On Friday, November 29th last, an interesting luncheon took place at Guildhall, the guest of honour being Mr. Victor Brown, the late Chairman of the Police Committee of the Corporation of the City of London. Mr. George H. Heilbuth, the present Chairman, presided, and the Lord Mayor and Sheriffs were present, and among a number of distinguished guests were Viscount Reading and Viscount Brentford. The Chairman, in a happy speech, speaking in high terms of the work done by Mr. Victor Brown during his year of office, made a presentation to him. This took the form of a beautiful ladies' wardrobe, and as it could not be given actually, a photograph was handed to Mr. Brown. A number of interesting speeches were made, including those by the Lord Mayor, Lord Reading and Lord Brentford.

MR. VICTOR BROWN, J.P., C.C.

L.N.E.R. Appointment.—Mr. O. H. Corble, whom we had the pleasure of meeting when we were in Newcastle recently, has been appointed Assistant to the Goods Manager, North Eastern Area, L.N.E.R., his headquarters being at York. Mr. Corble, who up to now has been Assistant District Goods Manager at Newcastle-on-Tyne, entered the service of the Great Northern Railway in 1908 and became Chief Clerk in 1921. After the groupage of the lines into the London & North Eastern Railway he was transferred to the Chief General Manager's Office and took an active part in an enquiry into the superannuation and pension funds of the company. During the War Mr. Corble held a Commission in the Royal Navy and served in destroyer flotillas both in the North Sea and the English Channel.

MR. O. H. CORBLE.

Great Western Railway Appointment.—Mr. S. B. Collett, of the Solicitor's Department, has been appointed Assistant Secretary of the Great Western Railway Company. Mr. Collett was educated at Bishop's Stortford College and was then articled to a firm of solicitors in Peterborough. During the War he served in the Royal Flying Corps, afterwards the Royal Air Force, proceeding to France in 1916 and attaining the rank of Captain. After the war he resumed his legal studies and became a member of the legal profession in March, 1922. He joined the Great Western Railway Service that year as a solicitor, and his legal experience will be of the utmost value to him in his new and important position.

MR. CYRIL M. PLANE.

Richard Garrett Appointment.—Richard Garrett & Sons, Ltd., of Leiston, have appointed Mr. Cyril M. Plane as Sales Engineer in connection with their Electric Trolley Bus business. Mr. Plane has been closely connected with the development of the Trolley Bus since its inception. He has had considerable experience not only in the design and manufacture of these vehicles, but also in superintending their installation.

Councillor F. G. Bristow.—Congratulations to Mr. F. G. Bristow upon his election unopposed as a member of the Westminster City Council for the Pall Mall Ward. Mr. Bristow's wide experience and great abilities should be of particular value to the Council and we congratulate this important body upon this addition to their strength. Mr. Bristow, who is General Secretary of the Commercial Motor Users' Association, is a Barrister-at-Law, a Fellow of the Chartered Institute of Secretaries and a Fellow of the Royal Statistical Society. He is also a Foundation Member of the Institute of Transport and the Institution of Automobile Engineers.

Obituary.—We regret to announce the death with tragic suddenness of Mr. Alec Jones, of Messrs. Jays, Southampton. Mr. Jones only took up an appointment as manager with Messrs. Jays a few days before his death. He was formerly

Digitized by Google

connected with the Pontypridd Furnishing Company, of Pontypridd, and was a valued member of the South Wales Centre of the Furniture Warehousemen and Removers Association, being for two years Chairman of the Centre.

Heavy Industries Fair.—In more marked degree each year the Heavy Section of the British Industries Fair becomes a national index of industrial enterprise. Not only will the 1930 display in Birmingham be of greater dimensions than ever before, but it is now evident that the new products to be introduced next February (17th to 28th) will be more numerous in proportion and cover a still wider range of industrial and domestic uses.

Great Western Railway Goods Department.—We have received from the Chief Goods Manager a copy of a new edition of their booklet dealing with the Country Cartage Services of the G.W.R. The booklet gives a list of stations from which lorry services operate at the present time, together with particulars of the collection and delivery charges for goods and parcels. The introduction states that these services are being extended so rapidly that it is anticipated that in the near future practically the whole of the territory served by the Great Western Railway will be linked up in this way. A copy of this booklet can be secured on application to the Chief Goods Manager, Paddington Station.

Fodens Visit Ferodo. — The Departmental Managers, Foremen and Staff of Fodens, Limited, Sandbach, visited Chapel-en-le-Frith recently and were entertained by Ferodo, Limited. During the afternoon a Bowling Match was arranged and played on the Ferodo

FODENS VISIT FERODO.

Green which resulted in a very close finish, the Home team scoring 310 against 293. Tea was afterwards served in the Works Dining Hall, and at the conclusion Mr. A. H. L. Thompson, on behalf of Fodens, Limited, made an appropriate speech expressing his appreciation of the very excellent reception, which was suitably responded to by Mr. Wm. Morris, Manager of the Manchester and Liverpool Offices of Ferodo, Limited.

Scammells and the New Ministry of Transport Order.—Speaking at the annual general meeting of Scammell Lorries, Ltd., Lieut.-Colonel Scammell referred to the recent order made by the Minister of Transport affecting articulated vehicles. He mentioned that representations had been made to the Minister by influential bodies as well as by his company, and there was now, he said, no fear that the order would be enforced retrospectively, although the whole matter was still under consideration. All vehicles affected by the order now in hand would be exempted, he said, whilst reasonable time would be given to clear existing stocks.

Commercial Motor Transport Exhibition.—The total paying attendance at the Commercial Motor Transport Exhibition, Olympia, was 64,802, representing an increase of 25 per cent. on the figures for the 1927 Exhibition. A few copies of the Official Catalogue of the Exhibition, which comprehends the technical details and prices of the Exhibits, are available and may be obtained post free for 1/6, on application to the Exhibition Manager, Society of Motor Manufacturers & Traders Ltd., Olympia, Kensington, W.14.

Institute of Transport. Forthcoming Meetings.—There will be an ordinary meeting of the Institute of Transport, at the Institution of Electrical Engineers, London, at 5.30 p.m. on January 13th next, when Mr. Ashton Davies, O.B.E. (former Member of Council), will read a paper entitled "The Co-ordination of Transport." There will be a meeting of the Newcastle-on-Tyne and District Section at the Y.M.C.A., Blackett Street, Newcastle-on-Tyne, at 7.30 p.m., on January 10th, when Mr. F. V. Wallis will speak on "Some Road Transport Problems."

Toy Balloon's Trip.—Three thousand miles across Atlantic from Manchester. A girl in Ontario, Canada, has found a Macinlop balloon which was released at Manchester in June. The balloon must have averaged about 1½ miles an hour on its 3,000 miles flight over the ocean. Another balloon released at the same time was found in Berlin, after travelling 650 miles, and a third landed at Maidstone, Kent.

Avon Tyres.—Recently Mr. Greenslade, of W. A. Greenslade, "Economy Trailers," Thomas Street, Bristol, accomplished the feat of driving a 14 h.p. Armstrong Siddeley touring car, with one of the firm's latest trailer horse boxes attached, from Beverley (Yorks) to Kelso (Scotland) and back in one day. The distance covered was 380 miles and the load consisted of two passengers in the car and Mr. E. V. Stephenson's Pasadina II. with groom in the trailer. The mare ran third in her race. Heavy rain was experienced all the way up and for 100 miles on the return journey. The car was equipped with Avon 765 x 105 tyres, and the trailer with Avon 5.00/20" (29 x 5.00).

An Unusual Load.—We illustrate an A.E.C. 6-tonner—one of a fleet operated by J. Deamer & Son, of Hitchin, Herts.—carrying an unusual load. This is a four-ton railway carriage body which had to be removed a distance of four miles. Although the loading of this presented no undue difficulties, setting it down in the middle of a field

A.E.C. 6-TONNER, ONE OF A FLEET OPERATED BY J. DEAMER & SON, CARRYING AN UNUSUAL LOAD.

called for considerable ingenuity. It was finally accomplished by tying one end of the carriage to a tree, propping it up with a pile of timber, and then drawing the lorry away until the other end of the carriage just rested on the end of the tailboard. This was likewise supported by a timber pile, the lorry driven completely away, and the carriage then lowered to its permanent bearers by means of jacks.

Motor Boats—Uruguay.—His Majesty's Consul-General at Montevideo reports that it is proposed to grant a concession for the establishment and operation of a motor boat service between the towns of Colonia and Buenos Aires. The notice (in Spanish) inviting tenders for this concession can be seen by interested firms upon application to the Department of Overseas Trade, 35, Old Queen Street, London, S.W.1. Reference No. A.X.8865 should be quoted.

National Horse Association of Great Britain. — At a recent Council Meeting of the National Horse Association of Great Britain, held at 12 Hanover Square, London, it was resolved to institute the award of a Gold Medal and illustrated certificate in all cases where great gallantry was exhibited in saving or attempting to save equine life. It was decided to award the first Gold Medal to Miss Queenie Brown of Tottenham, who recently rescued her pony from fire after dashing through flames into the stable. The Association has recently issued a statistical pamphlet on horse costs, which is available to all enquirers. The President stated that in view of the gratifying increase of membership and interest in the Association, a special Committee had been formed to nominate a President annually, and to recommend new members of the Council, thus ensuring that all horse and pony breeders and those in any way interested in the horse, should be represented on the Council.

National Pony Society.—Lieut.-Col. R. E. Cecil, D.S.O. (President), took the Chair at a recent Council Meeting of

Digitized by Google

the National Pony Society. The Chairman announced that the next National Pony Show would take place on Friday and Saturday, March 7th and 8th, 1930, at the Royal Agricultural Hall, Islington. Four new members were elected.

Automobile Electrical Association. — The Automobile Electrical Association, a new trade association, has been inaugurated in the interests of Automobile Electrical Service in Great Britain and Ireland. Membership is open to electrical repairers, but it is intended more specifically for the benefit of those who are interested in the servicing and repair of automobile electrical equipment. This is obvious from the conditions of membership, it being a rule that the Association shall be confined to those whose business is mainly that of servicing the electrical equipment of automobiles and other electrical services, but not engaged in the repair of engines, chassis or coachwork. Those of our readers who are interested should communicate with the Secretary, Automobile Electrical Association, 2 Tichborne Court, High Holborn, London, W.C.1.

The Hunters' Improvement and National Light Horse Breeding Society.—The Earl of Harewood (President) took the Chair at the Council Meeting of the Hunters' Improvement Society on November 14th, and proposed the election of 33 new candidates to the membership. Sir Henry Hoare, Bart., stated that the next Hunter and Thoroughbred Show would be held at the Royal Agricultural Hall, Islington, London, on March 4th, 5th, and 6th, at which the War Office would provide 15 classes for the exhibition of thoroughbred stallions competing for King's and Super Premiums to travel the country in 1930, and the Hunters' Improvement Society would offer 14 classes for Hunter young stock and riding horses.

A.E.C. Activities.—Amongst the orders received for their new range of passenger models, the Associated Equipment Company, Ltd., of Southall, announce a contract from the East Surrey Traction Co., Ltd., for 42 95 h.p. 6-cylinder "Regent" double deck bus chassis, and 18 95 h.p. 6-cylinder "Regal" single deck coach chassis. They have also been favoured with a contract from Messrs. Autocar Services for 18 "Regent" double deck bus chassis, and 10 "Regal" single deck coach chassis.

Change of Address.—The new works of Latil Industrial Vehicles Ltd. are at 11, Albert Embankment, London, S.E.11. The telephone number is Reliance 3337 (2 lines) and the telegraphic address is "Latiloads, Lamb, London."

New Zealand.—Steam Winch and Boiler.—His Majesty's Trade Commissioner at Wellington (Mr. L. A. Paish, O.B.E.) reports that the New Zealand Government Public Works Department is calling for tenders, to be presented in Wellington by the 28th January, 1930, for the supply and delivery of one steam winch and boiler for pile driving and general haulage work. Firms desirous of offering plant of British manufacture can obtain further particulars of this call for tenders upon application to the Department of Overseas Trade, 35, Old Queen Street, London, S.W.1. Reference number A.X. 8792 should be quoted.

A Useful "Commer."—We illustrate a 30-cwt. "Commer" delivered recently to a firm of Builders and

THE 30-CWT. "COMMER" REFERRED TO IN TEXT.

Contractors by Commer Cars, Ltd., of Luton. A drop-sided body with 12 in. sides it has a gantry with loose pegs on top rail. The appearance of this vehicle is very striking.

Night Assistance for Motorists.—Members of the Automobile Association are reminded that up-to-date information concerning roads which may be flooded, or districts in which fog is prevalent, can be obtained from the 24-hour Emergency Service maintained at the London A.A. Headquarters. Members in trouble on the road or in need of emergency assistance can obtain such help by 'phone (Regent 8000).

International Federation of Commercial Motor Users' Associations.

AT a meeting of delegates, representing commercial motor users' associations throughout Europe, held in Paris, on November 19th and 20th, it was unanimously decided to form an International Federation, to be called The Federation Internationale des Transports Commerciaux Automobiliers.

The countries represented were:—Austria, Belgium, France, Germany, Great Britain, Holland, Spain, and Switzerland. The delegates from the Commercial Motor Users' Association of Great Britain, were Mr. Geo. Monro, C.B.E., President; Mr. C. le M. Gosselin, President-elect; Mr. F. G. Bristow, F.C.I.S., General Secretary; and Mr. G. Arluison.

The meetings were presided over by Mon. Chas. Blum, President of the French Association, and a number of important questions were discussed at the second meeting, after having been handed to various delegations for consideration. These questions comprised—Railway Competition; Circulation over Frontier Regions; Standardisation of Chassis Sizes and Containers for different kinds of Goods; Various kinds of Fuel; Customs Questions; Drivers' Licences; Taxation of Commercial Motor Vehicles; Study of Tyres in Relation to Speed and Load.

It was resolved that the official headquarters of the International Federation should be in Paris, and Mr. Kundig (Switzerland) was elected the first President with three Vice-Presidents to be chosen from delegates from France, Holland and Spain, together with a Treasurer to be appointed by the French delegation. It was agreed that the governing body should be made up of the officers, together with one member from each country with a membership of less than one thousand, and two members where such organisations had upwards of a thousand members.

The social side of the Conference was not overlooked, and after the first meeting, a reception was held at the Palais de Luxembourg by Senateur Clementel. In the evening, the delegates attended a dinner under the presidency of Mon. Chas. Blum, and Mr. Geo. Monro responded to the toast of "The Guests."

At the conclusion of the Conference, Mr. Geo. Monro moved, on behalf of the Conference, a vote of thanks to Mr. Kundig, President of the Federation, for the way he had conducted the proceedings, and to Mon. Chas. Blum for organising the Conference and for the hospitality extended to the delegates.

At a subsequent meeting of the National Council of the British Commercial Motor Users' Association, it was decided to become a member of the International Federation.

Railways and Omnibus Companies.

A Far-Reaching Agreement.

THE following statement has been issued by Tilling and British Automobile Traction, Limited:—

The arrangements foreshadowed in July between main line railways and the largest group of omnibus companies in the provinces, have now been carried through. Standing joint committees to settle various matters relative to the co-ordination of road and railway traffic are to be set up at once in each district and the relative railways will acquire a substantial, though not a controlling, interest in each operating omnibus company.

The group at present controlled by Tilling and British Automobile Traction, Limited, together with certain companies controlled by British Electric Traction Company, Limited, to which the above statement refers, covers practically the whole of the provinces in England, together with parts of Wales and Scotland. Approximately 7,500 omnibuses are involved.

Bills in Parliament.

Applications to the Minister of Transport, etc.

FROM the viewpoint of the transport industry in London, obviously the recent announcement by the Government of the proposed co-ordination of London traffic undertakings overshadows in importance all other measures likely to be considered by Parliament in the forthcoming Session. No details of this scheme (which is to replace the London Traffic Bills dropped in July last), will be available for some time, but particulars are available of numerous Private Bills and applications to the Minister of Transport which affect the industry directly or indirectly.

There is a special Bill for enabling the London County Council to construct the much-discussed "Charing Cross Bridge," and incidentally to construct a temporary bridge, to abandon and remove certain existing tramways and to construct and work other tramways.

The London County Council (General Powers) Bill includes provisions for the extension of time for completion of widenings and improvements authorised by the Mall Approach (Improvement) Act, 1914, and the L.C.C. (Tramways and Improvements) Act 1920.

The Lancashire County Council seeks power to constitute a "Traffic Board" and "Area Committees," with powers to licence public service vehicles carrying passengers on roads or certain roads, within the county, and the drivers and conductors thereof; to prohibit the running of public service vehicles within the County without such licence, to attach conditions (including age, capacity to drive and adequate insurance) to any licence, to prohibit public service vehicles being left unattended, and to make various regulations concerning such vehicles.

The Manchester Corporation (General Powers) Bill includes certain provisions relating to the Eastern By-pass Road.

Darlington Corporation desires to make provisions as to fees in respect of property lost in transport vehicles.

Sheffield Corporation asks for power to provide a motor omnibus station for the use of the Corporation and other omnibus proprietors, and to make charges therefor. Coventry Corporation seeks somewhat similar powers.

The Cardiff Corporation Bill includes a provision for payment of compensation for damage to public lamps, etc. Bootle Corporation seeks further powers for the prevention, removal or mitigation of unreasonable or unnecessary noise.

The Southern Railway asks that station premises of the Company shall be deemed to be a street or place for certain purposes of the London Hackney Carriage Act, 1831.

The G.W.R. and certain London Underground Railways seek to apply Section 35 of the London Hackney Carriage Act, 1831, to station premises.

The Essex and Kent County Councils jointly seek power to construct and maintain a tunnel under the Thames, with approaches, from Purfleet to Dartford, and to charge tolls on traffic through or over the same.

Liverpool Corporation wants to construct new tunnels for road and tramway communication between certain points.

Proposals for new bridges (some with opening spans), are put forward by the Middlesbrough Corporation and Durham County Council (jointly), Stockport Corporation and other bodies.

There is also a scheme for extending the existing quay embankments, with a bascule bridge, in Weymouth and Melcombe Regis Harbour.

The Southern Railway asks for confirmation of an agreement with the Kent County Council relating to opening a bridge over the River Swale and freeing such bridge from payment of tolls.

The construction of a new quay on the River Ouse at Kings Lynn, and the levying of tolls and charges in connection therewith, are contemplated by the King's Lynn Docks and Railway Co.

The Middlesex County Council asks (*inter alia*) for authority to make and carry into effect an agreement with the Grand Union Canal Co. with reference to the completion of the North Circular Road across the company's canal at Stonebridge Park, Ealing.

Southampton County Council seeks power to acquire the Burlesdon Bridge and Roads, and to take or discontinue tolls and charges in respect thereof.

The Bournemouth-Swanage Motor Road and Ferry Co., asks to be empowered to construct a bridge, with approaches, from Studland to Parkstone, to control the user of the bridge and the traffic thereon, to levy tolls and charges, to discontinue the ferry service, etc.

Rotherham Corporation proposes to make further provisions with reference to public weighing machines, with penalties against persons committing, assisting in or conniving at fraud.

Many public authorities and other bodies seek powers which, on account of the exigencies of space, cannot be set forth in detail here, but the general nature of all or some of the powers desired is indicated in the following table:—

Powers sought (either new or in addition to or in extension of existing powers).	Name of Authority or body.
To run motor or other omnibuses in and/or beyond their respective areas.	Birkenhead; Bournemouth; Brighton; Burnley; Bury; Chester; Dearne District; Hull; Lancaster; Leeds; Leicester; Llanelly, etc., Elec. Supply; Manchester; Newport (Mon.); Prestwich; Rochdale; Rotherham; Salford; Southend; Stockton-on-Tees; Stoke-on-Trent; Walsall; W. Bromwich; Yorkshire Traction Co.
To run trolley vehicles in and/or beyond their respective areas.	Birkenhead; Bournemouth; Brighton; Dearne District; Derby; Hastings Trmwys; Hull; Leicester; Liverpool; Llanelly, etc., Elec. Supply; London United Trmwys; Maidstone; Newport (Mon.); Nottingham; Portsmouth; Rotherham; St. Helens; Southend.
To construct or work tramways, new or acquired.	Leeds; Walsall; Wednesbury; West Bromwich.
To abandon all or part of their existing tramways or light railways, with or without substitution of motor omnibus or trolley vehicle services.	Bournemouth; Brighton; Derby; Leicester; Liverpool; Llanelly, etc., Elec. Supply; London United Trmwys; Manchester; Newport (Mon.); Nottingham; Portsmouth; Prestwich; Rochdale; Stockton-on-Tees; Walsall; Wednesbury; W. Bromwich; Yorkshire Traction Co.
To restrict or prohibit competitive running of omnibuses or other services.	Birkenhead; Cardiff; Dearne District; Derby; Hasting Trmwys; Hull; Leicester; Llanelly, etc., Elec. Supply; Nottingham; Prestwich; Rochdale; Rotherham; Southend; Stockton-on-Tees; Stoke-on-Trent; Walsall; Yorkshire Traction Co.
To increase temporarily or to continue temporary increases in the statutory maximum charges, or otherwise to increase or alter charges affecting the transport of goods.	Gloucester Harbour; L. & N.E. Rlwy. (docks, etc.); L. M. & S. Rlwy. (docks, etc.); Maryport Harbour; Milford Docks; Shoreham Harbour; Southern Rlwy. (docks, etc.); Southwold Harbour; Warkworth Harbour.
To make or vary regulations for the control of traffic and/or for the regulation of Hackney carriages and other vehicles.	Birkenhead; Bournemouth; Herne Bay; Liverpool; Metropolitan Rlwy; Rotherham; Southport; Walsall; Wednesbury.

New Association.—An Association known as the Dearne Valley Motor Users' Association has been formed, with the object of organising the owners of local passenger transport undertakings. Mr. Hubert Burrows, of Wombwell, has been appointed the first president.

Street Accidents Conference.—Mr. Herbert Morrison, the Minister of Transport, is calling a conference on the question of street accidents in London. The conference, which will be public, will meet on January 14th, and will probably last two days. Mr. Morrison will preside.

Control of Traffic on Roads.

C.M.U.A. discuss the First Report of the Royal Commission on Transport.

The Commercial Motor Users' Association held a Conference at Olympia, London, on November 13th last, when the First Report of the Royal Commission on Transport, dealing with the control of Traffic on Roads, was under discussion.

Mr. Geo. Monro, C.B.E., M.Inst.T., the President of the Association, presided, and said that the Report had been before the Council of the C.M.U.A. and the majority of the proposed regulations did not seem contrary to the policy of the Association. There were certain proposals, however, to which they could not agree.

Mr. E. S. Shrapnell-Smith, C.B.E., who opened the discussion, said that despite the admitted seriousness of highway accidents, he contended that, even more than the horse ever was, the motor vehicle was man's best friend. Accident ratios would decrease, as they had done in America, and motor developments generally would increase. It was most of all due to the extended use of commercial motors both for goods and passengers that our country and Empire were being opened up to the people as a whole.

The National Council had considered the thirty recommendations contained in the first report and had accepted twenty, and of the remaining ten they could agree to five subject to slight amendment.

With regard to some of the agreed recommendations he would like to say something. Recommendation number IX dealt with the question of being drunk whilst in charge of a car, and when he gave evidence for the C.M.U.A. before the Royal Commission he was requested to bring to the notice of the Commissioners that the C.M.U.A. suggested that this should be allowed to read "drunk while driving or attempting to drive." He was sorry the Commissioners had not embodied this in their recommendations, and he hoped that when the necessary Bill was being drafted an endeavour would be made to use the wording he suggested.

The Association agreed with recommendation XXIX that road authorities should provide footpaths, and he was sure that the C.M.U.A. would be prepared to support an extension of charges upon the Road Fund for their provision. No universal rule could be applied in regard to footpaths, but where possible on narrow roads they should be put at the top of the bank behind the hedgerow.

The five recommendations which were agreed to subject to slight amendment were Nos. VI, VIII, X, XII, and XXIII.

Recommendation No. VI was the dangerous driving clause. The penalties for dangerous driving showed a considerable increase, and it was proposed that in the case of a second or subsequent conviction the licence should be automatically suspended for a period of not less than six months. He thought they should ask that the question of the automatic suspension of a licence should be left to the discretion of the magistrates, and he would like to see the period of suspension reduced from six months to three.

Recommendation No. VIII said that any person organising or taking part in or conniving at motor racing or speed trials on a public road should be guilty of an offence. The Association thought that where racing or speed trials were allowed with official sanction, members of the Association who participated in them to the extent of taking char-a-banc parties to watch the races should be exempt from any question of being penalised for connivance.

Recommendation No. X was to the effect that prosecutions for dangerous driving and other offences should be invalid unless notices of prosecution had been given to the offender within a reasonable period after the commission of the alleged offence. The Association thought that notice should be given within fourteen days. The police, he knew, had special arguments to show that in some cases it was impossible for them to trace a man within fourteen days. In the case of a fatality a longer period might be allowed, but to have the risk of a prosecution being launched, say, five weeks after an alleged offence, except in very serious cases, was a question that should be taken further.

Part of Recommendation No. XII was to the effect that in the case of a goods vehicle which exceeded 2½ tons unladen weight or of a public service vehicle, a licence to drive should not be effective unless the holder of such licence was 21 years of age or over. Many drivers of eighteen knew enough and were old enough, but on the other hand they must consider the question dispassionately.

Recommendation No. XXIII dealt with the provision of car parks by local authorities, and the National Council agreed with the desirability of further car parks being provided, but they asked that the charges should be reasonable.

The five recommendations reserved for further consideration were Nos. V, XXII, XXIV, XXV, and XXVII.

No. V dealt with speed limits. He thought it was a matter of wide public interest to examine from every point of view the policy of allowing private cars and sometimes very heavy cars, not too well maintained, to have no speed limit and at the same time to impose upon the owners of motor omnibuses and coaches a maximum speed limit of 35 m.p.h., and even the lightest goods vehicles, i.e., not exceeding 2½ tons unladen weight and all wheels fitted with pneumatic tyres, were limited to 30 miles per hour. Those who travelled on the roads knew that the light and medium weight motor bus and motor coach kept ahead of one going from 35 to 40 m.p.h. and did less harm than if they were restricted to a speed which would necessitate an increase of cutting-in. The question of speed limits would be fought out in the interest of the public.

Recommendation No. XXII said that the Minister of Transport should have power to make regulations relating to the construction of vehicles, but questions relating to speed limits, maximum unladen weights and axle weights should be decided by Act of Parliament. The history of the development of commercial road transport, with which he had been identified for thirty-three years, undoubtedly proved that the industry had benefited by Parliament leaving to the discretion of the Minister anything in the nature of regulations as to axle weights and other technical matters, rather than to attempt to deal with them in the House of Commons.

Recommendation No. XXIV sought to make it an offence to leave a vehicle standing between the kerb and a white line, but what was to be done in the case of a tradesman whose shop happened to be on a white line corner? This matter would need further consideration.

Recommendation No. XXV dealt with the question of compulsory third party risk insurance, and the Association had reported that in principle they were in favour of it but it was realised how difficult the question was. For instance, the man in the street would think that with compulsory third party insurance, if there was an accident he would be paid in any event. It was not proposed, however, to alter the law concerning contributory negligence, and if a man was found guilty of contributory negligence he would not benefit.

Recommendation No. XXVII was to the effect that the Ministry of Transport should be enabled to make grants to highway authorities towards the cost of the erection of weighbridges, but the flaw here was that a driver of a vehicle over weight would go the other way. He remembered that some years ago a county council laid down a weighbridge and pulled it up again because drivers turned into side roads to avoid it.

When one looked at the terms of reference of the Royal Commission one read that the Commissioners were appointed to take into consideration the problems arising out of the growth of road traffic and with a view to securing the employment of the available means of transport to the greatest public advantage, and he felt that the Commission had kept their terms of reference well in view, and had endeavoured to frame recommendations which would permit those interested in road transport to develop and go ahead, and it remained for the Association, with their allied bodies, to see that when the time came for a Bill to be presented to Parliament the point was not missed that the object of the Royal Commission was not to diminish or hamper road transport but to develop it so that it could grow in the public interest and in the interest of the industry and agriculture of our country.

Major E. G. E. Beaumont, O.B.E., said that they wanted transport to develop unharassed by unnecessary regulations. At the same time users had to consider their responsibility in ensuring safe and efficient development. The figures given in the report regarding street accidents were rather a shock to him. They wanted to see the average speed of traffic increase, and it could

Digitized by Google

increase safely as long as road customs generally were improved to suit new developments. He believed that much in the Report would help to effect improvements. Regarding the ascertainment of axle weights, it seemed that the authorities should overhaul their machinery as it ought not to be necessary for a vehicle to have to travel a considerable distance to enable the authorities to weigh it. A weighbridge was not the only way of ascertaining axle weights, and he suggested that it was quite possible for the Authorities to use some portable apparatus. In paragraph 66 the Commissioners stated that they approved of clause 13 in the Draft Road Traffic Bill which dealt with the method of calculating the weight of vehicles, but as the definition was drawn it still left open to dispute the question what was or was not a permanent part of a vehicle.

Mr. S. McAdam (Cadbury Bros., Ltd., Birmingham) said that the recommendation regarding compulsory insurance for third party risks was applicable to motor vehicles. He would like to see the word "motor" deleted and the provisions apply to all vehicles, including goods-carrying vehicles whether horse drawn or motor driven. He thought that the age at which a driver of a goods vehicle exceeding 2½ tons unladen weight would be allowed to drive should remain as now and not be raised to twenty-one years of age. With regard to automatic signal lights, there were only three colours in use at present and he thought that a fourth might be necessary for the guidance of vehicles wishing to move off to the right, i.e., cutting across the flow of traffic.

Mr. E. Graham Guest (McVitie, Guest & Co., Ltd., Edinburgh) said that with regard to the proposal that a compulsory inquiry should be held by the Minister of Transport in the case of accidents to public service vehicles involving death, already there was an inquiry in Scotland into such cases and in England they had a coroner's inquest. He thought there should not be a second inquiry. The Minister could be represented at a fatal accident inquiry in Scotland or at a coroner's inquest in England and that should be sufficient. As to speed limits for goods vehicles, was it possible for a driver to differentiate between 20, 16 and 12 miles per hour, and to pull a driver up for doing 20 miles instead of sixteen seemed to be ridiculous. Automatic light signals should not be put at the top of a hill as it was difficult for a horse or even a heavy lorry to get away when the all-clear was given.

Mr. G. Artlee (Samuel Allsop & Sons, Ltd.) said it was difficult for a road operator to keep his men in line with very stringent regulations, because when a man was out with a vehicle he alone was responsible for his own conduct, and if the regulations were so tight and there was a differentiation between speeds of 20, 16 or 12 miles an hour, the commercial vehicle driver would tend to slow down to avoid prosecution, and that would mean that commerce from a transport point of view would slow down and become uneconomic. He did not think that eighteen years of age was too young for driving heavy vehicles. The driver of eighteen had plenty of road sense and often had more safety and caution about him than many older men.

Mr. R. W. Royle (Co-operative Wholesale Society, Ltd., Manchester) expressed the opinion that it would be dangerous to have varying speed limits for different classes of vehicles. Regarding the excessive noise regulations, commercial motor users were being pestered as to alleged offences. They could not possibly keep milk cans from rattling, especially if they were empty. They had understood that milk cans would be exempt as they contained a commodity used in the ordinary way, but the police were prosecuting, and the difficulty was that the alleged offence might have been committed four or five weeks ago, and the man concerned might have left a firm's employ before the Court proceedings. The period within which a complaint could be made should be limited to seven days. As to car parks, many local authorities were placing them a long distance from the centre of business and drivers had to leave their goods in the park with perhaps nobody in attendance and go back into the town to make necessary arrangements and then go back and bring the vehicle into the town. Car parks should be in close proximity to the centre of the town Acetylene head lights had been found convenient and useful and better in fog than an electric light. The provision of weighbridges should not be a charge upon the Road Fund. If local authorities had to pay a certain proportion of the cost of building a weighbridge they would hesitate before putting so many restrictions upon the road user.

Mr. A. C. Norman (Southern Transport Co., Ltd., Brighton) said that undue restriction on the speed of goods carrying vehicles would have an adverse effect upon our export trade. Our vehicle manufacturers were about to make a big bid for the overseas market, and if heavy goods vehicles were restricted to 20 m.p.h. our manufacturers would be forced to build two types, one for use at home and another for service overseas, and they would see the same unhappy results now seen in regard to the private car market. It appeared necessary to press for higher speeds. It was suggested that questions such as speed limits should not be left to the discretion of the Minister of Transport but should be laid down by Act of Parliament. That was all right in theory, but if twenty miles an hour for heavy goods vehicles was embodied in an Act of Parliament they would be saddled with that speed for years. He hoped the Association would press for commercial vehicles fitted with pneumatic tyres to come under the 35 miles an hour category. As to leaving a vehicle standing between the kerb and the white line, in a number of the older towns there were business premises without a back or side entrance, and if it was an offence to leave a vehicle standing between the kerb and the white line in such circumstances, it would be a serious position for commercial operators.

Major-General S. S. Long, C.B. (Director, Lever Brothers, Ltd.) expressed the opinion that the differentiation between the speed of commercial and other vehicles should be removed. Notice of a prosecution for dangerous driving should be given within a reasonable period, but in cases in which someone had been injured it might not be easy to trace quickly the parties concerned. He might be driving along quietly and another driver might come along at an excessive speed round a dangerous corner and cause him damage, and it would be unfair if, because he could not discover the identity of the offender for a week or ten days, he should be prevented from taking action against him. Regarding the age of drivers, he thought that if they allowed a lad of eighteen to drive a heavy motor vehicle they were rather asking for trouble. Many young men of eighteen had a lot of road sense but there was a bit of the daredevil about others. He did not think that twenty-one years of age for a driver of a goods vehicle exceeding 2½ tons was on the wrong side.

Mr. Norman E. Box (Manchester) thought they had all rather missed the point, viz.: the trouble operators had to comply with the law. When a man made a road why could he not be compelled to make it fit to carry their vehicles? Half the accidents were caused through the dangerous state of the road. It should be an infringement of the law for authorities to make roads which did not meet requirements and were slippery.

Mr. J. R. Etheridge did not think that a man should hold a licence for driving a heavy vehicle unless he was twenty-one years old. A man under that age should be allowed to drive a vehicle up to 2½ tons only. He was in favour of third-party insurance, and also thought that one inquiry in a case of accidental death should be sufficient.

Colonel R. E. Crompton C.B., said that transport conditions varied from year to year and regulations made to-day might be out of date in a year or two. Instead of an Act of Parliament there ought to be established a permanent Board, something like the Central Electricity Board, to deal with transport questions.

Mr. J. H. Wort (Wort and Way, Limited, Salisbury) was of opinion that the police had ample powers, if they used them, to control traffic, and there was no need whatever for any speed limits. It seemed impossible to arrive at any definite conclusion as to when a man was drunk whilst in charge of a car. A man might very well be drunk without being incapable. With regard to the age for heavy goods vehicle drivers; during the war many drivers were sent overseas at the age of eighteen, and he could not see how the army was to carry on if men, enlisted at eighteen years of age, were not allowed to drive a three-ton lorry until they reached the age of twenty-one. With our short service system they would almost be out of the army before allowed to drive (laughter). With regard to car parks, if local authorities made a charge for the use of a park they should be responsible for the vehicles, and if anything was taken from a vehicle whilst in the park they should also be responsible. With regard to compulsory third-party insurance, he welcomed the proposal. With regard to Mr. Box's criticism of the roads, he thought the greatest difficulty was, not mistakes made by those local authorities who tried to give them good roads, but the backward authorities who did not take advantage of the good things offered them by the Ministry of Transport.

Mr. P. R. Turner (Thos. Allen & Son, Ltd., London) supported the criticisms made of the recommendations of the Royal Commission so far as the speeds of goods carrying vehicles were concerned. He thought it would

Digitized by Google

be agreed that the law was brought into disrepute because it was generally disregarded and it seemed to him that the recommendations were, in many respects, so far behind the practice of the times as to be out-of-date before they were put into force. He earnestly requested the Association to press for the whole of the recommendations regarding speed limits for goods vehicles to be reconsidered in the light of modern practice.

Mr. C. le M. Gosselin (Managing Director, H. Viney & Co., Ltd., Preston) said the Royal Commission seemed to have taken a growing child and were endeavouring to fit it into a suit of clothes a size too small. That was not healthy, and he could not conceive any better way of damaging the progress of road transport than by following the recommendations, especially with regard to speed. He realised that the Royal Commission had a big task, but somehow he did not think they had hit the nail on the head exactly. A 30 cwt. lorry, fitted with solid tyres, could only go at 20 miles an hour, and yet a heavy goods vehicle, fitted with solid tyres and with 12 or 16 wheels and perhaps carrying 100 tons, appeared to be able to go at 16 miles an hour. Clearly it was not in the minds of the Commission to so burden the industry, and it was obvious that the recommendations required to be gone into very carefully.

Mr. R. E. Morley (Traffic Manager, Bryant & May, Ltd.) said it seemed to him to be important that such questions as speed limits, maximum unladen weights and axle weights should be left to the discretion of the Minister, and not fixed by Act of Parliament.

Mr. J. H. Stirk (Traffic Manager, Birmingham Co-operative Society, Ltd., Birmingham) said that in Birmingham if a motorist was stopped for some alleged offence he was always told by the constable that he would be reported for a summons, and whether a summons was eventually issued or not was a question for the superintendent of police. He (Mr. Stirk) was one of those fortunate or unfortunate individuals who had to sit in judgment upon his fellows, and he noticed that the Royal Commission approved of the proposal in the draft Road Traffic Bill to considerably increase the penalties for dangerous driving. He did not know whether the evidence of one policeman would be sufficient to prove that a man was driving dangerously, whilst that of two policemen would be required to prove that one was exceeding the speed limit. To be in the hands of one policeman to the extent of a fine of £50 or £100 was giving that policeman tremendous power. He suggested there should be corroborative evidence.

Sir William E. Lobjoit (a member of the Royal Commission on Transport) said that the chief business of the Commission was to consider what was to the public advantage, and not to consider what would be to the advantage of any particular industry, and it was public opinion, as expressed by votes, that would govern the matter. Though he was willing to say a few words by way of explanation or illustration, he was not there in any sense to defend the Royal Commission, whose report must stand for what it was, or what it was not. The report of the Royal Commission was not concerned with the drafting of clauses for a Bill. With regard to dangerous driving, no doubt the Bill, when presented, would contain some definition of dangerous driving, and as to corroborative evidence, the Bench of which he was a humble member was quite free to disbelieve a policeman or a force of policemen if they liked, and a case would depend upon the judicial capacity of the bench and their ability to decide upon the evidence before them.

Someone had charged the Commission with being inconsistent in regard to speeds when they differentiated between a vehicle carrying passengers and the same vehicle classed for carrying goods, but he would point out that before a vehicle could be licenced to carry passengers it must be constructed in a manner approved by the Ministry and must be subject to annual examination. This was not the case with goods vehicles, and it was possible for a goods vehicle to be on the road not so well prepared as was compulsory in the case of a passenger vehicle. As to leaving certain matters to the discretion of the Minister and making other regulations statutory, the idea in the minds of some of the Commissioners was that it would be better for the industry if certain matters were definitely defined by Statute so that manufacturers should know there was no fear of some sudden alteration which would cause designs to become out of date. It had been suggested that third-party insurance should apply to all vehicles, but he would like to know how it was to be done in the case of the farmer who did not need to licence some of his vehicles. Motor vehicles had to be licensed, and the report contained the proposal that any person applying for a licence for a vehicle should produce a receipt from an authorised insurance company showing that he was insured against third-party risks involving death or bodily injury. How they were to get people to be insured who did not require to be licensed he did not know. With regard to the proposal that there should be a compulsory inquiry by the Minister of Transport in the case of all accidents to public service vehicles involving death, he would point out that a coroner's inquiry was only concerned with the cause of death, and he thought that the inquiry as envisaged in the report would enable inquiries to be made as to the cause of an accident and that was outside the province of the coroner's inquiry. An inquiry such as suggested in the Report might be of great benefit to all users of the road, as well as to the designers and builders of vehicles. With regard to white lines, it was suggested that it should be regarded as an offence to leave vehicles standing between the kerb and a white line, qualified by the proposal that regulations should not come into effect until the location of white lines had been reconsidered by local authorities in conjunction with the Ministry, and only those authorised by the Minister were left.

The meeting terminated with a vote of thanks to the Chairman for presiding.

Road Fund Report.

THE Report on the Administration of the Road Fund for the 12 months ending 31st March, 1929, is now on sale. Copies (price 1/-) may be purchased directly from H.M. Stationery Office or through any bookseller.

The total receipts of the Road Fund from all sources, amounted to £21,298,300, as compared with £20,348,503 in the previous year.

The approximate number of vehicles for which licences were granted during 1928 was 2,036,000, and the approximate number of driving licences 2,527,000. The corresponding figures for the previous year were 1,898,500 and 2,349,900. It is estimated that the figures for 1928 represent one motor vehicle for every 22 persons in Great Britain, and one driving licence for every 18 persons.

The Report shows that the total length of the public highways in Great Britain is 179,095 miles. In 1918, the total length was approximately 177,000 miles, so that during the ten years since the war, over 2,000 miles of roads have been added to the nation's system of public highways. In addition to this increase in total length, many of the old highways have been extensively widened during the same period in order to give better accommodation to the ever-growing volume of traffic they are called upon to carry.

The present total length represents an average of a little over two miles of highway to each square mile of territory, and (on the basis of the estimated population in 1928) about 250 persons per mile of highway.

Bridge-works (including schemes for new bridges, as well as schemes for the widening, reconstruction and strengthening of existing bridges) approved during the year for grants from the Road Fund, numbered 408. Several bridges of the first importance were completed during the year, including two links in the Great North Road to Scotland—the Newcastle-Gateshead Bridge, and the Royal Tweed Bridge at Berwick. The former has the largest span of any arch in this country. The latter supersedes for through traffic the old narrow seventeenth century Berwick Bridge over the River Tweed.

The experimental work being carried out by the Ministry, in conjunction with the National Physical Laboratory, is dealt with in some detail. The object of the present experiments is to determine: (1) the effect of varying certain factors in the design and construction of concrete roads; (2) the conditions which give rise to the skidding of vehicles; and (3) the impact of vehicles on highways. Experimental sections of road have been constructed on the East Ham and Barking by-pass and the Barnet by-pass. A special experimental road is being constructed as a by-pass to the Colnbrook by-pass road, in the neighbourhood of which an experimental station is being erected.

Other subjects dealt with include the administrative action taken by the Minister under various Acts of Parliament, the construction of the Glasgow-Inverness Road, the Glasgow-Edinburgh Road and the Liverpool-East Lancashire Road, and the reconstruction of the Perth-Inverness Road, the results of the investigations into the causes of various road accidents carried out by officials of the Ministry, and the estimated revenue accruing to the Road Fund in the year 1929-30, together with a statement of the purposes for which it is proposed to make grants during that year.

Institute of Transport.

Annual Dinner of the Manchester and Liverpool Section.

SIR JOSIAH STAMP, G.B.E., President of the London, Midland and Scottish Railway, made a striking speech on the necessity and objectives of co-ordination between road and rail transport at the annual dinner of the Manchester, Liverpool and District Section of the Institute of Transport, held at the Midland Adelphi Hotel, Liverpool, on November 29th.

Mr. C. le M. Gosselin (H. Viney and Co., Ltd.), presided over a company which included representatives of some of the principal goods haulage and passenger transport concerns in the South West Lancashire area, and also representatives of the railway companies.

Mr. W. Edwards proposed "The City and Corporation of Liverpool." He declared that the city was what the citizens made it. He believed they felt that the city was not what it ought to be and that frame of mind was undoubtedly helpful to those who had to administer their affairs. What responsibilities they had as citizens were also imposed on traders, who realised that the prosperity of the port depended upon the way its resources were employed. The new Mersey tunnel really developed through the enterprise of the Liverpool Corporation and the traders. The former set up the Co-ordination Committee and brought into line the different interests on both sides of the River Mersey. The port authority had always been most sympathetic to the traders interests.

The Lord Mayor of Liverpool (Mr. Lawrence D. Holt, J.P.), said that members of the Institute were, for the most part, engaged in domestic transport, whilst he, in his personal capacity as a shipowner, was somewhat deeply concerned with foreign transport, but as Lord Mayor of Liverpool, he was equally concerned with both. One and all depended for their well-being and their prosperity upon their expertness in transport.

"We are by essence a community of carriers. Thank God indeed, we have something to carry, and it is our job, above all other jobs to see that that carrying is well done."

Transport men were giving an invaluable service in helping to pursue the pure truth in these matters and to keep it free from external political matters and establish and consolidate the technique of their service. Those services were co-related to the responsibility of efficient and rational administration in the interests of the community at large. What impressed him more than anything else was the vital necessity of the co-relation of all transport interests. Let them have competition, by all means, a competition perfectly fearless and prepared to put whatever was out of date on the scrap heap, whoever's lot it was to go on the scrap heap, but not competition deliberately designed to destroy rivals. His view was that competition should go to the full lengths, but at the same time preserve perpetually the spirit of co-relation in matters of common interest. If they did not put common interests before sectional interests, the great days of this country were numbered.

The Vice-Chancellor of the Liverpool University (Dr. H. J. W. Hetherington, who submitted "The Institute of Transport," after alluding to the aims and objects of the Institute, said that the interests and welfare of the city and of the community in general, depended first, last, and all the time, on transport, which was a fundamental and primary necessity of civilisation. It was the medium for the exchange of commodities equally with the exchange of ideas, and was, therefore, the most universal of all occupations. Every form of industrial occupation was, in some respect, a function of transport.

Sir Josiah Stamp, G.B.E., responded. The Institute, he said, struck many outsiders as a very curious body that comprised people who did not hesitate to cut each other's throats in public, yet came together as a united body with one subject, one object, and one everything else, on such occasions as that. They were seeking to get a new equilibrium, an equilibrium that was economically valid in a field of progress where it seemed as if equilibrium was not possible, because of the risks of saying how long any particular state of affairs would remain before being superseded. Capital was much more precious to-day than it used to be, and it, therefore, behoved them to be most careful in its use. If the Institute of Transport could help towards the wise co-ordination of expenditure on capital outlays, it would deserve well of the community. There had been a lot of movement in the transport world, but not all bustle was progress towards the ideal of service at the least cost to the community. The uppermost problem of the moment was the co-ordination of road and rail transport. A little over a year ago, the railways were given powers to run road vehicles, and that time had been occupied by very strenuous work and a great deal of negotiation on the question of financial arrangements. It was open to them, of course, to spend large sums of money and to embark upon extensive road services, but that would have meant shouldering very great risks and adding to the further congestion of the roads. Conditions might have been quite different had road powers been granted to the railway companies eight or nine years ago. Much time had been spent in exploring various ways in which the interests of the different sections of the community could be reconciled. The time had been well spent because the arrangements were now practically complete for the co-operation between the leading firms on the roads and the railways. These would be carried out in detail by local officials in the various districts that knew the local conditions, and were able to get the best out of both systems. Consideration would be given to each local problem by men on the spot who, he believed, would be able to produce results that would be beneficial all round. The system would be responsive to all needs. Experiments would have to be made to ascertain what facilities were required not only to meet the public need, but to create it. So far as the railways were concerned, one often wished things were not as they were. The railways were tied down by physical conditions and heavy capital expenditure. It was not easy, for instance, to move a main line three quarters of a mile so as to link up a village, yet with the changes that were pending, it was possible that places now served by railway, would be less served by them in the future. That would give scope for road transport and leave the main lines a little clearer for fast traffic. There should be created an ideal of public service towards which all their aims and objects should be directed. Every action they took should bring them a step nearer that goal. It was not so much that they should run fast, as that they should travel in the right direction. Sir Josiah Stamp went on to speak of the contribution of the Institute of Transport in the solution of scientific problems of the day. He averred that there was a difficulty in getting young men of outlook and experience to tell the story of their own particular field. They were afraid of the criticism of superior officers who sometimes in big organisations had to draw the line of demarcation between matters of comment and matters of discipline. It was the rule of his company that contributions by officers should be seen by superiors, but no young man would get into hot water for simply using his brains. It might be necessary to cut something out of a paper, or perhaps suppress it entirely, yet it was recognised that the man was a tryer, and he would not suffer in consequence. In a final word, Sir Josiah Stamp said the Government's development schemes might provide some branches of transport with the means to serve the public without the tremendous financial risks which otherwise might be present, but no amount of benefit resulting from the immediate spending of money was any good, unless, in the long run, the scheme was self-supporting. Money must be spent wisely with the object of economic productivity.

Alderman James Sexton, C.B.E., M.P., J.P., proposed the toast, "Trade and Commerce."

Lieut.-Col. Albert Buckley, D.S.O., J.P., urged that what commerce needed to-day more than anything else on the part of the House of Commons, was first of all a sympathetic understanding of the difficulties that it had to contend with, and secondly, a sound financial policy encouraging stability in all conditions affecting trade.

Mr. R. C. Reynolds, O.B.E., in proposing "The Chairman," said that Mr. Gosselin was one of the oldest road transport contractors in Lancashire. That, in itself, was not necessarily a great virtue, but Mr. Gosselin conducted one of the most successful businesses in which he had demonstrated what road transport was capable of. He knew of no one more deserving of respect than their Chairman.

Mr. C. le M. Gosselin, who was cordially applauded when he rose to respond, thanked his colleagues of the District Committee for their loyal and unstinted co-operation, particularly Mr. David Halliwell, to whom he owed a great debt of gratitude.

Furniture Warehousemen and Removers' Association.

Bi-Annual Meeting.

THE Bi-Annual Meeting of the Furniture Warehousemen and Removers' Association was held at the Imperial Hotel, Birmingham, on November 14th and 15th last. There was an excellent attendance.

Members and friends were the guests of the Midland Centre, and a hearty welcome was extended to all by the Chairman of the Centre, **Mr. F. W. H. Winwood** (Frederick Winwood, Ltd.), Worcester.

Mr. A. E. Millard (Robson & Sons, Ltd.), Newcastle-on-Tyne, the President of the Association, presided at the General Meeting, and after some formal business had been transacted an Extraordinary General Meeting was held to consider a resolution proposing a new scheme for constituting and electing the Executive Committee.

Mr. A. E. Knill (Pickfords, Ltd.), London, explained the scheme under which, he said, it was hoped to make the election of the Executive Committee more democratic. He reminded the members that the scheme originally proposed had proved unworkable and a Special Committee, set up to re-consider the matter, had drawn up special resolutions, copies of which had been circulated to all members. Under the new scheme there would be approximately the same number of gentlemen on the Executive Committee, as heretofore, drawn from the various centres and areas. those centres where the membership exceeded thirty being entitled to a second seat on the Executive, and so on for each additional thirty members or part of thirty. The Committee would be entitled to classify local centres into areas and those areas would be entitled to appoint members of the Committee on such basis as to numbers from each area as the Committee might from time to time consider equitable, having regard to the membership of the local centres comprised in such areas. In addition the resolutions provided that the President, Vice-Presidents, Past Presidents, Treasurer and Chairman of Sub-Committees and the President of the British Association of International Furniture Removers should be members of the Committee. In order to put the scheme into operation it was necessary that all members of the Committee, except *ex-officio* members, should retire at the close of the Annual General Meeting in 1930, but they would be eligible for re-election.

MR. A. E. MILLARD
(ROBSON & SONS, LTD),
PRESIDENT.

After Mr. Knill had dealt in detail with the proposed new scheme he moved the adoption of the special resolutions. The proposition was seconded, and, after discussion, in the course of which the members of the Committee responsible for drawing up the scheme were complimented upon their efforts, the special resolutions were passed unanimously after slight amendments had been made to (i) and (v) sub paragraph (b) of paragraph 2 of the special resolutions as circulated.

Mr. A. G. Coombe (The Pantechnicon), London, addressed the members on the question of adopting a registered design for the Association. He said that the Association had not a badge or symbol to indicate to the public who they were, what they were and what they were prepared to do. Many of the greatest achievements in history had been accomplished under some badge or symbol. All regiments had their Colours and every college and school had its badge and prized it.

He knew there were some objections to an Association badge and without expressing any personal opinion on the matter he introduced the subject and asked the members to consider it, as he felt that unless such a scheme, if adopted, was taken up whole-heartedly it would be of little use. A badge was something tangible and something that could be withdrawn if a member did not come up to the standard expected by the Association. By adopting a badge it seemed to him that members would have to agree to maintain a certain standard.

After discussion it was decided that a definite scheme should be brought forward at the next annual general meeting.

Mr. F. C. Skinner (Arding & Hobbs, Ltd.), London, submitted a statistical return covering six months working of a specific branch of the activities of the Association which are watched over by a Committee of which he is the Chairman. He referred also to a booklet issued by the Association's Costing Committee. Hearty thanks were tendered to the Committees concerned for their efforts.

PROPOSED CERTIFICATE OF MEMBERSHIP.

Mr. Geo. Moores (G. Moores & Sons, Ltd.), Manchester, in a paper entitled "Certificate of Membership," said that in considering the question of whether the Association should issue a certificate of membership to members, they might profitably spend a few minutes examining the Warehousing and Removing Industry and look into it from the point of view as to whether it was a desirable business to attach one's self to; and if so, whether there was any usefulness, honour, dignity, pride or profit in holding a certificate of membership in it.

Might not the Warehousing and Removing industry be defined as a body of business men specialising in the removing of household goods from one place of residence to another, and also, if need be, holding those goods in safety until such times as delivery of them was called for? Did they as frequently as they ought consider all that was implied in that trust which the public placed in them? Take an ordinary everyday household removal. It contained the usual furniture and effects, and amongst them were not only ordinary household goods, but very likely some household gods as well. Such articles were every day entrusted to their care with implicit faith that they would be cared for and accounted for, and delivered as safely as the owners themselves would do it. Did not all that imply the greatest confidence in the members of their industry, and did it not imply that they were a recognised trustworthy body of men, a specialised body of men; a class apart from and above the nondescript who might own a horse and lorry or even a motor wagon to carry out any odd job that might come his way. Did anyone present know of a single instance where a member of their Association had not been faithful to his trust? Such a breach of trust, should it ever occur would, no doubt, be visited upon the member by instant dismissal from the Association.

Their business demanded not only honesty and integrity, but specialised knowledge of furniture; how best to dismantle and re-erect it, and how best to handle it generally so that it might be carried with ease and packed with safety and finally handed over in perfect condition. Figuratively speaking there were a hundred and one other qualifications which the successful remover and storer must have, such as a knowledge of horses and horse-drawn vehicles; a knowledge of power-driven road vehicles; he must be well versed in railway and steamship rates, have a working knowledge of Colonial and Foreign Tariffs and of Law as it related to acts of Trustees, Executors, rights of husband and wife in property, the hire system, Fire Insurance, the law of Contract and that of Common Carrier, and above all he must have a deep understanding of human nature. Was it not an industry in which they might take a legitimate pride and display, with honour, any parchment which indicated that they were certified members of such industry?

Digitized by Google

It did not require a great effort of imagination to foresee the time, and he believed a time in the not very distant future, when they would be asked by the discerning public before they placed business with them "Are you a certified remover." Then would they have just pride in displaying their certificate. They must so act that when that time came the question should not merely be "Are you a certified remover," but, by further educating themselves in their work and the public in the services members rendered, they would induce the public to ask—fully recognising all that was implied in the greater question—"Are you a member of the Furniture Warehousemen and Removers' Association?"

He submitted that it was desirable in the interests of the Association and its members, that a Certificate of Membership be prepared and issued to all members, setting forth that the holder was a qualified remover and a certificated member of the Furniture Warehousemen and Removers' Association. It would then behove members and the Executive Committee as the responsible Board to see to it that membership was attractive and valuable alike to its members and the public.

An interesting discussion followed and it was agreed that the matter should be considered in conjunction with the proposal to adopt a new badge or symbol for the Association.

PROPOSAL TO CONFER DEGREES ON MEMBERS.

Mr. Victor Bishop (Bishop & Son's Depository, Ltd.), London, addressed the meeting and suggested that the Association should have the power to confer degrees upon members.

Did members fail to have a proper appreciation of their true worth? he asked. Anything tending to raise the Status of the trade and to give uplift would be to the good. Increase their pride in their calling and increase its dignity, they could call it a profession if they liked, it was no worse than some (laughter) and increased prestige would bring its own reward. Did they value their membership of the Association as an honour or were they more inclined to capitalise its privileges and the information they received as against the annual subscription? If the Association was in a position to confer some tangible reward upon those of its members who were qualified to receive it, that would go far towards raising the standard of their trade. Therefore, he submitted to the Executive the suggestion that they should confer degrees, such as Fellows, Associates and, perhaps, Licentiates. The qualification necessary for a degree should be service and knowledge. Present or past services rendered to the Association either in its Council or otherwise, and service for any length of time or in a marked degree to the trade and knowledge tested by examination would qualify for an honour.

MR. F. W. H. WINWOOD
(FREDERICK WINWOOD, LTD., WORCESTER).
CHAIRMAN, MIDLAND (BIRMINGHAM) CENTRE.

The knowledge required in their particular trade was of great variety and could hardly be greatly exceeded by any profession.

It must be apparent to all of them that one of the missions of the Association was to educate its members and their employees to understand and deal with the problems and difficulties of their trade, and they were doing that through the medium of the Estimators examination and perhaps the award of some degree to a successful candidate would attract more candidates. He thought the time was coming when the knowledge, theoretical and practical of their industry, tested by examination and by the issue of the certificate, would be a *sine qua non* for anyone seeking a responsible position in a good class firm.

There were members who for their splendid services to the Association were worthy of the conferment of a degree.

He proposed there should be three degrees (1) Fellowship—for those possessing the necessary qualifications and who had attained a certain age and had been in business as a proprietor or manager for a certain number of years; (2) Associate—for those who had passed the necessary examination, had attained a certain age and had been in business either as principal or manager for a certain number of years; (3) Licentiate—this might include some of the junior members of the industry who, perhaps, had passed a preliminary examination and had been engaged in the business but a few years; this degree might cover a period of studentship.

He had purposely omitted to state precisely the qualifications for a Fellowship as that would be for others to decide, but personally he would award a Fellowship to those gentlemen who had been pillars of strength to the trade in the past and had watched it grow into a highly developed organisation. He would award a Fellowship also to those who had given so much of their time, in some cases to the detriment of their health, to the Association and had served it as President, Vice-President and Chairman of Committee or in some other exceptional way.

Any difficulties there might be in regard to awarding degrees could easily be overcome.

In the course of the subsequent discussion the view was expressed that the suggestions made by Mr. Bishop should receive whole-hearted consideration.

Mr. G. H. Good (J. J. Allen, Ltd.), Bournemouth, reported on the result of the Estimators Examination held recently. It is interesting to note that Mr. Busbridge, a member of the staff of The Pantechnicon, London, and trained under Mr. A. G. Coombe, was a successful candidate.

A resolution was passed that the next Annual General Meeting of the Association should be held in London.

A hearty vote of thanks to the President for presiding brought the business meeting to a close.

The Banquet.

The Banquet which followed the Annual General Meeting was attended by many distinguished guests.

Mr. F. W. H. Winwood, the Chairman of the Midland (Birmingham) Centre presided and submitted the toast of "The King," which was received in the usual loyal manner.

Mr. Ernest Bevin, General Secretary of the Transport and General Workers' Union, proposing the toast of "The Furniture Warehousemen and Removers' Association," said that on looking through the objects of their Association he noticed that one of their main objects was to promote the consideration and discussion of all questions affecting their trade and to protect its interests, and he assumed that this was not confined only to the business side. It was gratifying that they had lived to recognise a broader concept of industry. Everywhere to-day industry was not spoken of in the sense that it was the prerogative and property of just one partner, and he thought it was now recognised that management and labour were the two factors that had got to get the job done, with the financial interests behind the scenes reaping the harvest of both their efforts. He saw no reason at all why management and labour should not combine to exploit capital instead of capital exploiting both of them. (Laughter.) Really that was what they ought to be doing. (Laughter.) The managerial brain and the operative brain had a good deal in common and if they were to set about organising industry with that new concept in view he believed they would get over a great many of their troubles.

It was gratifying to know that the Furniture Warehousemen and Removal Industry had a Joint Industrial Council and he noticed that they were very interested in educational work. He was connected with one important industry in this country where the Industrial Council had taken over the whole question of technical education in conjunction with the City of London Guilds, and instead of technical education being purely the employers part of the business it was now run by the Unions and employers together with the result that the number of students had gone up enormously and he thought that as a result they were training an entirely new standard of foremen and managers out of the ranks and removing what was one of the handicaps to the workpeople.

He noticed that they had an international side to their work. Wherever there were international connections he hoped they would be used for promoting international goodwill as well as business, as that would mean the establishment of friendships that would help to solve the great problems facing our statesmen at the present moment.

Digitized by Google

COMING LEGISLATION.

A great opportunity would present itself to their Association during the coming year. Legislation would be before Parliament affecting the members of the Furniture Removers' Association and their employees, and he hoped that Industrial Councils would sink any political concept they might have and face the coming transport legislation in the interests of the men, in the interests of the problems of the road embracing the safety of the public on the road and that they would help Parliament to pass the right kind of legislation for their industry and for the men who had to use the roads under all kinds of conditions.

THE BLIGHT OF UNEMPLOYMENT.

The other task before the Association was to help in solving the great problem of unemployment. Every industry in the country ought to be considering what contribution it could make to the future organisation of industry in order to wipe out the blight of unemployment. It would never be solved until the best minds, psychological, scientific and commercial could be brought into play towards a final solution, and joint bodies in addition to talking of wages and hours and all the rest of it might devote some attention to these other great national problems.

HELP THE BEGINNER IN INDUSTRY.

They were very perturbed at the extension of blind alley employment for the young fellows coming into industry. They were raising the school leaving age and this would produce a higher standard of young man and woman turned out by the schools, and industry would have to adapt itself to receive that higher standard of intelligence.

REPLY BY THE PRESIDENT.

Mr. A. E. Millard, the President, who was received with great enthusiasm, on rising to reply to the toast, said that, as they all knew, Mr. Bevin occupied a very high position in the transport life of this country.

Before proceeding with his reply he wished to say how very pleased all the members were to see their old friend Mr. Victor Brown with them again after his illness. (Applause.) Mr. Victor Brown was one of the pillars of their industry and they extended to him a very hearty welcome.

That was the second occasion on which the Association had met in Birmingham, the last time being in 1923 when they gathered under the Presidency of their good friend Mr. G. H. Price, and no Association ever had a better leader. (Loud applause.)

The usefulness of their Association to industry, continued the President, was indisputable, and it would be impossible to underestimate the value of their achievements, and from a discussion that afternoon it was clear they intended to pursue a progressive policy.

They had been considering the question of a new basis of constitution and election of the Executive Committee, the idea being to further improve their organisation by providing a closer link with members in areas and provincial centres, and it was expected that the future would prove the wisdom of the step they had taken. Their Costing Committee had tackled the economics of the industry so far as they related to road motor vehicles, and had advocated a certain system of costing. No one would question that uneconomic work was unhealthy, and they hoped that their efforts would result in improvement all round.

They had held recently an Estimators Examination but the number of candidates coming forward fell below expectations, and he hoped that the numbers forthcoming at future examinations would be a source of congratulation to the Association as they were actuated by a desire to promote their educational movement. It was also to be hoped that Centres would take up the important question of instituting educational classes and would receive support. Several Centres had conducted most successful courses and the Committee would be only too pleased to assist any Centre where classes had not yet been established.

Members had discussed that afternoon the question of adopting a registered design for the Association, and it was earnestly hoped that the matter would receive earnest consideration in order that a decision might be arrived at when they met in London in 1930.

The Association welcomed ideas from any member as to ways in which the value of the Association could be increased and the prosperity of the industry promoted. The Committee welcomed suggestions. Personal contact was a most successful method and he was glad to say that as a result of personal calls made by members new members were being secured.

He was sure that the Association could look with confidence to the future and it would continue to promote the interests of the industry and happy relations between members. (Applause.)

Mr. F. W. H. Winwood, the Chairman, submitting the toast of "Our Visiting Centres," said that the task was allotted to him on November 5th, and he was wondering whether April 1st would not have been a more appropriate date. (Laughter.) He was sorry that the task had fallen upon him because if there was anything he hated it was a job. He had always said that there were two things in life towards which he felt some antipathy and work was both of them. (Laughter.)

The Midland Centre realised that other centres had extended to the Association lavish hospitality in the past, and it was therefore a privilege for his Centre to do something to try and repay the kindness they had received in other districts. It seemed to him good that members should meet at such gatherings and a man must be dull indeed if he was not able to profit from close personal contact with other people engaged in the same industry. They had visited Brighton—"Oh, what a night!"

F. W. & R. A. BI-ANNUAL MEETING AT BIRMINGHAM.

Digitized by Google

(laughter) and they had also been to Scarborough, Manchester and Bristol, and had been entertained by the London Centre and last, but by no means least, they had been entertained lavishly at Bournemouth where they were received more like rich customers than ravenous competitors. (Laughter.)

He would like to gratefully acknowledge the work some members of the Midland Centre had done in connection with that meeting. Unhappily their good Secretary of the Midland Centre, Mr. Hartnett, who had worked very hard, was ill and unable to be with them. His old friend Mr. Walter Barber had done a great deal of work, in fact he thought he ought to go to bed or jail for the way in which he had neglected his business had been absolutely criminal. (Laughter.)

Mr. G. H. Good, Immediate Past-President of the Association and Chairman of the Southampton Centre, responding, congratulated the Midland Centre on a trinity of events. The Midland Centre had the distinction of being the first to entertain the Association at a bi-annual meeting for a second time; the first local Centre to be formed, their first Chairman being Mr. Ben Blower, and their first Hon. Secretary Mr. G. H. Price; and that was the first occasion on which the toast of visiting centres had appeared on the list at a banquet of the Association. (Applause.)

Might he express on behalf of representatives from other centres their delight at being present as the guests of the Midland Centre; such meetings created a fine feeling of good fellowship; greased the wheels of business intercourse, and awakened and cemented ties of personal acquaintance and knowledge, and that intimate and personal knowledge of each other was invaluable to them when dealing with difficulties which might arise. The Furniture Warehousemen and Removal business was so intricate and the difficulties they had to encounter and surmount so varied and perplexing, that one wondered how the industry was carried on in the old days without this interchange of experience and knowledge. One of the great benefits the Association ever bestowed upon its members was the introduction of the Local Centre idea, and they could indeed make it of immense service in dealing with local difficulties, and in a wider sense of service to the Association as a whole. Another great result of the work of the Centres was the elimination and prevention of unfair methods, and the more they met each other and got to know each other the more would they think before doing anything likely to hurt or injure a fellow member.

Everybody realised the amount of good derived from Centre meetings, but if Centres were to become the power they should they must be run on interesting lines, and must watch the local interests of members, and improve, by educational work, the knowledge of all, particularly with regard to costing and in the use of such things as tyres, lubricating oils, etc., and so give a better service to the public at the lowest price.

They had plenty of brains in the industry but sometimes they were mostly concerned with individual efforts, whereas some rationalisation of effort would result in a better return to themselves and a far better service to the public. They could only expect to get something out of the Association in so far as they were prepared to put something into it. His advice to all the Centres was to be lively and make themselves felt and heard, and the industry would be better for their efforts.

Mr. Victor Brown, the Hon. Treasurer of the Association, proposed the toast of "Our Guests," and prefaced his remarks with thanks to the President for his kind reference to his recovery from illness. He regretted very much that he had been unable to be present at the last annual meeting, the first he had missed since the inception of the Association. (Loud applause.)

Mr. T. H. Shipley (London, Midland and Scottish Railway), responding, said that on his way home a few nights before he passed a motor lorry belonging to one of their members and on the back it said "Keep Moving." That was a fine motto; they must keep moving to keep pace with the times. Speaking on behalf of the railway men of Birmingham, might he not say that the Furniture Warehousemen and Removers were their partners and the railwaymen wanted to be partners. As a railway man he did not fear competition; what he feared was uneconomic competition which was bad for everybody.

Mr. G. H. Price proposed a hearty vote of thanks to the artistes, particularly mentioning Mr. W. L. Barber who, with Mr. Harold D. Bloore, entertained the company with a selection from "Julius Cæsar." This was one of the outstanding items in an excellent programme arranged by Mr. Barber. Mr. Price also paid high tribute to **Mr. E. A. Harris,** the Secretary of the Association, who, he said, was a very energetic and able Secretary. Those on the Executive Committee and the various sub-Committees felt that they had a treasure in Mr. Harris and he deserved a special word of commendation and encouragement for the future. (Applause.)

London Traffic.

Government Policy.

IN the House of Commons, on December 2nd, in reply to a question put by Mr. Gosling, who asked whether the Minister of Transport was in a position to make a statement as to the policy of the Government on the London traffic question, **Mr. Herbert Morrison,** the Minister of Transport said: With the leave of the House, I will make a statement which the Prime Minister has authorised.

The Government have now examined the London traffic situation. We agree with the opinions expressed by the London and Home Counties Traffic Advisory Committee that no lasting solution of the dual problem of the congestion of the streets and the provision of proper facilities for the travelling public will be found unless further steps are taken towards eliminating uneconomic and unnecessary competition.

We also agree generally with the Committee that a far-reaching measure of unification under public control is essential to progress and that on the other hand "given unified management, and efficient operation of the various passenger transport agencies in the London traffic area, there is little doubt that the consequent elimination of the present wasteful competition would result in sufficient revenue being obtained from the operation of the several undertakings at the present level of fares as to leave, after meeting all legitimate claims and obligations, a margin available to attract fresh capital sufficient to provide for a programme of steady and continuous development of the traffic facilities of the area."

The object, then, must be to bring about, so far as possible, a co-ordinated system of passenger transport so managed that earnings shall be sufficient to meet all proper charges, including reasonable remuneration of capital.

We have given the closest attention to the form which the pooling of resources and co-ordination of management thus indicated should take, and we have come to the conclusion that the ends in view can be fully achieved and that the public interest can be fully safeguarded only if existing sectional financial interests are consolidated by the substitution of a single and simple form of public ownership for the complicated network of separate interests, private and municipal, which now add so greatly to the difficulties of the situation.

We shall, therefore, proceed at once to explore with all the interests concerned, and with the assistance of an eminent chartered accountant, a plan for the complete consolidation upon fair and equitable terms of the passenger transport agencies now providing services by omnibus, by tramway or by local railways in the London traffic area. We hold that in any such scheme all the existing municipal interests should be included from the start. The relations to be established between the consolidated enterprise and the amalgamated railways is an important point which merits and will receive careful consideration.

While the Goverment have decided that the principle of public ownership should be applied, they desire to make it clear that their intention and aim will be to assert and effectively to provide for the principle of commercial management of a self-supporting, consolidated transport system, thus ensuring the advantages of vigorous business enterprise. We take the view that with efficient management the potential earnings of London passenger traffic, fully co-ordinated as we propose, are such that no form of liability need be entailed upon public funds or public credit, and upon that assumption we shall proceed.

In conclusion, I would add that in view of the intricacy of the matters to be pursued no further statement is to be expected for some time.

London Cartage and Haulage Contractors' Provident Institution.

Annual Dinner.

HEAVY calls made upon it in the past and the helping hand always extended, the almost certain prospect of more urgent calls being made in the immediate future, the London Cartage and Haulage Contractors' Provident Institution, the functioning of which depends absolutely upon the support and generosity of members of the Industry, looks back with pride to its achievements and hopefully towards the future, confident that its activities will not be restricted for lack of support.

SIR WALTER GILBEY, BART.

For sixty-five years this unique Institution, founded with the object of aiding the aged and necessitous members of the Industry and their dependants, and maintaining, clothing and educating the children of such members, or of deceased members, where conditions warrant such assistance, has carried on its beneficent work and has never turned away any who have asked for help and sympathy.

We commend the Institution to our readers—its help will be needed more in the future even than in the past. The trade will see that it does not falter.

Contributions, which will be gratefully acknowledged, should be sent to the Honorary Secretary, Mr. R. P. Bailey, at 17 Water Lane, Great Tower Street, London, E.C.3.

The Annual Dinner of the Institution was held at the Connaught Rooms, London, on November 26th last.

THE INSTITUTION.

Sir Walter Gilbey, Bart., presided, and submitting the toast of "The Institution" said it gave him great pleasure to propose success to the London Cartage and Haulage Contractors' Provident Institution. He felt it to be a great honour to be invited to take the Chair at that gathering, and perhaps one reason why he had been so honoured was because all his life he had been deeply interested in and associated with their good friend the horse. (Applause.) There could be no other reason.

He would like to congratulate the President and Committee upon their wisdom in inviting ladies to attend. Feminine influence was an enormous asset when funds had to be collected, and beauty and benevolence always went hand in hand. He visualised the time when a lady would occupy the Chair at their Annual Banquet, and the Committee would see it was so when they appealed for funds for their magnificent Institution.

The transport industry was one upon which every trader in this country depended. Our commerce depended upon transport, and as a business man he was grateful for what the industry did for the business men of the City of London. Those engaged in transport did their work magnificently, and in their hands lay almost entirely the prosperity of the country. The producer and the consumer had to come to the transport industry for help without which they could not possibly continue in business. In his opinion people did not realise sufficiently the importance of transport to this country, and how much they were indebted to gentlemen like Sir Henry Maybury who had done so much for them. (Applause.)

All were deeply concerned regarding the prosperity of this country, and the overwhelming burden we had to bear in the form of taxation and restrictions was making business difficult and in many cases almost impossible.

One of our great traditions, of which all were very proud, was benevolence. No matter what were their trade rivalries they joined together in endeavouring to assist those who had fallen upon evil times, and it was a grand thing for those who had been successful in life to know that they were able to bring some little happiness and comfort into the lives of the less fortunate, and he would be very proud indeed if their generosity that night created a record.

There were two classes of people in this world, the born givers and the born takers. They would prove the truth of the existence of the former by showing the utmost benevolence and generosity. He most earnestly pleaded from the bottom of his heart for support for their magnificent Institution which had done and was doing such good work. It was an Institution to be proud of, founded as it was in the year 1864, and he beseeched them to break all records that evening. (Applause.)

REPLY BY THE PRESIDENT.

Mr. P. R. Turner, the President of the Institution, responding, said he felt it was a very proud honour to have his name associated with the toast, and also to have been elected President of the Institution.

It was a unique Institution, and he used the word "unique" advisedly, because it was the only Provident Institution connected with their trade in these islands, and he would not be surprised if he could say in the world. It was rather a striking thing that it was left to London alone to have a Provident Institution in connection with the haulage industry. The industry had always been in urgent need of such Institutions, but he thought it was generally true to say that there had not been enough money or organisation in the industry to give rise to provident institutions. The need for them was seen from day to day. Only the day before two applications for assistance came to his notice from members of the trade in London. Never had he thought that either of those applicants would ever have had occasion to apply to the Institution for assistance. They had heard that night from one of their singers that trouble often made the man. That might be partly true but was it not truer to say that trouble often broke the man.

MR. P. R. TURNER, PRESIDENT.

For the past 65 years the Institution had been able to lend a helping hand where it had been badly needed, and he thought that the trend to-day compelled them to look for still heavier demands in the future on the funds of the Institution, as although some people were apt to smile when those engaged in the haulage industry complained of the heavy burden of taxation, he could assure them that the heavy additional taxation imposed during the last few years had placed many people out of business, and it was a most serious thing.

He would give them a small idea of some of the benefits and help given by the Institution from time to time. Last year, unhappily, three of their pensioners passed on. They had been helped from time to time to the extent of over £1,100. To-day they had on the books of the Institution a pensioner who had received about £1,000; another had received practically £800 and another £600. Besides these there were many others receiving help. It would be a dreadful day for the Institution if demands were made upon it which it could not meet; therefore he looked to the generosity of the trade and their friends that night.

He thanked Sir Walter Gilbey for the very kind terms in which he had proposed the toast and the company for the way in which they had received it. Sir Walter Gilbey was a tremendous worker, and they appreciated his coming there to help them.

He could only hope that during the time he was President of the Institution it would be in every way successful. (Applause.)

Mr. J. H. Turner, proposing the toast of "The Ladies and Visitors," said he did not quite know why, in these days of sex equality, a distinction should be made between the ladies and the visitors. (Laughter.)

It was a great privilege to be permitted to submit the toast standing in his name.

To members of the industry the night of the Annual Banquet of their Provident Institution was always a very proud evening, and it was to the ladies that they owed so much of the success of their Institution, and they attended in such great numbers, not to enjoy a banquet, not for the sake of an entertainment nor even for a dance, but because of their desire to do something for their fellows whom they knew, only too well, would suffer were it not for the efforts of their Institution. (Applause.)

One of their artistes had been singing to them as to what it meant to hear the skylark singing and to see the sun; were it not for the benefits dispensed by their Institution he was afraid that many of the less fortunate members of their industry and their dependants would be deprived of some of the sunshine they were now able to enjoy.

They talked about their industry from the commercial point of view. What was commerce? If it was anything, then it was a fellowship, and if fellowship meant anything it was humanity. If they kept that in mind he was sure that they in their day and generation would accomplish something of which posterity would be justly proud and would welcome the reading of the history of an Institution such as the London Cartage and Haulage Contractors' Provident Institution. (Applause.)

He extended to the visitors a very hearty welcome. The Committee were gratified that they were permitted to entertain so many of their friends, and it was his pleasure to couple with the toast the names of Mrs. F. G. Bristow, Sir Henry Maybury and Mr. Geo. Monro.

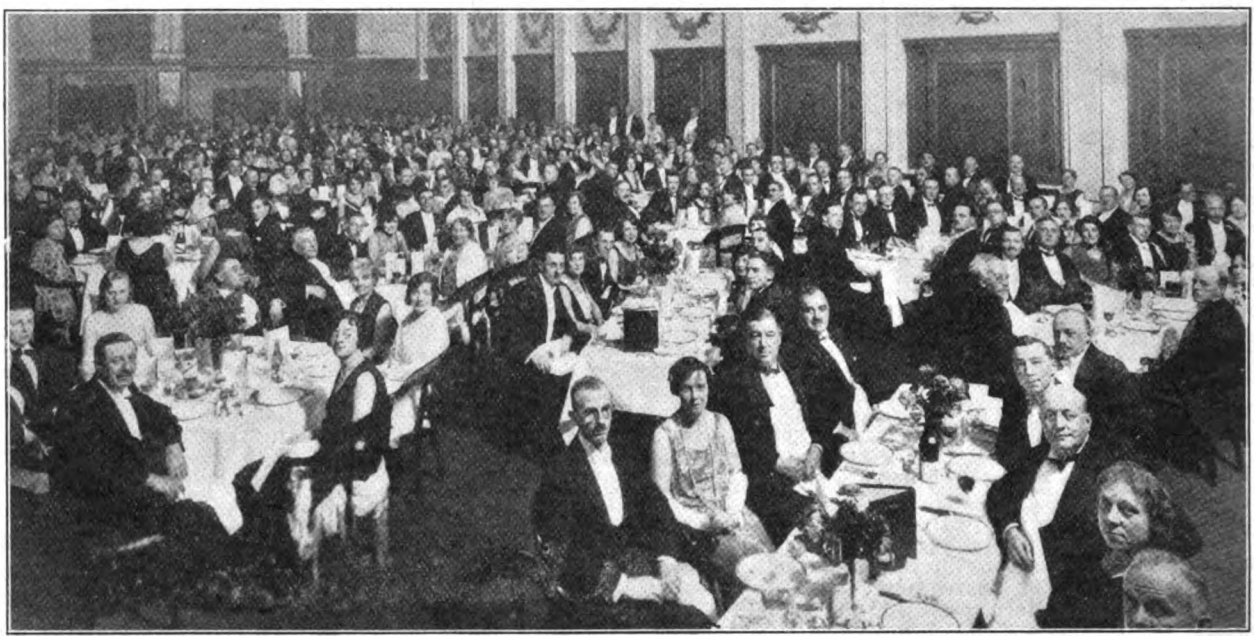
Mrs. Bristow, as doubtless they were all aware, was the wife of the very well-known General Secretary of the Commercial Motor Users' Association, and those who knew Mrs. Bristow could guess from whence her driving force came. (Applause.)

Sir Henry Maybury was one of the greatest friends the road transport industry ever had. (Applause.) Those who travelled on the roads, particularly around London and in the Home Counties, saw the work done by Sir Henry, which would stand as a monument to a great man, who realised what was needed now and for the near future, and it was good to know that we in our time had realised what was wanted and had made it possible for transport to flow, and, in spite of what was written in the press, to flow with great fluidity.

It was also his pleasure to welcome Mr. Geo. Monro, the President of the Commercial Motor Users' Association, which, perhaps, he might call a sister organisation. (Applause.)

He much regretted that he could not couple with the toast the name of Mr. Ben Smith, M.P., who, unhappily, was seriously ill. That night would have afforded an opportunity of lessening whatever breach there was between employers and employed, and he had looked forward to hearing Mr. Smith and to have paid tribute to him by saying that although they had been in opposition to him on many occasions they had always welcomed his sound wisdom and his ability finally to negotiate with them on behalf of the great number of workpeople whom he represented. Mr. Smith had always shown that he was a man who believed in giving and taking a fair deal. (Applause.) They could only hope that they would be honoured by the presence of Mr. Smith on a future occasion. (Applause.)

Mrs. F. G. Bristow, responding, said she would be brief but none the less sincere. On behalf of the ladies she would just say how very much they appreciated all that had been arranged for their pleasure that evening and how much they had enjoyed the hospitality of the Institution. They all thanked the Committee. "We women," continued Mrs. Bristow, "do realise how much your Institution has done in the past and we wish you great success in the future." (Applause.)



Photo] LONDON CARTAGE AND HAULAGE CONTRACTORS' PROVIDENT INSTITUTION. [Fradelle & Young.
ANNUAL BANQUET.
STANDING—LEFT TO RIGHT: MR. P. R. TURNER (PRESIDENT), SIR WALTER GILBEY, BART. (CHAIRMAN), AND MRS. P. R. TURNER.

Sir Henry Maybury, G.B.E., K.C.M.G., C.B., said he would like to add his tribute to that of Mr. J. H. Turner regarding their friend Mr. Ben Smith. Like Mr. J. H. Turner he had had the good fortune for some years of serving with Mr. Ben Smith on a not unimportant Committee and he could testify to his fairness, straightforwardness, and good fellowship and he wished him, as he was sure the company did also, a very speedy return to good health. (Applause.)

It had indeed been a pleasure to be associated with the London Cartage and Haulage Contractors' Association, and he had had the good fortune to have the assistance of their President, Mr. P. R. Turner, their Past-President, Mr. J. H. Turner, and their excellent Secretary, Mr. R. P. Bailey, for many years, particularly during the time when he occupied a highly respectable but poorly paid position in the civil service (laughter), and during days when the industrial situation was not quite so easy as it was to-day. He had indeed very good reason to remember their co-operation and whole-hearted support. (Applause.)

He knew how well their President conducted the affairs of their Institution, and he hoped that as a result of that banquet their Provident Fund would receive ample support. They were indeed doing a great work.

Mr. Geo. Monro, C.B.E., President of the Commercial Motor Users' Association said it was a pleasure to him to join in tendering the thanks of the visitors for the very enjoyable evening they had spent. The Commercial Motor Users' Association were deeply interested in the London Haulage Trade Benevolent Institution, because the C.M.U.A. had not a benevolent institution of its own. Whenever there was a matter of taxation or legislation to be tackled the London Cartage and Haulage Contractors' Association and the C.M.U.A. pulled together. He did not feel that he was a visitor as he saw so many friends present. In the Chair they had a representative of an older form of transport, their old friend Sir Walter Gilbey, the best Judge of a horse in the British Isles. (Applause.) Then he saw Mr. J. H. Turner a representative of the old and the new means of transport and a very active member of the London and Home Counties Traffic Advisory Committee.

There were some who through sickness or other misfortune had fallen by the wayside, and it was comforting to know that their Institution came to their aid, and he hoped that trade would improve sufficiently to enable their subscription list to grow every year, whilst the claims made upon their funds would get less every year.

The President proposed the health of the Chairman, Sir Walter Gilbey, Bart., and expressed to him the grateful thanks of the Committee for presiding. Sir Walter, he said, was still a very busy young man; he said "young" advisedly because he did not know anyone who had a younger heart. (Applause.) Their Chairman was very closely associated with the Shire Horse Society, and was its President during its Jubilee year. He was President of the National Horse Association of Great Britain, Chairman of the Cart Horse Parade Society, a member of the Council of the Royal Agricultural Society of England, a member of the Smithfield Club and Chairman of the Royal Agricultural Hall Company; he was also a race-horse owner and had met with no small success this year; in addition he was one of the finest judges of horse flesh in the country, and a famous shot.

The Chairman, responding, said he had spent one of the happiest evenings of his life meeting those who were so deeply interested in their great Institution. They had all thoroughly enjoyed the evening, and to show their appreciation he devoutly hoped they would make it a bumper evening as regards subscriptions. In the time in front of them greater calls than ever would be made on the Benevolent Institutions of this country and they must be prepared to meet them; therefore they must open their hearts.

Latest Developments in the London Midland and Scottish Railway Rolling Stock.

1st Class Corridor Brake Carriages.

AN entirely new line has been acquired for the exterior walls of the latest first class Corridor Brake Carriages for the L.M. & S. Railway Company, by means of lowering the windows, which are larger than usual; this has dispensed with the waist line, and the exterior lower panels being of steel, timber mouldings have been done away with. These cars are painted crimson lake and suitably lined with black and gold, relieved with vermilion. The interior of these cars is composed of four compartments, a lavatory and brake van. The corridor, which links all the various compartments, has Westinghouse heaters built into the walls of the cars and concealed by neatly designed flush metal covers, harmonising with the other metal fittings. A comfortable Wilton carpet covers the floor, and the walls are panelled with Indian Greywood. There is ample ventilation. On opening the double sliding doors one finds a restful compartment panelled in Greywood; the furnishings are bluish-grey; the metal work is satin brass. One can now get an intimate view of the countryside and enjoy its beauty through the vantage of the new windows. Each compartment is well equipped with a ventilator of novel design, which is easily controlled by a handle on the window sill. The next compartment is carried out in Chippendale lines with satin wood inlays in mahogany; a pretty blue carpet is a foil to the decorative textile on the seats. Silver metal finishing completes this compartment. The next compartment is panelled in walnut, and to suit the character of this timber, trimmings of blue facecloth are used, while the colours of the timber and trimmings are tastefully repeated in a specially woven hand loom rug. Oxydised silver fittings are here used. Heavy mouldings and massive inlays, old English oak treated and moulded into shape. produce the fourth compartment, a replica of an old, 16th Century room. Rose pink trimmings and lantern lighting complete the compartment. The carriages are electrically lighted, and each compartment has a table lamp, with an attractive shade of pink "Rayolite." The lavatory, of ample dimensions, has its walls furnished with green Vitrolite, relieved in black. All appointments, including a large full-length mirror, add to the comfort of a journey. Next, the brake van; this is equipped with all modern devices suitable to their purpose.

Automatic Traffic Signals.—The Royal Automobile Club advises motorists that automatic traffic signals are now in operation at Ipswich, and drivers passing through the town should be on the watch for them. The R.A.C. will be pleased to supply a list of all towns in England, Wales and Scotland where these light signals are working, on application to the Secretary, R.A.C., Pall Mall, London, S.W.1.

Bromilow & Edwards' New Premises.—Bromilow & Edwards, Ltd., the well-known Automobile Engineers of Bolton, have recently transferred the whole of their works and plant to new premises in Foundry Street, Bolton. The very much greater area of these premises is required in order to cope with the increasing volume of orders for the firm's product.

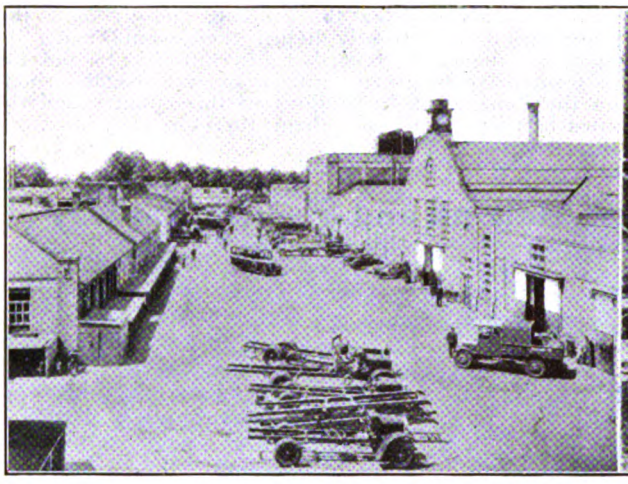
John I. Thornycroft & Co., Ltd.

Visit to Basingstoke.

ON Tuesday, November 26th last a party, numbering upwards of 150 persons, comprising commercial vehicle users and members of the technical and daily press, visited the works of John I. Thornycroft & Co., Ltd., at Basingstoke, to inspect the comprehensive fleet of passenger and goods vehicles which constituted the Olympia exhibit and some of which were staged at the Commercial Motor Exhibition. These vehicles, which were drawn up in front of the main buildings, gave a graphic idea of the wide range of vehicles manufactured by this well-known firm, from the largest double-deck omnibus down through single-deck buses, saloon coaches and goods vehicles built for the railway companies and for private users. After viewing these vehicles the party was divided up into groups and, under the guidance of representatives of the firm, including Sir John Thornycroft, Mr. Tom Thornycroft, Mr. Jack Thornycroft, and Mr. Roger Thornycroft, were shown round the extensive workshops, covering an area of 18 acres. These workshops are laid out on modern lines, with high grade machinery for making every part required in manufacturing motor vehicles and utilising the latest tools and the most up-to-date methods available, not only in this country, but in other parts of the world. Messrs. Thornycroft have not been content to follow the best practice in this country only, but both Sir John Thornycroft and Mr. Tom Thornycroft have travelled extensively in the United States, in South Africa, and in Australia in order to have first-hand knowledge of the requirements of the British Empire and to learn what is being done in the United States, the premier motor vehicle producing country. The photographs which we reproduce show some portion of various workshops, and we were particularly interested in seeing the very efficient way in which engines are tested and run in before being passed out and placed in the vehicles ready for the market. Every engine is given a thorough test for twenty-four hours at full speed and if it is not absolutely perfect in its working is put back for further attention and then tested again. This is only one of the instances of the thorough way in which vehicles are made and for which Messrs. Thornycroft have a worldwide reputation.



VIEW OF YARD.

PART OF ONE OF THE MACHINE SHOPS.

The visitors were then taken to the special rigid six-wheeler vehicle testing ground, where, under what would be considered in the ordinary way heart-breaking conditions, these vehicles were put through their paces and came out with flying colours. The ground, which has been specially selected and prepared to reproduce the worst possible conditions, had been still further adapted for its purpose by heavy rains and was a sea of mud, interspersed with obstacles. The vehicles carried through their tests with the greatest ease, climbing hills where the gradient was 1 in 3 and manœuvring in a way, under the skilful guidance of the drivers, which filled the audience with amazement.

After this demonstration the visitors were entertained to luncheon in the spacious canteen, following which Sir John Thornycroft and Mr. Tom Thornycroft, in expressing their pleasure at entertaining the party, referred to the large number of different vehicles which they were Thornycroft vehicles, in which the firm take a considerable pride, and to see among them the first steam vehicle produced by the firm in 1895, which was illustrated in our twenty-fifth anniversary number last October, and which appeared in the Lord Mayor's Procession last month.

building and asked for suggestions from users as to the best type of vehicle for their purpose, with the assurance that if they received this information they would make the required vehicle.

We were interested to see also the museum of ancient

The visitors before leaving were presented with an illustrated brochure as a souvenir of their visit, giving a brief history of the firm from its foundation in 1864 by the late Sir John I. Thornycroft, the original works being at Chiswick.

Round the Manchester Associations.

Manchester Transport (Owners') Association. — Good progress is being made with the co-ordination scheme of the Motor Coach Section of the Manchester Transport (Owners') Association, and at the present time, a survey is being made of the booking offices in the area. Some of them, situated at busy traffic points, and to which the police have lodged objections, may have to be closed. The Section is also considering the advisability of dividing the city into districts, so that inter-working arrangements may be made by the motor coach proprietors to prevent overlapping. The Trade Administration Committee meets frequently, and is pushing forward with the detail work of the scheme to ensure its smooth working early next season.

Manchester Committee of Road Users. — The Manchester Committee of Road Users, held an important meeting on Thursday, 28th November, mainly to consider the scheme which has been approved by the Manchester City Council at the recommendation of the Traffic Congestion Committee, for the creation of one-way traffic routes in Bridge Street and King Street West, Manchester. Mr. H. Howard Robinson, A.M.Inst.T., reported that the Chief Constable of Manchester had just issued an order authorising vehicles standing in the parking places in the streets named below, not to show any lights:—Whitworth Street West, St. Ann Street, Gt. Bridgewater Street, Byron Street, Trafford Street, George Street, Chester Street, C.-on-M., Dickinson Street, South Street, Watson Street, Ardwick Green South. Other matters discussed were the various clauses in the Manchester Corporation (General Powers) Bill, 1929. There are ten clauses that particularly concern motor vehicle owners and road users.

Amalgamated Horse and Motor Owners' Association.— The next quarterly meeting of the Amalgamated Horse and Motor Owners' Association, and the Commercial Motor Users' Association, South East Lancashire Area (Joint Organisation), will be the annual meeting, the arrangements for which have been already tentatively discussed. The General Council of the Association has decided to hold the meeting early in March. Radcliffe is the suggested venue. The conferences of the Association are held in a different town each quarter. This has been found a useful means of stimulating local interest in the area activities of the organisation.

McKenna Duties Appeal.

"All Set for a March Forward," says Sir George Beharrell.

AN appeal for a definite statement that the Government did not intend to interfere adversely with McKenna Duties was made by Sir George Beharrell, Managing Director of the Dunlop Rubber Company, Ltd., at the annual motor show dinner in Glasgow of the Scottish Motor Trade Association. When you think of the motor industry, he said, you must not think only of those men who are employed directly on the manufacture of motor vehicles, but you must recollect the large numbers who are now, I hope, profitably employed in the distribution of those products and still greater numbers who are employed in the management and working of the fleets of vehicles now operating throughout the country, and when you have called all these to mind there still remains a vast army of workers dependent entirely on the success of this industry. The industry deserves well of the country. It deserves every encouragement which a benign Government can bestow upon it. A rebuff would not only be damaging, but totally undeserved and misplaced. I am not going to enter into political questions, Sir George continued, except to say that a sympathetic handling of the question of taxation at this critical period in our history might go far to assist in the solution of the problem of unemployment. Never have British manufacturers approached the extremely difficult question of export with such enthusiasm and determination. We are all set for a march forward, and a definite statement that the Government do not intend to interfere adversely with the McKenna Duties would go far to give us that fillip for which we are all waiting and which will send us bounding along on the road of prosperity. This would inevitably mean more and more men earning good and regular wages and more and more women relieved of the wearing anxiety as to feeding and clothing the children.

Amalgamated Horse and Motor Owners' Association.

Important Business at Oldham Meeting.

THE quarterly conference of members of the Amalgamated Horse and Motor Owners' Association, Ltd., and the Commercial Motor Users' Association, S.E. Lancs. Area (Joint Organisation), was held at Oldham, on 9th November. Mr. W. A. Knott presided, and there were also present, Messrs. I. Smith (Oldham); J. Taylor (Shaw); W. Smith (Oldham); J. Clegg (Radcliffe); G. Hulme (Rhodes Co-operative Society); W. Bardsley (Oldham Equitable Co-operative Society); L. Greenwood (Rochdale Corporation Cleansing Department); T. Elton (Rochdale); B. B. Sutcliffe (Rochdale); C. E. Pittman (Hyde); J. Butterworth (Oldham); H. Mills (Shaw); J. Howarth (Royton Co-operative Society); V. L. Morton (Mossley); E. G. Buckley (Hollinwood); T. Hinsley (Ashton); J. Wright (Shaw); W. Gee (Bury); J. Horrocks (Hollinwood); F. Gale (Oldham); A. Duckworth (Middleton); J. Woodhead (Leigh); J. T. Clayton (Oldham); Councillor W. Farnworth (Middleton); J. S. Howarth (Secretary).

Wages.—The Secretary (Mr. J. S. Howarth), reported that the position regarding the wages question and the United Road Transport Workers Association was still the same. He said that further meetings had been held, but no definite arrangements had been arrived at. Councillor Farnworth said that at the last meeting of the Joint Road Transport Council, the representatives of the Transport and General Workers' Union asked to be supplied with a list of members who were governed by the agreement made with them. He considered it advisable and in the best interests of all haulage contractors especially, that the Transport and General Workers' Union should be supplied with this information, and they, in return, should supply the employers' association with a list of firms where they had members, so that it could be seen how far the agreement was effective. The Conference approved the suggestion.

Royal Commission on Transport.—The Secretary reported that the Royal Commission on Transport had issued their first and second reports, which had been considered by the Area Committee of the C.M.U.A. Certain recommendations had been forwarded on to the National Council.

Farriers Charges.—The Secretary reported that a conference with representatives of the Bolton, Bury and Radcliffe districts of the Master Farriers Association had been held in Bolton, and as a result of the Conference, the Master Farriers representatives agreed to hold a joint meeting to consider the question of reducing their charges by 1s. per set for the shoeing of horses. Mr. Howarth said that he had not received any official communication since the meeting, and he, therefore, wrote to Mr. Robinson, the farriers' district secretary for Lancashire, Cheshire and North Staffordshire. The latter had telephoned that the Bolton Branch of the Master Farriers' Association could not reduce the price as suggested. The Bury farriers had had a meeting, but had not come to any decision.

Licensing of Motor Coaches.—Concerning the licensing of motor coaches, arrangements had been made in Manchester for the vehicles to be examined by an authorised engineer, appointed by the Corporation. In Oldham, Rochdale and Bury, licences had been granted, subject to the owners not running bus services in competition with the Corporation's local motor bus service.

Traffic Control by Light Signals.—The conference discussed the memorandum which had been issued by the Ministry of Transport setting forth proposals for the controlling of traffic by light signals. It was considered that light signals should not be used at crossings where there were severe gradients. The light signal at the crossing of Manchester Street and St. Domingo Street, Oldham, was referred to, and it was suggested that this was a place which was not suitable for this kind of signalling.

Proposed Manchester Corporation Bill.—The Secretary reported that the Manchester City Council, by a small majority, had resolved to put a clause in their Bill, for powers to stop vehicles from passing stationary tramcars, when depositing and picking up passengers. He said that this was the third attempt which had been made to bring this into operation.

GENERAL COUNCIL'S REPORT.

THE half-yearly report of the General Council stated that several meetings of the Lancashire and Cheshire Joint Road Transport Council had been held, and reports as to the working of the wages agreement, made with the Transport and General Workers' Union, had been considered from time to time. The men's representatives on the council lodged a complaint respecting certain members not complying with the agreement, and the employers' representatives pointed out that in the majority of cases where that was the case, employers could not meet the expenses of paying the rates of wages in accordance with the agreement, so long as outsiders, who were their most serious competitors, were allowed to carry on at very low rates of wages. It was suggested to the men's representatives that the best way for them to assist in the bringing about of the uniformity, was for them to deal with those outsiders who were not paying the recognised rate of wages.

The position in regard to the United Road Transport Workers' Association, regarding the districts of Ashton, Hyde, Denton, Oldham, Middleton and Littleborough, is not altered. Conferences had been held with representatives of the United Road Transport Workers' Association with a view to getting them to accept arbitration so far as the Ashton district was concerned. The United Road Transport Workers' Association accepted the proposition, provided they were allowed to place before the court an application for an increase in wages. When this came before the Joint Council for consideration, the representatives of the Transport and General Workers' Union stated that they could not agree to the application made by the United Road Transport Association for an increase of wages to go before the arbitration court, although they were agreeable for the agreement made with them to be submitted for the consideration of the Court of Arbitration. The position, therefore, remained unchanged.

Committee of Road Users.—The Manchester Committee of Road Users had had under consideration a proposal for the making of Bridge Street and King Street, off Deansgate, one-way traffic streets, and arrangements were being made to alter the tramlines, so that the traffic could be operated in a reverse direction to that now in operation.

Plying for Hire Licences.—Motor coach owners who run tours both short and long distances, have found themselves in a difficult position, owing to the decision in the Grey Motors case. Several authorities have been prosecuting motor coach owners in various districts, when they had advertised single bookings. It is essential that where motor coach owners advertise single bookings, they should make application to the local authorities for a licence to empower them to ply for hire. In Manchester, it is necessary for any motor coach owner making application to ply for hire, to have his vehicle examined by one of the authorised engineers appointed by the Corporation, and also get a form signed by the manufacturer of the vehicles or his agent. This has to be sent in with the application which must state where the owner intends to pick up passengers. In Rochdale, the position is somewhat different, as the majority of motor coach owners start their tours from the Town Hall Square, and arrangements have been made, with the approval of the Chief Constable, for a rota system to be adopted, and this has worked very satisfactorily during the past season. In Oldham, the licensing authority has granted licences to motor coach owners as long as they do not run a regular service competing with the Oldham Corporation buses or tram. This also applies in Bury and Ashton districts. It is in the interests of all motor coach owners that they should combine, because the position created by legal decisions for plying for hire, will have a far-reaching effect in the future business of motor coach owners. The Committee feel that all motor coach members should use their influence to persuade other motor coach owners to join the Association.

Slippery Roads.—Complaints respecting bad roads and the slippery nature of roads, have been dealt with by the Committee, and in nearly all cases have received prompt attention from the authorities interviewed.

Haulage Rates.—The railway companies have made a further reduction in the rate for the cartage of yarn from Oldham and surrounding districts to the Manchester docks, having reduced the rate to 5s. 8d. per ton. Representatives of the Association have conferred with representatives of the shipping companies, and have agreed on a rate so far as members of the Association are concerned, of 6s. 6d. per ton, which is 10d. per ton higher than that quoted by the railway companies.

Legal defence had been provided in 52 cases.

Licensing and Regulation of Public Service Vehicles.

Omnibus Owners discuss the Second Report of the Royal Commission on Transport.

A CONFERENCE convened by the Omnibus Owners' Association was held at Olympia, London, on November 12th last, to discuss the Report of the Royal Commission on Transport dealing with the Licensing and Regulation of Public Service Vehicles.

Mr. Frank Pick, the President of the Association, and managing director, London Underground Railways and London General Omnibus Co., Limited, presided. He said that the matter to be discussed was of vital importance to their industry.

The first legislative action dealing with public service vehicles dated back as far as 1847. In 1889 there was passed the Town Police Clauses Act, which dealt with horse drawn traffic. Therefore, the question of public service vehicles as we knew them to-day, had never yet been dealt with by Parliament.

As an industry, they were grateful to the Royal Commission for the great attention they had given to the subject, and for the manner in which they had received the suggestions of the omnibus owners and the consideration they had given those suggestions in drafting their Report.

In the main, he thought they could accept the Report, but it was important that it should be carefully considered.

Mr. R. J. Howley (director British Electric Traction Co., Ltd., and Chairman Standing Joint Committee of Mechanical Road Transport Associations), opening the discussion, said they should be gratified that the findings of the Royal Commission in regard to the general structure of the system which they proposed followed closely the line of evidence submitted by the Association. It was, he thought, an excellent example of what combination in regard to statutory matters could achieve, and the Report alone was sufficient, in his opinion, to justify the existence of the Omnibus Owners' Association.

The Commission proposed that the country should be divided up into large traffic areas, and suggested that there should be ten in England and Wales, and four in Scotland. Long distance vehicles operated through the areas of many existing authorities, and even with the new enlarged areas proposed, there would be many cases where services would overlap from one area into another. Yet he thought the suggestions met the case fairly well, subject to one or two minor adjustments, which could be discussed when the matter came forward in the form of a Bill.

The proposal of the Commission was that three Commissioners should be appointed to administer licensing in each area; the Chairman of each area commission would be a whole-time Officer, paid for his services.

The Minister of Transport would appoint the Chairman, and in the case of the other two, the Minister would appoint them after consultation with the principal local authorities in the various areas. The other two Commissioners, although equal in status with the Chairman, should not be whole-time Officers, but might receive such remuneration, if any, and expenses, as the Minister might determine. While generally he welcomed the proposal to appoint three area Commissioners, he thought it would be more satisfactory if the Chairman of each area was appointed to sit with two assessor commissioners, so that in the event of disagreement, the Chairman's decision would be final, subject, of course, to the right of appeal to the Minister. The two assessors, he suggested, should be appointed by the Minister from two panels. The first panel would be nominated by the local authorities, and the second panel would be appointed by the owners of licensed vehicles. He though it was one-sided that the second and third Commissioners should be appointed by the Minister after consultation with local authorities, as no mention was made of any consultation with those who used the roads and who provided the greater part of the money for the upkeep of the roads.

The Report set out a number of matters which had to be taken into consideration by the Commissioners, but nothing was said as to taking into consideration the work being done and the services which had been provided by existing omnibus owners, and he certainly thought that that part of the Report which said that in coming to a decision upon any application the Commissioners should have regard to (*inter alia*) the provision of adequate and efficient services throughout the area might have been drafted somewhat differently, so that when considering the provision of additional services the Commissioners should take into consideration the work and duties performed by existing omnibus owners working on a route.

With regard to the definitions of public service vehicles adopted in the report, Mr. Howley said that the term "express carriage" was defined as a motor vehicle carrying passengers for hire or reward at separate fares and for a journey or journeys to some one or other common destination specified beforehand, and not stopping to take up or set down passengers other than those taking the specified journey or journeys, and motor vehicles carrying passengers for hire or reward at separate fares where no fare is less than sixpence. He did not think he would disagree with the first part of the definition, but the second part "motor vehicles carrying passengers for hire or reward at separate fares, where no fare is less than sixpence," was quite unworkable. Certain licensing authorities had made the minimum fare for "express carriages" very much in excess of sixpence, in the case of Birmingham it was 2/6, and they could well see that those who were providing local services would be seriously injured with a fare restriction on an "express" vehicles as low as sixpence. He did not like the words "express carriage," and would prefer to see a vehicle called a "limited carriage."

Digitized by Google

The Commission proposed that vehicles seating less than nine persons should remain under the control of local authorities. A good deal of damage could be done to an omnibus service by a vehicle carrying eight passengers, and he thought the Association should strongly press for the figure nine to be reduced to seven.

With regard to the licensing procedure, the first thing they would have to do would be to submit the vehicle to an expert and obtain a certificate of fitness, and if they wanted to use it as an omnibus or contract carriage, they must obtain a Public Service Vehicle Licence, and then a route licence was necessary in the case of a stage carriage before the owner could use it on a particular route, but it was at the option of the Area Commissioners whether they would require an express carriage to carry a route licence. He felt certain that if it was left to the Area Commissioners to decide whether they would require an express carriage to carry a route licence, it would be difficult, as he was afraid that in order to provide for congestion at seaside and other resorts, the Area Commissioners might require express carriages to take out route licences.

A stage carriage licence would be issued by the Area Commissioners in whose area the business of picking up originated, but if the service went into another area, the licence would have to be backed by the Area Commissioners in the second area.

A time-table was a highly technical document, and could only be drawn up by one with expert knowledge of traffic. It was proposed that time-tables must be submitted to the Area Commissioners for approval, and then displayed inside the vehicle. In this connection he thought that the Association should press the recommendation it had made to the Minister of Transport in connection with the draft Road Traffic Bill, viz.:—time-tables should be deposited so that if there was any question of services clashing, etc., the Area Commissioners should make their representations to the operators within seven days.

The report proposed that the Commissioners should have power to satisfy themselves that fares were reasonable, and he did not think owners could object to that, and if representations were made to the Area Commissioners, and if they considered it necessary in the public interest, they might, after holding a public enquiry, fix maximum and minimum fares for any service in their area. He felt that if owners were to get some form of protection for regular services from competition, they must expect some form of control over fares, but that control should be as wide as possible, and should only be exercised when the Commissioners could show that the fares proposed to be charged were unreasonable.

It was proposed that local authorities might make regulations for preventing any vehicle from carrying passengers in a specified street or area and for prescribing routes to be followed within the district. This was a very retrograde step. The roads belonged to the public, and the greater part of the cost of the roads was borne by the owners of vehicles. He did not think it was right that any local authority should be given power to make regulations regarding routes.

Another recommendation was that it should be the duty of a holder of a Public Service Vehicle Licence to give notice of any accident to or failure of the vehicle which might affect the safety of passengers or others. They must try to get that regulation limited as far as possible to accidents which were serious or likely to be of a serious nature. They could not possibly report every little accident.

Mr. C. Taylor (Chairman and managing director, Crosville Motor Co., Ltd.), said the report was one of the most clear and concise that they had had for along time. The outstanding feature was the recommendation that there should be Area Commissioners in place of the numerous licensing authorities. If the proposals were adopted with regard to route licences, it would be definitely stated where a vehicle could go and what it could do.

With regard to the classification of vehicles, it would be noticed that a stage carriage could be used as an express or contract carriage, and it seemed that everybody would licence their vehicles as stage carriages. He thought that there should be one description "stage carriage."

In the summary of recommendations under the heading of Duties of Area Commissioners, paragraph 8, sub. paragraph D, it said, "The Commissioners shall have discretion to hear and consider representations from persons other than applicants, but it shall be their duty to hear and consider any representations which any local authority, passenger transport undertaker, or other body or person directly interested in or affected by the proposed service may desire to make, unless the Commissioners consider such representations to be frivolous." He hoped this would be more clearly defined, and that it would be definitely laid down that Area Commissioners were compelled to have regard to existing services on the routes unders consideration.

Under Section 14 (3) of the Roads Act, 1920, if a licensing authority refused to grant a licence, the applicant could appeal to the Minister of Transport. The Owners wanted that Act amended so that the Minister should be compelled to take into consideration other licensees on the route.

Mr. E. S. Shrapnell-Smith, C.B.E., pointed out the impossibility of having rigid traffic areas. Motor bus operation could not be carried on in rigid areas—there must be some fluidity.

Colonel Sydney E. Smith, C.B.E. (director, Bristol Tramways and Carriage Co., Ltd.), said that the Report started off with a reference to legislation passed in 1847; he suggested that it would have been useful if it had commenced with the year 1842, as the Railway Passenger Duty Act was still law, and operators were prevented from carrying a single excess passenger.

It would be seen from Recommendation XI, that operators had to pay more. For a Public Service Vehicle Licence, there was a fee not exceeding £2 2s., and Route Licences and licences for drivers and conductors would be issued at fees of 5s. each. He contended that they already paid sufficient to the Road Fund, and if the 5s. driver's fee was charged, then the ordinary driving licence fee should not be charged.

Recommendation XIV, proposed that powers should be given to all existing licensing authorities to make regulations regarding routes, stands and stopping places, such regulations not to become operative unless confirmed by the Minister after consultation with the Area Commissioners. There was no provision apparently for representations by the operators.

It was recommended that a public inquiry by the Minister should be obligatory in the case of accidents to public service vehicles involving death, but surely the attendance of an officer from the Ministry of Transport at an inquest should suffice, and it should not be necessary to incur further trouble and expense.

Mr. O. Cecil Power (traffic manager, Birmingham and Midland Motor Omnibus Co., Ltd.), said that as to the definition of stage carriages, so far as fares were concerned, the words "any or all of which are less than sixpence," should be deleted—a stage carriage should be allowed to ply anywhere along its route. As to "express carriages," instead of the words "where no fare is less than sixpence," the figure should be at least 2s. 6d., and he would like to see it 5s. Under the definition of contract carriages, it was stated that "provided that a motor vehicle adapted to carry less than nine persons, etc." Mr. Howley considered the number should be seven, but he (Mr. Power) thought it should be four or five—four for preference, five if they insisted (laughter). In many districts they had competition from the small vehicle, and it appeared that a local authority, if permitted to licence a small vehicle, would be able to defeat the objects aimed at by appointing Area Commissioners.

With regard to time-tables, he was in favour of some powers being given to the Area Commissioners, and they should have power to co-ordinate time-tables in cases where more than one operator was running on a particular service. The Commissioners should also have power to fix minimum fares in order to protect the tramways running in municipalities. He thought they would have trouble regarding the "backing" of route licences, and that made him of opinion that six traffic areas would be sufficient. With regard to the recommendation that neither a public service vehicle licence nor a route licence should be saleable or transferable in any circumstances, this seemed contrary to one of the questions the Commissioners stated was involved in their terms of reference regarding co-ordination. If operators were not allowed to buy up existing services, they would not be able to reduce the number.

Mr. H. England, O.B.E. (director, Lancashire United Transport and Power Co., Ltd.), said that owners could not be sufficiently thankful that the report had been presented in the form in which it had, and they owed a deep debt of gratitude to Mr. Howley and those associated with him, for the work they had done.

As to the Area Commissioners being empowered to fix maximum and minimum fares, in his opinion, road transport in the future must tend in the direction of monopoly, and the tendency of the report was to create monopoly, and therefor there must be some control.

Regarding the question of insurance against third party risks, personally, he did not believe in such insurance, as if a concern was financially strong enough, it paid them to carry their own risks. If a company could prove its financial stability, it should be exempt from the provision.

Mr. A. D. Mackenzie (director and traffic manager, Southdown Motor Services, Ltd.), said he thought that on the whole, the scheme put forward by the Commission was quite workable, although it might present some little difficulties.

Digitized by Google

Regarding the definitions of public service vehicles, it had been suggested that there should be only one category of public service vehicle, but no doubt some owners would wish to have some vehicles licensed only as contract carriages. There were many vehicles working as contract carriages, and omnibus owners did not wish to see them licensed as public service vehicles, and so to run in competition.

The question of what conditions would be attached to route licences might be critical. He took it that the Area Commissioners could attach to a route licence for an express carriage the condition that the minimum fare in a particular area, or on a particular route, should be increased from 6d. to 2s. 6d. or 3s. If that were so, it would meet the difficulty of omnibus owners. A number of licences had been granted in one of the southern areas to run at a minimum fare of 3s., and it was working quite satisfactorily.

With regard to the submission of time-tables, this would tend towards co-ordination, which was really wanted.

Whether or not they liked the idea of having to submit a schedule of fares, if they were going to have practically a monopoly, they must admit that there should be control. The man in the street thought at once of the control of his fare, and he thought that the Area Commissioners would see that it was not possible to run services at some of the fares the man in the street would like to see in force. He thought it should be clearly defined what accidents were reportable. As to licences not being saleable or transferable, he rather welcomed this proposal, and although it would make some difficulty for them, it would stop the practice of starting a service with the sole object of having it bought up by one of the larger companies.

Sir William G. Lobjoit, O.B.E. (member of the Royal Commission on Transport), who was invited by the Chairman to deal with some of the considerations which led to the recommendations contained in the Report, said they were arrived at by a process of gradual elimination of proposals made to them, which, on careful examination, proved either to be unworkable or unacceptable.

The Commissioners realised that their first duty was to consider the interest of the public. Then there was the balancing of the views of the operators on the one hand, and the local authorities on the other, and no one wanted to surrender any principle. Finally it became a question as to whether the area licensing authority should be a single Commissioner sitting alone, or whether he should be the President of a sort of court. The question of assessors was considered, but it was thought there would be benefit in having a triumvirate, each member having equal status. This would prevent personal idiosyncrasies becoming stereotyped in one area. The idea was to have a court which would act judicially.

The definitions of public service vehicles followed largely those contained in the draft Road Traffic Bill. The idea was that the stage coach should be the foundations vehicle as more exacting structural requirements would be required for it than for the others. As to the minimum fare of sixpence in the case of express carriages, it would be remembered that in the draft Road Traffic Bill 3d. was suggested, and the Commissioners thought they were taking a big step in doubling that amount.

With regard to time-tables, the idea was based largely upon practice in Northern Ireland. Maximum and minimum fares would not be fixed until there had been a public enquiry, and he thought that minimum fares would be fixed only in cases where a local authority which was providing a tramway or omnibus service could prove that the competition from other omnibuses at lower fares was seriously damaging their interest, and the interest of the ratepayers whose money was invested.

With regard to the recommendation that conditions should be attached to route licences regarding hours, wages and conditions of service, they would remember that a fair wages clause was inserted in public contracts, so that the recommendation was following precedent.

It had been suggested that in the case of a fatal accident, the presence of a representative of the Ministry of Transport at an inquest would be sufficient, but he would remind them that the coroner had only to decide how death was caused, and his inquiry did not cover other questions which might disclose information that would be of great help to providers of transport and users of the roads.

The Chairman said that the points raised would come before the Council. He thought it was agreed that the report represented a considerable advance on present practice, and operators would be glad to see, even at the expense of some of their present freedom, some better system of regulation and control established.

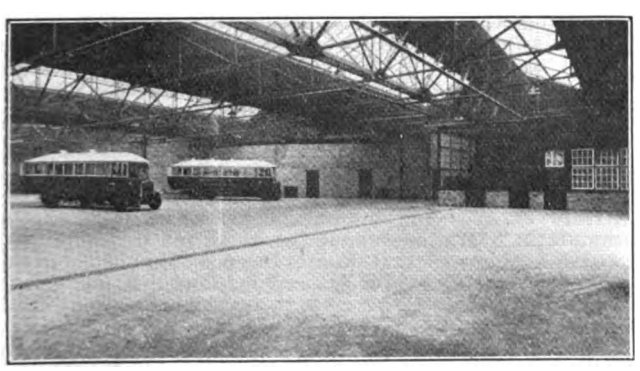
Those now engaged in providing transport services should have prior consideration in connection with the various recommendations set forth in the report. If area Commissioners were appointed, they should act judicially; they should be business men able to consider the facts put before them and to give a judicial decision upon those facts. It would be a mistake if the Area Commissioners were men with technical or special qualifications as all the technical aspects of a problem could be put before them in the same way as in an ordinary court of justice. They did not want Area Commissioners who would attempt to manage the business of the operators for them.

The Minister of Transport in the last Government established a useful precedent when he circulated the draft Road Traffic Bill, and invited criticism. Might he suggest that the present Minister should circulate a revised draft Road Traffic Bill to interested parties in order that they might consider its terms and prepare draft amendments. on points which they wished to bring under his notice.

A vote of thanks to the Chairman for presiding, proposed by Mr. O. Cecil Power, and carried with acclamation, concluded the proceedings.

New Motor Bus Garage for the Northern General Transport Co., Ltd.

A fresh step in the development of the extensive motor bus system of the Northern General Transport Co., Ltd. (and its subsidiary, the Jarrow and District Electric Traction Co., Ltd.), has been the erection of a large garage, with the requisite offices and stores, behind the Mile End Road at South Shields. An area of 22,800 feet is covered by the building, a special feature being the roof construction, which gives an entirely clear space over the whole of the floor. There is accommodation for 60 buses, and provision has been made for petrolling, oiling, cleaning and effecting minor repairs to the vehicles. The Hammond petrol installation, mechanically operated from a central distribution box, has a storage capacity of 10,000 gallons. Office accommodation is provided for the superintendent engineer, district traffic superintendent, and clerks; and there are also a conductors' paying-in room, ticket office, mess room, and drivers' tool lockers.



THE NORTHERN GENERAL TRANSPORT CO.'S NEW SOUTH SHIELDS GARAGE. VIEW FROM JUST INSIDE FRONT ENTRANCE.

Designed by Messrs. T. A. Page & Sons, architects, South Shields, and erected by Messrs. Wm. Hall, Ltd., Gateshead, the garage—which is the seventh of the company's service depots—has cost about £14,000, and incorporates all that is latest and best in construction. Among the interesting features on the opening day was a display of buses dating from the earliest types used by the N.G.T. Co.

Amongst those who attended were the Mayor of South Shields (Councillor J. W. Wood), the Mayor of Jarrow (Councillor W. G. Pearson), and members of the two Corporations, also of South Shields Rural District Council and Hebburn Urban District Council. They were received by Mr. J. Petrie (general manager), Mr. H. A. Stagg (resident director) and other officials, and, over the teatable, the former extended a cordial welcome to the visitors, the Mayor of South Shields responding.

Motor Hirers and Coach Services Association.

Discussion on the Reports presented by the Royal Commission on Transport.

THE Annual General Meeting of the Motor Hirers and Coach Services Association was held at Olympia, London, on November 12th last.

Mr. H. T. Rickards (Director of Charles Rickards, Ltd., London), the President of the Association, was in the chair.

The Minutes of the last annual meeting were confirmed and the balance sheet adopted.

Mr. H. T. Rickards was unanimously re-elected President for the ensuing year.

The meeting was convened mainly to discuss the First and Second Reports of the Royal Commission on Transport and to consider the effect on the motor coaching industry of an eight-hour day—forty-eight hour week proposed under the Washington Convention.

Mr. M. Logette (Managing Director, G.B. (Motor Tours), Ltd., and Chairman of the Management Committee, Motor Hirers and Coach Services Association) presented the Reports of the Royal Commission on Transport.

He said he only proposed to deal with those items in the Reports which, in the opinion of the Council, were of paramount interest and importance.

SPEED LIMITS.

The proposal of the Commission was that motor omnibuses and coaches, if all wheels were fitted with pneumatic tyres, should be permitted a maximum speed limit of 35 m.p.h., and it was a step in the right direction. In this connection he would mention that the Minister of Transport, speaking at the opening of the Commercial Motor Transport Exhibition, said he had seen it stated that motor coaches were to go at 60 or 70 miles an hour. He did not know, the Minister said, how those reports originated, and if they were merely intended as a manufacturers publicity stunt all was well, but that if any manufacturers were proposing to spend money on building coaches to travel at such speeds he would give them the tip not to waste their money, because coaches would not be allowed to travel as such speeds. The effect of stating, continued Mr. Logette, even for publicity purposes, that coaches could travel at 60 or 70 miles an hour might cause serious reaction, and he thought they were agreed that when the question came before Parliament there was every indication that the matter of the speed limits would be left to a free vote of the House. There was a good deal of prejudice against what he might term the poor man's carriage and this might be lessened if owners instilled into the minds of their employees that there were other people on the roads besides themselves.

COMPULSORY INSURANCE.

The Commissioners thought that the case for compulsory third-party risk insurance was so strong that an attempt must be made to deal with it. The Association approved the principle. The question of third-party insurance was dealt with from two different angles in the first and second reports. In the first Report the Commissioners recommended that insurance against personal injuries to third parties should be a compulsory requirement in the case of all mechanically-propelled vehicles, and in the second Report they stated that having regard to the fact that public service vehicles were operated for profit, the Commissioners approved of the proposal that the insurance policy should be extended to cover property. He did not quite see the argument.

The Commissioners referred to vehicles standing on the highway, and pointed out that the streets were intended for the movement of traffic of all kinds, not for the purpose of parking cars, and that amongst the worst offenders were the owners of long-distance omnibuses and motor coaches. "It appears to us" the Report stated "that these persons should be compelled to provide their own garages at the terminal points." It seemed to him, Mr. Logette continued, that there was a strong reminder to operators that they had to put their house in order with regard to parking places.

DRIVERS' LICENCES.

In the second Report it was recommended that drivers of public service vehicles should be over the age of twenty-one and conductors over the age of eighteen with a saving proviso for existing licensees. He had no comment to make on that but the draft Road Traffic Bill provided that a driver should be limited to a specific type, and he thought that in-so-far as express carriages were concerned the Association should support the view that once the man was a licensed driver of some type of express carriage he should be able to drive any type of express carriage.

Dealing with the definitions of Public service vehicles contained in the Second Report, Mr. Logette said that in the case of express carriages it was recommended that the minimum fare should be sixpence. In the draft Road Traffic Bill the limiting fare proposed was 3d. and the Association made strong recommendations to the Minister that it should be 1/-. The omnibus interests in their evidence before the Royal Commission made the serious allegation that owners of long distance vehicles were attempting to fill empty seats by picking up short distance travellers, and were thus seriously interfering with those who had the explicit obligation of providing rural and urban bus services. Whether the allegation was true or not he could not say, but if the limiting fare was raised to 1/- it would widen the difference between a stage carriage and an express carriage. Some of the omnibus owners were in favour of a still higher limiting fare.

The Commissioners proposed that England and Wales should be divided into ten traffic areas with four for Scotland. For each area there would be appointed three Area Commissioners, the Chairman being appointed direct by the Minister of Transport who would also appoint the other two after consultation or on the recommendation of the principal local authorities. This was a hopeful change from the present system. A year or two ago the Ministry of Transport did not seem to think much of the idea of the Association that the licensing of public service vehicles should be dealt with on a new basis, and they were told that their suggestions would mean the uprooting of the local government system.

Existing Local Authorities were to have certain powers regarding routes and streets to be traversed in their areas and as to stands and stopping places.

It was proposed that no alteration should be made in the existing law relating to the licensing of public service vehicles constructed to carry less than nine persons. Operators knew, said Mr. Logette, that if a licence could be obtained from the local authorities for an eight-seater it might be in a position to compete unfairly with those who had to apply to the Area Commissioners for licences, and he would like to see the figure of eight reduced to five.

ROAD LICENCES.

The draft Road Traffic Bill provided that any intermediate licensing authority whose area an express carriage traversed had the power to require the Road Service (Route) licence to be endorsed or "backed" by them. The Association made strong protests against this and he was glad to note that the Commission recommended that in the case of a service of express carriages such "backing" should only be required in areas in which passengers were taken up and set down. Yet it seemed to him that there was still a fly in the ointment and in his opinion the "backing" of a route licence should only be necessary in areas in which tickets were sold. If a party touring England desired to visit Windsor Castle it would be absurd to say that because passengers were set down and taken up there, that operators must have their route licence backed by the Windsor authorities. He appreciated that such was hardly the intention of the Commissioners, but they could not afford to have any doubt on the point. They had been living with doubts, contradictions and misinterpretations for many years and as the licensing laws would not again be in the melting pot probably within their lifetime he urged that all doubtful points should be cleared up.

There was another point with regard to the route licence. Two years ago long distance coach services hardly existed, and motor coaches were then engaged mainly in operating summer services and excursion trips, and he suggested that Route Licences should be divided into two categories, i.e. (a) regular long-distance services and (b) services of a seasonal, occasional or excursional nature.

The suggestion that Area Commissioners should have power to attach to route licences conditions regarding hours, wages and conditions of service had serious possibilities.

The Commissioners recommended that neither a Public Service Vehicle Licence nor a Route Licence should be saleable or transferable in any circumstances whatsoever, and in this connection they referred to the evidence they had received on the subject of the commercial value

Digitized by Google

which, owing to the restriction of competition, had, in recent years become attached to a licence to ply for hire with an omnibus, and on the highly undesirable practices which had arisen as regards speculation in licences. To meet the circumstances which would arise in the case of the death of an owner or operator the Commission thought that provision might be made for the issue of a Provisional Licence to the legal representative of the deceased, and that the Provisional Licence should continue in force until the next periodical review of licences by the Area Commissioners. Doubtless, said Mr. Logette, operators would have some views to express on that provision. Whilst he appreciated the principles that influenced the Commissioners in coming to that decision, he failed to see that the recommendation really provided a remedy for the evil, if the evil existed.

APPEALS.

Under Section 14 (3) of the Roads Act, 1920, there was a right of appeal to the Minister against the refusal of a licensing authority to grant a licence, and the Commission recommended that the right should continue. As to appeal procedure it had been suggested to him, continued Mr. Logette, that a change should be effected. Appeals were sometimes so informal as to border on irregularity. All sorts of irrelevant matters were allowed to be discussed; appellants could not enforce the attendance of a desired witness and could not always obtain a legal answer to a legal question. The Commission recommended that as regarded drivers' and conductors' licences the right of appeal should lie to a Court of Summary Jurisdiction, and he had heard it suggested that operators should have a similar right, but personally he thought it would be too costly, whereas the present system of appeal was within the means of everybody. In an appeal an operator, was, in a sense, fighting for part of his existence, and inquiries should, therefore, be carried out in as judicial a manner as possible. The appeal tribunal should be empowered to issue subpœnas and evidence should be taken on oath and the ordinary rules of evidence should apply.

LICENCE FEES.

Operators would have to obtain a certificate of fitness normally valid for a period of five years or some lesser period, a Public Service Vehicle Licence annually and a Route Licence annually, with drivers' and conductors' licences to be paid for annually. The Public Service Vehicle Examiners would have to be paid by somebody, and it seemed that the operator's road tax of £84 was but a minor detail. It was recommended that for a Public Service Vehicle Licence a fee not exceeding £2 2s. should be charged in respect of each vehicle, and that Route Licences and licences for drivers and conductors should be issued at nominal fees, say, 5/- per licence. There was no mention of the cost of a Certificate of Fitness. Personally, he did not think there should be any such thing as a Certifying Officer. They were told that Certifying Officers were to be appointed and paid fees on a prescribed scale in respect of the vehicles they examined, and they were further told, and it was important, that a Certifying Officer should be a properly qualified automobile engineer. They all knew what that should mean, and, with the greatest respect for that profession, they all knew what it sometimes meant. He recommended that the Association should endeavour to have inserted in any Bill the actual fee for a Certificate of Fitness. He advocated there should be no certificate and no fee.

They wanted laws that could not be misinterpreted. Let operators turn their faces to the future, and he hoped it was going to be a new and prosperous era for the industry and they must have, for a foundation, sound common-sense regulations for the licensing of public service vehicles.

During the discussion that followed it was pointed out that many services were being operated to-day on a non-paying basis and were only maintained because operators were afraid of losing the licences they held at present or might fail to get under the new regime. Operators should not be compelled to maintain non-paying services in the winter in order to ensure being able to carry the public during the summer. The Commission made it clear that they were aiming at the establishment of a controlled monopoly and it was that that operators had to fear. The proposal that licences should not be saleable or transferable in any circumstance was wrong, for what was a route licence if not the goodwill of a business. A milkman could sell his round so why should not a coach operator be able to sell his route licences which constituted his goodwill; such suggestion seemed to be bound up with the policy of a controlled monopoly. If, however, an operator was running a service between one industrial town and another he was serving the needs of business people and it was then necessary that he should maintain a regular service throughout the year, but there was no traffic to the coast in the winter to warrant a service being run.

The following resolutions were then put to the meeting and carried unanimously:—

That this General Meeting of the Motor Hirers' and Coach Services Association, being representative of coach operators throughout the country, urge that new legislation based on the first and second Reports of the Royal Commission on Transport, provide:—

1. That a licence to drive an express carriage should not be limited to a specific type of vehicle.
2. That the amount of fare denoting the difference between a stage carriage service and an express carriage service should be 1/-.
3. That in the case of an express carriage service the "backing" of a Route Licence should only be necessary in areas in which tickets for the journey are sold.
4. That in the case of express carriage services, Route Licences should be divided into two categories, i.e. (a) Regular long-distance services. (b) Services of seasonal, occasional or excursional nature.

WASHINGTON CONVENTION.

Eight-Hour Day—Forty-eight Hour Week.

Mr. R. P. Bailey said he had to put before the meeting a matter which, in the opinion of the Council, was even more serious for the industry than the question of the control of traffic on roads, and that was the Washington Convention, establishing an eight-hour day or forty-eight hour week.

The signatories to the Peace Treaty set up the League of Nations and a body called The General Conference of the International Labour Organisation comprising employers and employees or their representatives in their respective countries. The first conference of the International Labour Organisation was held in Washington in 1919, when the Washington Convention was signed, the proposals to be submitted to the countries concerned. The Convention was submitted to the British Parliament in 1921, when the House decided not to ratify it as conditions obtaining in the various countries were different. The present Government, however, had indicated its intention to ratify the Convention.

One clause in the Convention defined an industrial undertaking as including the transport of passengers or goods by road, rail, air, inland waterway, etc., and it was laid down that the working hours of any person employed in any public or private industrial undertaking should not exceed eight in one day and forty-eight in one week. It appeared that an owner driver and the managerial side of an undertaking would be exempt from the operation of the clause. It appeared also that if an employer was working a six-day week he could work eight hours for each of the six days, and if he wanted to work only a half day on Saturday, i.e., three hours, the remaining five hours of the forty-eight hour week could be worked on the other five days. If Saturday working was eliminated altogether the employer would only be able to do a forty-five hour week as he could only work nine hours in one day. Shifts could be worked of eight hours or a forty-eight hour week. The limit of an eight hour day and forty-eight hour week could only be exceeded by agreement between organisations of employers and employees.

Road Transport could not possibly be operated within such limits, and it meant that employers' federations would have to enter into negotiations with trade union organisations in order to comply with the provisions of the Convention.

A Bill to ratify the Convention had not yet been introduced into Parliament, and when it was it might be found to contain modifications, as he thought the Government would realise that some special conditions would have to be framed to deal with the road transport industry. Under the Convention overtime might be worked by permission of the Minister of Transport, supported by the trade unions, but overtime was not a recognised principle.

During the discussion that ensued, it was pointed out how impossible it would be to work long-distance coach services under the Convention as it stood.

The Association is taking every possible step to protect the industry.

A vote of thanks to the Chairman for presiding and to Mr. Logette for his address, proposed by Mr. L. Barter (Managing Director, City and Suburban Carriers, Ltd.), was carried with acclamation.

Some Further Notes Concerning the Commercial Motor Show.

THE Magnitude of the Commercial Motor Show this year, and the innumerable new developments, prohibit a general review such as would do justice to the exhibitors. Even stand to stand reports come far short of conveying clear impressions of what were to be seen on the stands. No doubt every critical visitor remembers some particular exhibit which impressed him more than others, but it is very unlikely that all would be agreed as to which was the outstanding feature of the Show. In our opinion, the most important development was the introduction, for the first time, of the diesel engine as a practical proposition for a power unit for industrial chassis. There were but four examples of this type of engine in the show, but even that number was sufficient to be significant. There was only one of British manufacture, namely, the McLaren-Benz, the others were the Berna, Mercedes and the Saurer.

Photo] [World's Carriers.

OLYMPIA COMMERCIAL MOTOR SHOW.
VIEW OF MAIN HALL.

Continental motor manufacturers have given a great deal more attention to the development of the heavy oil engine for transport purposes than have manufacturers in this country. In fact it is doubtful if British Manufacturers would have as yet been considering it, had not the foreigner demonstrated its practicability in so remarkable a manner. It is several years now since it first came to this country, and it has already given a good account of itself as a power unit for the road roller and vehicles of that class. The next step, of course, was to adopt it for ordinary road transport purposes, and if it gives as good account of itself in the latter application as it has done for the slower moving and heavier vehicle, it will do well indeed. We do not wish our readers to jump to the conclusion because of anything we say in favour of this type of engine, that it has reached a point of class efficiency equal to that of the petrol engine.

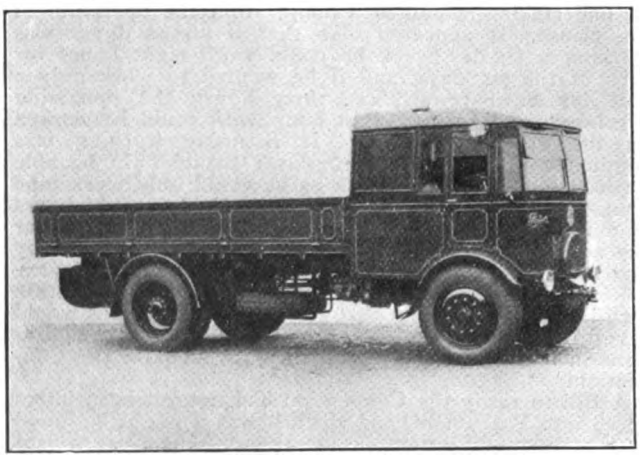
The present day petrol engine is the result of 25 to 30 years of the closest scientific research by innumerable engineers of the highest qualifications, and though the general design of the heavy oil transport engine follows closely that of the petrol engine, there will no doubt be found, as time goes on, a great number of improvements whereby the relation of power to weight in the heavy oil engine will come more nearly to correspond with that obtaining in the petrol engine. Several of our leading British manufacturers are already devoting a considerable amount of attention to heavy oil engine construction, and this in itself augers well for its future.

On the Saurer stand there was a six-cylinder heavy oil unit of particularly compact design. We cannot, of course, state with authority that this engine is a marked advance on other makes, but certainly, like the Saurer products generally, it was a very magnificent piece of engineering work. The compactness has been possible by the special type of crankshaft used, built up in seven sections. In place of the usual bearings, there are two circular plates bolted together with a peripheral floating ring running on roller bearings. These rings are bedded in the crankcase specially designed to receive them. The result is great economy in space as the greater diameter bearing is a great deal shorter than the more usual crankshaft bearing, and, furthermore, it is much freer running. This type of crankshaft is used in all Saurer six-cylinder engines.

Another feature of this engine is that it is of comparatively high speed for its type, running as it does up to 1,600 r.p.m., at which it develops 80 b.h.p.

The advantage of the heavy oil engine is remarkable economy in fuel cost. One of the principal drawbacks to its use at present is, we consider, the difficulty there would be in effecting repairs in the event of a breakdown. This, of course, can be overcome by the manufacturers organising first class service and also the objection will in time cure itself by ordinary garage proprietors and those responsible for its maintenance and adjustments becoming better acquainted with it.

The development of transport vehicles equipped with this type of engine is, we believe, regarded as a menace to the steam wagon. Our belief, however, is that it is the petrol engined lorry manufacturers who will have to "watch points," as the



THE FODEN "SPEED SIX" STEAM WAGON.

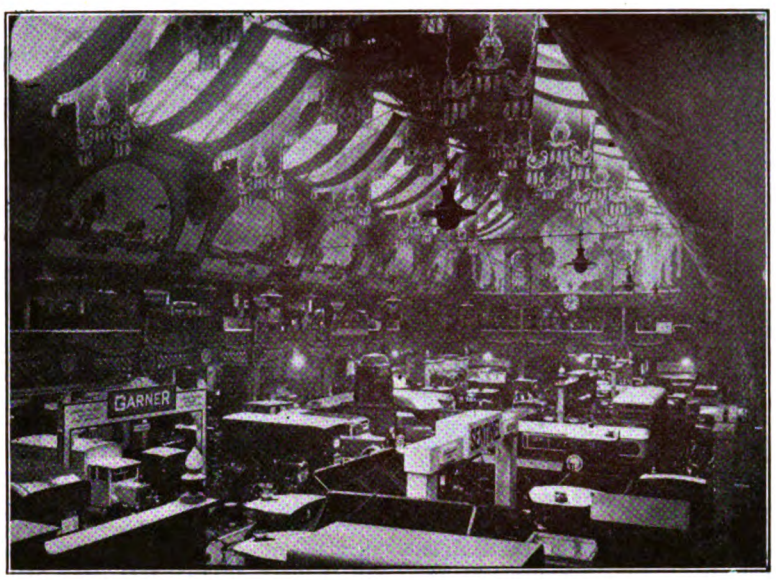
FRONT VIEW OF
THE FODEN "SPEED SIX" STEAM WAGON.

Digitized by Google

diesel engine shows a greater fuel economy as compared with the petrol engine than with the steam engine.

STEAM WAGONS.

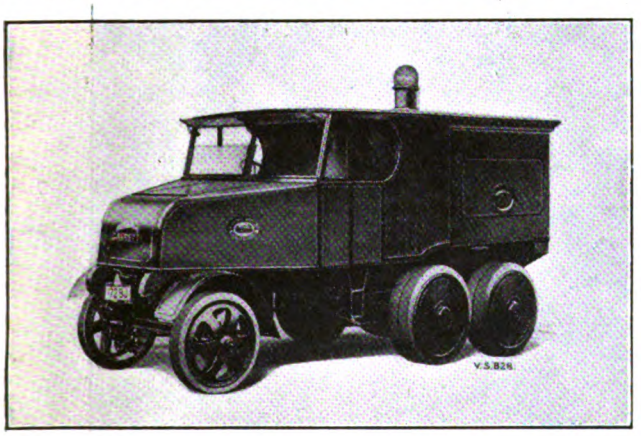
Though the steam wagon manufacturing industry was represented by only four firms, this cannot be regarded as an indication that the type of vehicle is falling into disfavour. Firms which have had the courage and enterprise to continue to improve design, are by no means lacking in support in the open market. Admittedly, steam vehicle manufacturers have suffered from exceedingly severe competition after having held practically a monopoly for many years in certain branches of the transport trade. As this competition began to be felt more keenly, some of the at one time well-known manufacturers retired from the business in despair, whilst others took their jackets off and set their backs to the wall, and have made a worthy fight which has done much to re-establish the steamer in favour in many important industries, such, for instance, as in public works transport, the quarrying industry, cement manufacturing, and various other industries where heavy transport is involved. As most of these industries are growing rapidly in importance, there should be no lack of demand for up-to-date steam lorries.



Photo] [World's Carriers.

OLYMPIA COMMERCIAL MOTOR SHOW. VIEW OF NEW HALL.

The outstanding feature of the steamer exhibits, was the Foden "Speed Six" wagon built to carry a useful load of 6 tons at 20 miles per hour. This vehicle is fitted with a medium high speed two-cylinder engine, 5 in. bore by 7 in. stroke, supplied with steam at 250 lb. pressure. It has a horizontal water-tube boiler with tubes set at an angle of 45 degrees. It is fitted with patent balance poppet valves of special design, cam operated, giving variable cut-off. There is a two speed gear, and the final drive is by propeller shaft to an over worm driven back axle. Cylinder lubrication is by special pump, and for chassis lubrication, the Tecalemit system has been adopted. The vehicle is mounted on giant pneumatic tyres 40 in. by 8 in. There is Ackermann steering, and the equipment includes an electric lighting set and a mechanical tyre pump. The vehicle has a particularly neat appearance and is not easily distinguishable as a steamer at first glance.



THE NEW GARRETT "SUFFOLK PUNCH" RIGID SIX-WHEEL STEAM TRACTOR.

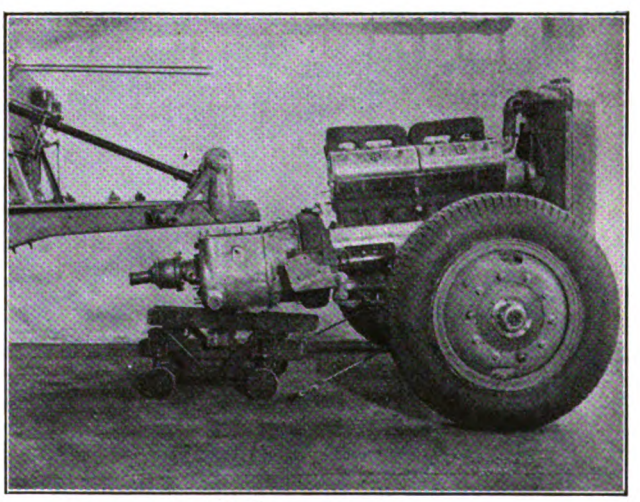
Another outstanding steam exhibit was the Garrett six-wheel "Suffolk" Punch tractor designed to haul loads of 30 tons on ordinary roads, or 20 tons across country. It is intended more particularly for overseas work. It is provided with a two-cylinder horizontal engine working at 250 lb. pressure. Power is transmitted through a two speed gear, and from thence by a pair of roller chains to the front wheels of the rear bogie. Chains also provide the drive from the front bogie wheels to the rear bogie wheels. The boiler is the vertical water tube type, and the short wheelbase is obtained by positioning the engine and gear case forward near the boiler. This tractor is also supplied as a four-wheeler.

With regard to the Sentinel wagons, there were no outstanding novelties. Readers of this joural are familiar with the type of engine employed, namely, two cylinders working at 275 lb. pressure with variable cut-off and two speed gear with the differential incorporated in the crankshaft.

Two excellent examples of Yorkshire steamers were exhibited, the special features of which are the compound vertical cylinder engine, the patent double ended loco boiler, and in the case of the six wheel models, the separate shaft drive to each bogie axle.

PETROL VEHICLES.

Turning now to the petrol vehicle exhibits: there being such a very large number covering practically every haulage requirement, and in capacities of from 3 to 4 cwt. to upwards of 20 tons, it is a practical impossibility to deal with them adequately. It is not fair even to compare them, as vehicles of equal capacity were on view, but offered at vastly different prices, so that it was not to be expected that the low priced models could compete in that refinement of finish to be found in the more expensive models. Nevertheless, the general standard of quality was certainly higher than anything we have hitherto seen. As examples of really superb engineering productions, we would cite the Maudslay 45/120 six-cylinder engined chassis. Type M.L.7, price £1,205. We imagine it to be well worth it.

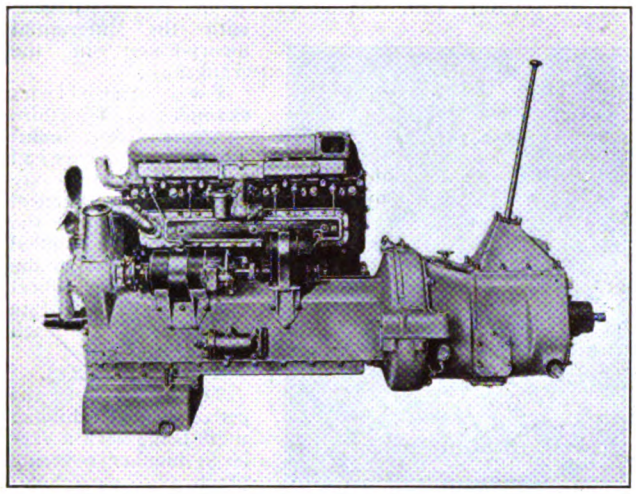


SHOWING EASY DETACHABILITY OF THE ENGINE AND FRONT AXLE OF THE MORRIS "DICTATOR" CHASSIS.

A newcomer to Olympia was the Morris Commercial "Dictator" chassis, and it attracted a very great deal of attention. It has been built to the design of Mr. Charles K. Edwards, the firm's chief engineer, who is to be congratulated on his achievement. The price is moderate, namely, £890. The chassis is suitable for a 28-passenger body. Accessibility is one of its strongest features. The power unit is easily detachable from the chassis, as may be gathered from the accompanying illustration, and the gear and clutch are easily detachable from the engine. The engine develops 56 b.h.p. at 1,000 r.p.m., and 110 b.h.p. at 2,600 r.p.m. The camshaft

Digitized by Google

is at the top of the cylinder casting and runs in an oil bath. The cams operate directly against rockers carried on the two heads, the rockers operate in turn directly on the valve heads. No brackets are used to carry the rocker shafts, these being bolted direct to the cylinder heads. Each rocker shaft carries two rockers, and is held in place by two nuts only, the removal of which enables a pair of rockers to be removed. The engine is described as the "high cam shaft" type, and it is in fact unique in design. The rear axle is of the underslung worm type.



THE MORRIS "DICTATOR" ENGINE AND GEAR BOX UNIT.

Another interesting 110 h.p. engined chassis was the B.A.T., the engine having eight cylinders, and is known as the "Straight Eight," manufactured by Harris and Hasell (1929), Ltd., Bristol. It was, we believe, the only eight cylinder engined chassis in the show. A feature of the chassis is the rubber insulation, rubber blocks replacing the customary steel spring shackles, and the sub-frame mounting and transmission line also are rubber insulated. It is provided with the "Lussy" outrigger frame, providing very low loading. The braking consists of twin cylinder hydraulic brakes, with an entirely novel patented system of progressive leverage. The price of this chassis at works is £850.

Thornycroft products need no introduction to readers of this journal, and their exhibits are always a centre of interest at the commercial vehicle shows. This year the centre of interest on the stand was the type J.C. rigid six-wheeled six cylinder engined 10-ton chassis. It has a four speed gear box and an auxiliary gear may also be fitted as an extra. A feature of the chassis is the bogie suspension, which has been designed to give even distribution of weight on all four wheels and freedom from spring distortion under all conditions of driving and braking, irrespective of the relative movements of the axles, in order to afford equal driving results from each wheel. Four inverted semi-elliptic springs are pivotted at their centres to brackets rigidly attached to the frame, and are mounted at each end upon the driving axles. The springs form the only connection between the axles and the frame. The suspension is designed to permit of 6 in. difference in driving axle levels. Excessive movement is prevented by rubber buffers above and below the axles.

Another most interesting vehicle was the F.W.D. six-wheel drive six-wheeler exhibited for the first time. It was fitted with an A.E.C. six-cylinder engine, developing 92 h.p. at 2,400 r.p.m. A four speed gear box is mounted unit with the engine and with the auxiliary gear box, eight speeds are provided. Both front and rear axles are of the fully floating bevel type. The bogie suspension is built to the War Office patented principle, and is designed for 18 in. free up and down movement of the axles without spring or frame distortion. We understand the drawbar pull of this machine is 12,600 lb.

Space forbids us going into further detail of exhibits, otherwise quite a great deal might be written concerning the excellent range of Albions, including a new model since the last show, this being a 24-seater bus chassis with a six cylinder engine. Also the A.J.S. "Commodore" chassis which has already been described in detail in *The World's Carriers.*

Bristol Tramways and Carriage Co., exhibited, amongst other models, a new six cylinder four-wheel chassis which attracted much attention. There was also shown a six-wheel six cylinder chassis, this too being a new product.

Amongst a very large range of Dennis vehicles, the centre of attraction was the new model known as the "Arrow" six cylinder chassis for a 32 seater body.

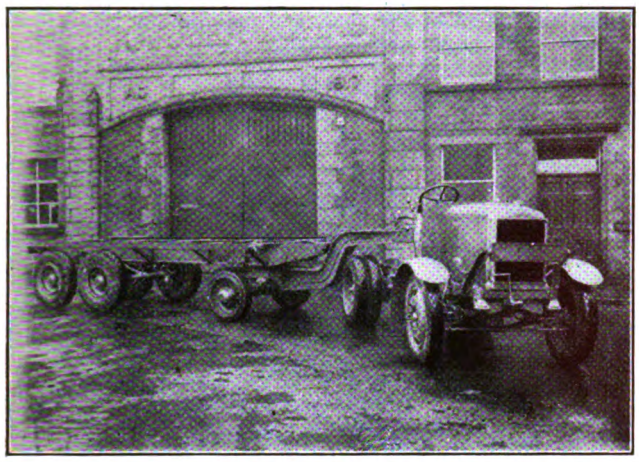
A THORNYCROFT 5-TON SIX-WHEELER ENGAGED ON AFRICAN TRANSPORT.

The Daimler chassis, as exhibited, has already been fully described in these pages. Perhaps the principal feature is the extensive use of aluminium alloy which has been used in order to reduce weight.

Dealing now with the more general features of the Show: we were much struck with the new form of development of the tractor trailer or articulated six-wheeler; either appellation seems to fit it. It is, in fact, a combination of a light motor, that is a motor weighing under 2 tons, and a trailer

Digitized by Google

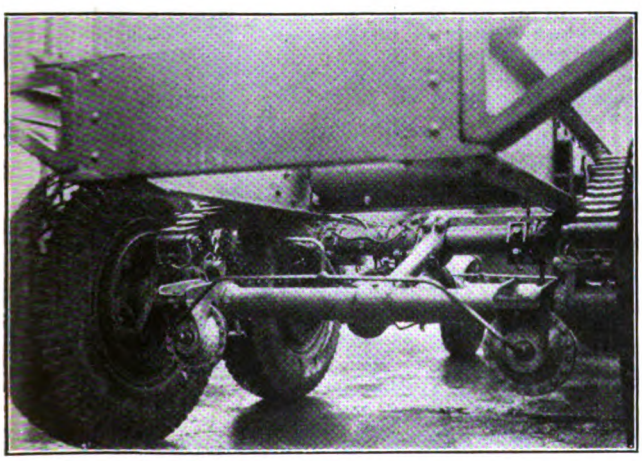
with either two, four or six wheels, but so constructed in the case of the four and six wheel models, that the front wheels may be raised from the ground and their load transmitted to the rear wheels of the tractor. This very interesting combination can handle loads of from 6 tons to upwards of 12 tons, according to the gearing supplied. Braking arrangements and automatic couplings between tractor and trailer have been most carefully considered. The combination is much favoured by railway companies and all those business firms who have heavy loads requiring quick transport. The tractor can be used, of course, in conjunction with two or more trailers. The tractor tax is £21 only, and the speed limit is the same as that for a private car. It is a remarkable development, and one which will extend as soon as its economy is appreciated. First class examples of these vehicles were to be seen on the "Karrier" and "Chenard Walcker" stands.



THE KARRIER "TT" COMBINATION VEHICLE. VIEW OF TRACTOR CHASSIS COUPLED TO 10-TON (SIX-WHEEL) KARRIER TRAILER.

RIGID SIX-WHEELERS.

With regard to rigid six-wheelers:—there are few firms now which do not provide them. The additional axle, providing as it does additional loading space and carrying capacity at minimum cost. The rigid six-wheeler is constructed for the transport of loads in a range of sizes from as little as 1 ton to upwards of 12 tons. It has the merit of reducing axle weight and the ability to travel over rough ground impossible to the four-wheeler; for this reason it is a favourite amongst overseas buyers, and is likely to become a great factor in the development of our Colonies and Dominions.



DETAILED VIEW SHOWING REAR AXLES OF 10-TON (SIX-WHEEL) KARRIER TRAILER.

TRACTOR DEVELOPMENT.

Another interesting development is that which had its origin in the agricultural tractor, and was represented at the exhibition by the Rushton, Latil and International, the Rushton being of entirely British construction. One feature of these machines is their robustness and compactness of design, and another is their adaptability for a great variety of purposes. As already stated, they were originally designed for agricultural haulage such as ploughing, and, indeed, for any class of haulage about the farm as well as for driving fixed machinery, and for this class of work they remain eminently suitable. The same machines to-day, by varying the wheel equipment, are equally suitable for road haulage, and, in addition, they may be equipped with shovel attachments for handling all kinds of loose material and loading it into trucks. This type of tractor may be termed the "handy man" in the motor transport trade.

TRAILERS.

Trailer development has been progressive for many years past either to use in conjunction with a special tractor unit, or to supplement the carrying capacity of the ordinary lorry, but recent years have seen much improvement in design so as to fit the vehicle for what are indeed extraordinary loads. In almost all branches of the engineering trade, increasingly heavy unit loads have to be transported and, as a rule, these units can be more conveniently transported by road than by rail, consequently, trailer manufacturers have paid much attention to load distribution over any number of axles, so that the danger of wheels sinking in roads not provided with adequate foundations, is reduced to a minimum.

A very striking example of this type of trailer was to be seen on the Dyson stand. It is built to take a load of 110 tons, and itself weighs 32 tons. It has a flat steel platform of massive construction fitted with rings and hooks for the purpose of securing the load, and the platform is supported on steel rollers on the two bogies. The trailer is provided with eight axles, each axle carrying two wheels, and each wheel is fitted with four solid rubber tyres 26 in. by 6 in., thus there are in all 64 tyres. Steering is through both bogies, so that the track of the rear bogie follows almost exactly in the track of the front bogie and the turning circle is consequently remarkably small. The wheels are universally fitted so that they adapt themselves to the irregularities of the road.

On the Dyson stand was also to be seen a horse box trailer of excellent construction, and the Eccles stand also had several equally first class examples of these popular vehicles.

BODYWORK.

Dealing first with passenger vehicle bodies, except in the matter of comfortable seating we cannot say that much progress has been made since the Commercial Vehicle Show two years ago. One would have imagined such items as buffet and lavatory accommodation would have been improved, having regard to the fact that long distance motor coaching is increasing in popularity instead of being dispensed with, except in one instance. Naturally, if it is possible always to be sure that the vehicles can be loaded to their full extent, the space occupied by these conveniences becomes valuable; but careful observation shows that this seldom is the case, a two-third load generally being regarded as a good one. One wonders, therefore, how many potential passengers refrain from making a journey by coach because of the lack of accommodation considered essential in every long distance railway coach. Otherwise, the luxury seating accommodation in long distance coaches appears to have reached a stage when it can no longer be improved upon for financial reasons.

There is room for improvement also in passenger vehicles, both of the local and long distance class, in the matter of getting rid of the exhaust fumes from the engine. How far this has been improved, of course, could not be judged at the exhibition, but during extensive coaching tours during the summer, we found this nuisance certainly very noticeable. Even opening windows did not seem to get rid of it, and it was worse in the front seats than in those at the rear, but the rear seats had the drawback of being more subject to jolting due to unevenness of the road and perhaps not very efficient springing, than those in the front. These are, of course, matters which only become apparent in actual service, that is to say, however comfortable a coach may appear on its stand at Olympia, it may be quite the reverse when travelling along the road. For long distance coach services the six-wheeled vehicle is not yet favoured to any extent by manufacturers, but we imagine it will have to come in order to provide maximum comfort for the passengers.

The general improvement of buses, both of the single and double deck description, was particularly apparent after having arrived at Olympia in one of London's buses! On the other hand the same thing is noticeable by comparison when either business or pleasure takes us to the provinces, where we find the public service passenger vehicles much in advance of those of the metropolis.

FREIGHT BODIES.

Concerning goods carrying bodies, no particular advance appears to have been made since the last Show.

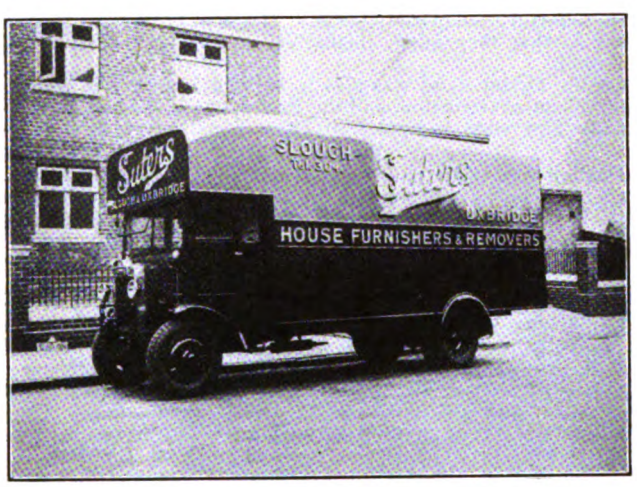
Tipping bodies remain practically as they were, and though there are no doubt improvements in tipping gears, the effect is just the same. On various occasions we have seen ingenious and apparently practical loading and unloading equipment but they do not appear to materialise.

Digitized by Google

There has been an improvement in the case of certain van bodies for light chassis for loads of considerable bulk in relation to weight. In this connection an excellent example is afforded by the Garner furniture van mounted on a 60/65 cwt. chassis, model J.O., forward drive, fitted with the Garner patent easily accessible engine arrangement. The inside dimensions of this body are 17 ft. long by 7ft. wide by 8ft. high, giving, with extra space above the driver's cab, 1,006 cubic ft. capacity. The vehicle complete, including all fittings, and even a mechanical tyre pump is priced at £795. It is claimed by the makers to give the greatest loading capacity of any body mounted on a similar capacity chassis on the market.

Excellent examples of modern refuse collecting bodies were shown on the Vulcan and W. and G. du Cros stands. The Eagle body, mounted on 2½ ton Vulcan chassis, appealed to us particularly because, by the utilisation of canvas instead of metal for the covers or doors, minimum effort is required to work them, and, moreover, when the cover is open to receive the contents of a dustbin, canvas curtains on each side of the cover protect the refuse from wind in practically any direction, and so the refuse is prevented from scattering.

The principle on which the model to which we refer is constructed, is that of a lever arrangement whereby when the dustman places his foot on a bar or pedal a few inches above the ground, the cover automatically opens and closes immediately his foot is removed. The body on the Du Cros stand, though similarly arranged, has the bar placed so that the pressure of the dustman's shoulder opens the cover. The covers are exceedingly light, being made of aluminium, and the construction and appearance are all that can be desired.



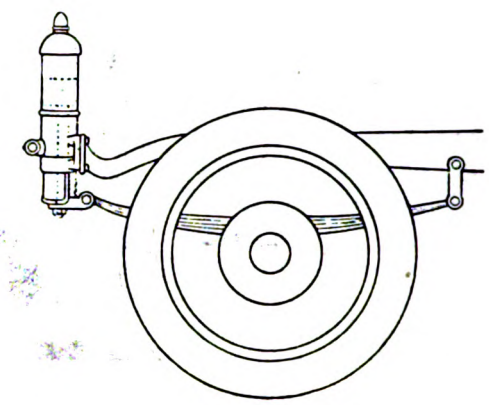
THE GARNER "JO" TYPE 1,006 CUB. FT. CAPACITY FURNITURE VAN.

MISCELLANEOUS.

The "Silentbloc" bush was an interesting feature of the T. B. Andre & Co., Ltd.'s stand. It consists of a rubber bush contained within inner and outer metal sleeves, the rubber bush is made of a larger external diameter, and smaller internal diameter than are finally required, the length, likewise, being considerably less than when forced into position. When forced into position, the outside diameter decreases and the inside diameter increases, and its length also increases. By this process a perfectly silent bush is provided, and no lubrication is required, nor can there be any rattle or squeak, it is suitable particularly for spring shackle bearings, brake gear joints and steering gear bearings.

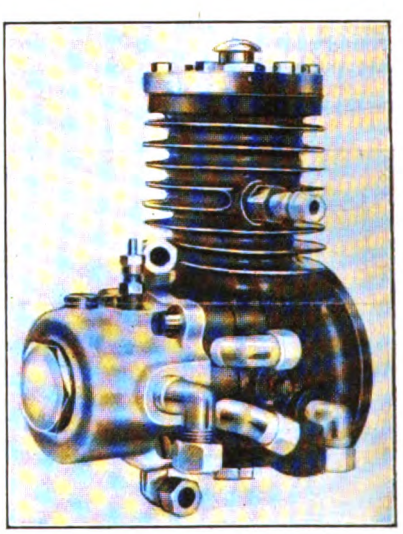
Another interesting bush was to be seen on the Hardy Spicer stand, known as the Compo. Compo is described as a die-pressed bronze bearing which has a porous structure forming a reservoir containing 25 per cent. to 30 per cent. of oil. It requires neither oil grooves nor lubricator hole. The lubricator may be placed against the outside of the Compo bush and the oil will pass in filtration form throughout every part of the bush providing a perfectly lubricated surface to the revolving shaft it supports. The slightest increase of temperature brings additional oil to the surface, thus providing additional lubrication. It is particularly suitable for water pumps, clutch pilots, brake assemblies and chassis bearings.

Our attention was drawn to the D. & B. clutch fitted to vehicles exhibited by Karrier Motors at Olympia. The manufacturers and patentees of this clutch are Dickinson & Bassett, 13/14 Fisher Street, Swansea. It provides a primary engagement taken by a spring controlled annular plate suitably lined, and is so designed to enable the vehicle to take the initial load with a total absence of "snatch" or fierceness. Although the primary plate will transmit sufficient power to enable the vehicle to be moved, it is not intended to transmit the full power of the engine. Consequently, the action of the primary plate will function in such a way that it is impossible for any fierce or harsh action to be set up during engagement. The secondary and final engagement of the clutch allows a positive drive to be obtained, and as the relative speeds of the driving and driven members are approximately the same, there is no possibility of any harshness being set up during engagement of the final drive. The primary plate, when engaged, definitely assures localisation of the cone, and nullifies any errors due to spigot wear or unsuitable angles.



SHOWING POSITION OF THE "GRUSS" AIR SPRING FITMENT.

The Gruss air springs were fitted to the Gilford chassis at Olympia, and it was the first occasion on which they have been exhibited in London. It is claimed that they reduce road shock by upwards of 34 per cent. They consist of sturdy telescopic cylinders mounted between the ends of the laminated springs and the frame. The portion attached to the frame is a rigid housing in which the piston attached to the steel spring, slides up and down. The air spring is inflated just as a tyre, through an air valve at the top of the housing. The piston rests upon the cushion of air. When a blow is delivered upon the wheel, it is transmitted to the spring. From there it passes to the piston and causes it to move upwards in the cylinder, building up the air pressure to absorb the blow.



THE HEYWOOD-J.A.P. COMPRESSED AIR STARTER.

An interesting compressed air starter was shown on the stand of the Equipment & Engineering Co., Ltd. It is supplied by J. A. Prestwich & Co., Ltd., and is known as the Heywood-J.A.P. high pressure injection starter, designed to provide an instant starter, adaptable to high powered internal combustion engines. Its weight for engine powers of from 50 to 800 h.p. is only 12 lbs. or, with a tank and piping complete, 28 lbs. It consists of a small automatic compressor with a compound distributor. The pump maintains a constant pressure in a small tank of a capacity of half a cubic foot of air at a pressure of 400 lbs. per square inch. By pressure on the starter button, compressed air is admitted to the cylinders on the power stroke. Simultaneously, a properly carburetted mixture is forced into the cylinders in cyclic order on the compression stroke. If ignition is in order, the engine will start with the first piston over the dead centre.

London Shipping and Forwarding Agents' Conference.

32nd Annual Dinner.

The Annual Dinner of the London Shipping and Forwarding Agents' Conference was held at the Café Royal, Regent Street, London, on November 25th last.

Mr. M. E. Duffett, the President of the Conference, presided, and among those present were:—

Sir Edward Crowe, C.M.G. (Comptroller General of the Department of Overseas Trade); Sir Geoffrey Clarke, C.S.I., O.B.E. (Deputy Chairman of the Council of the London Chamber of Commerce); Sir Ernest Benn, Bart.; Mr. J. Ballantyne (Chief Goods Manager, L.M.S. Railway); Mr. B. G. Arthur, M.B.E.; Mr. H. G. Bedell (Birt, Potter and Hughes, Ltd.); Mr. J. Blair (Nippon, Yusen Kaisha Co., Ltd.); Mr. G. J. Cowan (New Zealand Shipping Co., Ltd.); Mr. H. G. Crellin (Elder, Dempster & Co., Ltd.); Mr. C. M. Cummins (Cunard Steamship Co., Ltd.); Mr. P. Dance (Atlantic Transport Co., Ltd.); The Rev. Owen Davies; Mr. A. M. Dennis (Chief Continental Goods Assistant to the Chief Commercial Manager, Southern Railway); Mr. F. Edmeades (President, Association of Master Lightermen and Barge Owners); Mr. A. W. Heard (Chairman, British Association of Shipping and Forwarding Agents); Mr. W. H. Elder (Vice-Chairman, British Association of Shipping and Forwarding Agents and Hon. Secretary, Humber Forwarding Agents' Association); Mr. N. N. Bird (Vice-Chairman, British Association of Shipping and Forwarding Agents); Mr. V. H. Fenny (Freight Manager, P. & O. Line); Mr. A. L. Gibson (Continental Traffic Manager (South) L. & N.E. Railway); Mr. W. G. Guthrie (Trinder, Anderson & Co.); Mr. H. S. Gwyn (Bethell, Gwyn & Co.); Mr. J. A. Hawkyard (Anderson, Green and Co., Ltd.); Mr. W. Howard Horder (Union Castle Mail Steamship Co., Ltd.); Mr. G. C. Horton (Chairman, Liverpool Shipping and Forwarding Agents' Association); Mr. L. G. Johnston (Killick, Martin and Co.); Mr. R. W. Jones (Aberdeen and Commonwealth Line); Mr. H. B. G. Larkin (P. & O. Branch Service); Mr. A. de V. Leigh, M.B.E., M.A. (Secretary, London Chamber of Commerce); Mr H. P. Lumb (Chairman, Manchester Shipping and Forwarding Agents' Conference); Mr. J. Macmillan (Shaw, Savill & Albion Co., Ltd.); Mr. E. Morgan (Ellerman & Bucknall Steamship Co., Ltd.); Mr. D. J. Owen (General Manager, Port of London Authority); Mr. G. Saxon-Jones (Canadian Pacific Railway Co.); Mr. E. Shand (The American Merchant Lines); Mr. S. Sparkes (General Steam Navigation Co.); Mr. P. R. Turner (President, London Cartage and Haulage Contractors' Association); Mr. W. T. Caves (Secretary, Wholesale Textile Association); Mr. F. W. Challis and Mr. E. W. Willis, Editor, "The World's Carriers."

SIR GEOFFREY CLARKE, C.S.I., O.B.E.

Overseas Trade.

Sir Geoffrey Clarke, C.S.I., O.B.E., Deputy Chairman of the Council of the London Chamber of Commerce, proposing the toast of "Our Overseas Trade," said he felt somewhat diffident in talking about overseas trade to an audience composed of experts.

An island like ours was absolutely dependent upon overseas trade, and the problem we had to face was that of obtaining a regular, continuous and adequate supply of the necessaries of life for the very existence of our nation. To solve that problem was, he thought, only possible in one way, and that was to obtain our imports by offering in return our products and our services. We had to meet competition on every side, and the results of the war were with us to-day.

The Handicap of Tariff Walls.

Foreign countries had erected tariff walls because many found they could not compete in the world's markets unless they were highly protected, and it was those tariff walls that were such a tremendous obstacle to the development of our overseas trade.

Might he refer to one of the great results of the war, namely, the extraordinary condition laid down that allowed reparations to be paid in kind. Perhaps those who laid down that condition did not realise that by so doing they were conferring almost the greatest possible benefit upon the debtor country to the greatest possible injury of the creditor country.

Despite all obstacles, however, he thought it was very much to the credit of our British merchants, and spoke well for their salesmanship and organisation, that we still held a large proportion of the world's trade and were able to compete in foreign markets. Possibly there was room for improvement in our salesmanship, there was in everything, but Great Britain had a great advantage, namely, the high quality of her work. British goods held the field for quality everywhere, and another great advantage was her commercial integrity.

We had competition to face in our Empire markets. We had an advantage in imperial preference, and due to that we had been able to compete successfully in so many of our Empire markets, but it might raise the whole plane of our relations with our Dominions if every member of the great British Commonwealth, whilst fully safeguarding its own essentials and those things necessary for its existence, could frame trade policies, not for the benefit of one particular country or another, but for the benefit of all members of the British Commonwealth. The prosperity of one country depended so much upon the prosperity of others, and the great objective that we should try to attain was the prosperity of the whole.

For an island like ours, which depended upon overseas trade, cheap and efficient transport was a great necessity, and in this respect England was peculiarly well placed. Our ports were well situated as regarded our staple products. We had excellent railway systems, and we alone, almost in the whole world, welcomed the shipping of the world to our shores without any hindrance and without flag discrimination, so that the traders of Great Britain had not only at their disposal our own magnificent commercial fleet but the ocean going tonnage of the whole world.

The Value of the Shipping and Forwarding Agent.

We should not get the full advantages from the liners carrying traffic from port to port unless we had an efficient system for the collection and distribution of goods, and that lay in the hands of the Shipping and Forwarding Agents. Perhaps there was no body of people in the world who knew more about overseas trade or was more intimately connected with it than the shipping and forwarding agents, who were in a position, he would not say to dictate to the shipping companies, but certainly to give them very sound advice, and to put them on the right lines, and he thought it was in the interests of shipping that a strong and influential association such as the London Shipping and Forwarding Agents' Conference should exist and be in a position to deal fairly and squarely with the various shipping conferences, and to be able to give them a right idea of what their customers required and the best way of satisfying those requirements. Really the overseas trade of Great Britain largely rested in the hands of the shipping and forwarding agents. It was a very great responsibility and a very great trust, yet those who had watched what the London Conference had done in the past, and what it was now doing, were confident that they would not betray that trust. (Applause.)

SIR EDWARD CROWE, C.M.G.

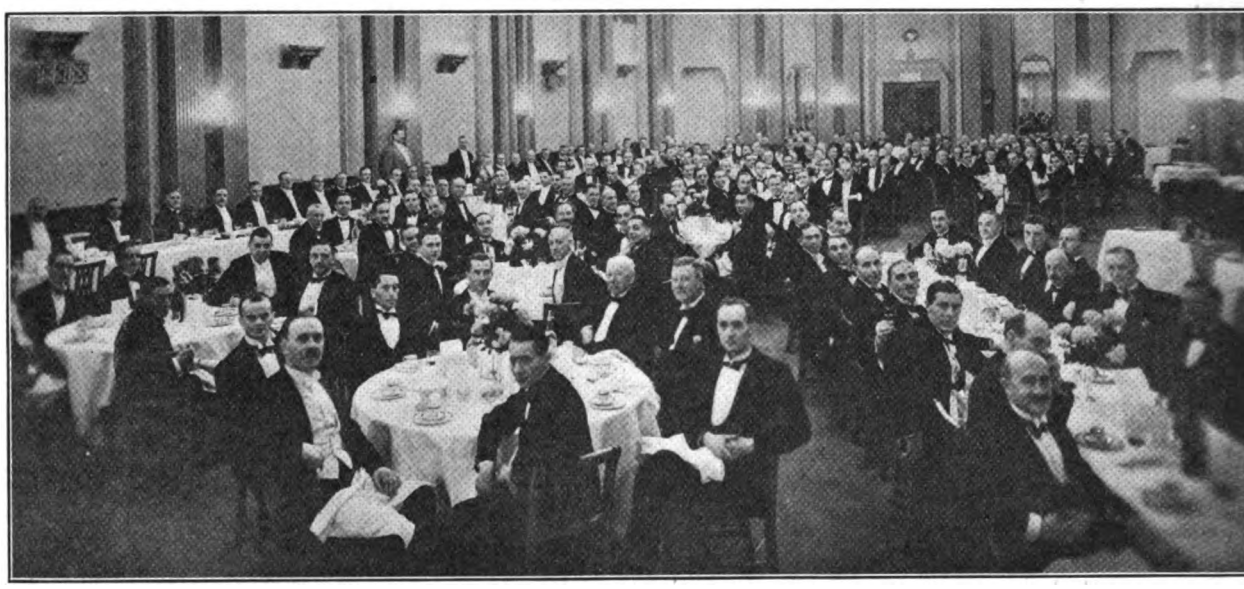
Sir Edward Crowe, C.M.G., Comptroller General of the Department of Overseas Trade, responding, said he was very glad to hear Sir Geoffrey Clarke say that the fate of our overseas trade was in the hands of the shipping and forwarding agents, and he handed it over to them with the greatest pleasure (laughter) because, as Mr. J. H. Thomas had said many times since his return from Canada, and since he took over the extremely difficult appointment of Minister of Employment, our overseas

Digitized by Google

trade was one of the most important questions before the country to-day.

Overseas trade was the method by which we could, perhaps, counter the dreadful problem of unemployment, and Sir Geoffrey Clarke was right when he said to the shipping and forwarding agents that they had a great deal to do with the prosperity of that trade.

He was told by competent authorities that many of our difficulties were caused by the fact that we did not always deliver our goods abroad in exactly the way the customer required. Of course we had been the greatest trading nation for a century, and what we did not know about trade was perhaps not worth knowing, but there were a few trades our competitors had got hold of by sometimes delivering goods in a way more acceptable to the customer than the way in which we had delivered them, and he wondered whether, in such cases, the shipping and forwarding agents, who dealt with shipping problems could sometimes put our manufacturers and merchants wise to the mistakes they were making. It was not impossible, of course, that the manufacturer and the merchant would turn to them and say "mind your own business, I am sending my goods through you and I do not want to learn anything more," but he thought there were times when the shipping and forwarding agents might, perhaps, be of help to them.



ANNUAL DINNER OF THE LONDON SHIPPING AND FORWARDING AGENTS' CONFERENCE.
STANDING AT TOP TABLE, MR. M. E. DUFFETT, PRESIDENT OF THE CONFERENCE.

THE PROBLEM OF LATE DELIVERY.

Sir Geoffrey Clarke had mentioned the question of salesmanship, and he agreed with him that we had some of the finest salesmen in the world, but still he thought there might be something wrong here and there, and for that reason a committee was appointed by Lord Eustace Percy to consider education for salesmanship. He had been privileged to see an advance copy of the report of the Committee and he had noticed a paragraph which struck him as being of considerable interest to the shipping and forwarding agents because it dealt with a problem which was often brought to his notice, and that was the question of the late delivery of goods. Many times they were told that the consumers in foreign countries wished to place orders in this country, but had been disappointed because goods ordered on previous occasions had been delivered late. The Committee in their report said:—

> "British exporters have been frequently criticised in the past for delay in delivery of goods, or for requiring an excessive time for delivery. Though there is reason for thinking that this shortcoming has been largely remedied in some markets, there is, to judge from our evidence, still ground for criticism. The export manager, it is said by one of our witnesses, "should hold that deliveries on the promised date are as important as his prayers," and implies that many do not, while another witness, speaking of a European market of a difficult character, states that a good deal of harm has been done on occasion by British firms falling to make delivery up to time. Another says: "It is, perhaps, also worth pointing out that complaints are frequently heard that English firms are less expeditious in answering letters and enquiries and in submitting quotations than German houses." Complaints of failure to make delivery up to date, or of delay in supplying quotations or tendering for contracts, have also reached us from other sources."

He did think it was important they should see that where goods were ordered for export by a certain date that they were there on that date. He was perfectly certain that it was not the fault of the shipping and forwarding agents, who would never dream of anything going wrong with their arrangements. (Laughter.)

They must concentrate on developing our overseas trade. Many countries had put up tariffs against us because they had got to protect the industries they themselves had started, and it was difficult for us to compete in those particular countries, but why should it be difficult for us to compete with the manufacturers in, say, country "A" for markets in country "B" when there was a tariff against both countries' manufacturers?

If, in the course of their work, the shipping and forwarding agents could see any chance of pointing out where the British manufacturer, or merchant, was going wrong, or missing chances, and where they thought he could be put right, he hoped they would not hesitate to tell the Department of Overseas Trade. They should not mind even if they thought it might be a little embarrassing or a little indiscreet, but come and see him or write him a private note and say "look here, so and so is going wrong," and he would look into it and try to put things right. His job was to look after overseas trade and he would be only too glad to help in every possible way. (Applause.)

Sir Ernest Benn, Bart., proposing the toast of "The London Shipping and Forwarding Agents' Conference" said he held that the services rendered by the shipping and forwarding agents were in the centre of all we meant when we discussed social and industrial and commonwealth problems. The problem of distribution was the problem of forwarding, and the problem of selling was a vital question. It might be said that we knew all about the making of things but we had yet to learn a lot about distribution, and most of our troubles arose out of our failure to succeed in the matter of distribution.

He congratulated the members of the London Shipping and Forwarding Agents' Conference most heartily upon holding their 32nd Annual Banquet, and, whilst thinking of their glorious past and their promising future, might he suggest that they take their hats off to the past and their coats off to the future. (Applause.)

REPLY BY THE CHAIRMAN.

Mr. M. E. Duffett (President of the Conference and Vice-Chairman of the British Association of Shipping and Forwarding Agents), was received with enthusiasm when he rose to reply to the toast.

Looking back over the past year, he said, one was impressed by the good work the Conference had done. The shipping and forwarding agent had to be the guide, philosopher and friend of the shipowner, the exporter and the importer, and it was his duty to obtain the best terms and to do the best he could, and to conduct his business in a just way for the benefit of all concerned.

Digitized by Google

Although it could not be said that during the past year trade had been very flourishing; when they remembered that about one-third of the world's surface and about a quarter of its population had been, as it were, demobilised in regard to trade, this being due as they all knew to internal revolution and civil strife, it was to him amazing that the trade of this country had remained as good as it had. From the point of view of the forwarding agent, owing to the numerous world-wide ramifications of his business, fluctuations of trade were tempered by the fact that when one trade was bad another was good, and that when imports went down exports often went up, and so there remained a general average. That might, perhaps, be due to the fact that the shipping and forwarding agents were in a position to cope with extraneous business as it cropped up.

One side of the times which was very gratifying was that there was a marked change in regard to the position of the forwarding agent. For a number of years it had been distinctly noticeable that he had been more or less eliminated, but that process of attempting to eliminate him as a useless middle man appeared to be lessening considerably. That might be due to the fact that the greater technical knowledge required in these days in regard to customs, tariffs, railways, steamships, etc., was beyond the capacity of any but the competent and reliable shipping agent. There were those who were willing to admit it, whilst those who had adopted a forwarding department or a forwarding section or even a forwarding clerk, were coming to the conclusion that the unnecessary worry, trouble and endless expense entailed was such that instead of losing money by attempting to go outside their own province by doing the work which the shipping and forwarding agents were in the habit of doing, it would be wiser to adopt another method and to devote their energies to the development of their own proper business which they rightly understood.

WHAT THE SHIPPING AGENT MUST KNOW AND BE.

There were others who would tell them that the forwarding and shipping agent's business was simplicity itself, but that was not correct. They had to bear in mind that the shipping and forwarding agent had to have a knowledge of geography and a grasp of figures, together with a general knowledge of the descriptions of goods and their relative weights and measures, and he also had to know the consular requirements of every country in the world. He had to be carman, shipowner, lighterman, wharfinger, warehouseman and packer, and he had to have legal knowledge. He was a banker and moneylender, and some of their clients appeared to be under the impression that that was his rightful avocation. (Laughter.) That was only part of what he had to do because, in addition, there was insurance, settlement of claims, rates of freight by rail, air and sea, and he must be an authority on mails in regard to the delivery of documents, and unless the forwarding agent was able, at any moment, to advise his client correctly, he was not considered to be worth employing. Thus would they see how necessary it was in the interests of all concerned that only a really live and reputable forwarding and shipping agent should be employed.

A LITTLE KNOWLEDGE A DANGEROUS THING.

There was an old saying that a little knowledge was a dangerous thing, and as an instance he might tell them that a large firm wrote to the Press mentioning the terrible iniquities of H.M. Customs, and complained of serious delay in obtaining delivery of imports. He took steps to ascertain the facts and found that the delay was due entirely to lack of knowledge of Customs requirements on the part of the firm in question. Had any of those present that evening had the matter in hand he was quite sure that they could have delivered the goods within two days to the clever merchant, who would thus not only have been saved a great deal of worry and trouble, but would also have saved a great deal of time and expense. Unfortunately, in theirs as in other trades, there were black sheep, and the Conference in their own interests as well as in the interests of the public kept a watchful eye on those who adopted methods likely to bring discredit upon their profession, and by appropriate action had been able to bring to the notice of the authorities, concerns which were acting in a reprehensible way and were doing the shipping and forwarding agents a great deal of harm and damaging their reputation. It was, and must always be, their aim to raise the status of their industry and to do all possible for the protection of their members and incidentally of the public.

KINDRED ASSOCIATIONS.

Their collaboration with their contemporaries both in America and on the Continent had been very successful, and had done a great deal of good.

Politics did not enter into their activities, but the ways of politicians were of great interest to them, and they viewed with curiosity and sometimes alarm the trend of events, for a change in Customs regulations, or the imposition of a new Duty was of vital importance especially should it tend to hamper trade.

They had to be abreast of the times and keep themselves fully posted, so that they might be of assistance to their clients in the development of their businesses. Transport was a great trade, and what many people overlooked was the fact that the costs of transport were often of more importance in price making than many other factors which received greater attention. It was one of the duties of the shipping and forwarding agent to obtain the best price, not necessarily the cheapest, and to send goods by the most suitable route, and knowing as they did all routes they often did much to alleviate and solve difficulties and so helped to promote trade. There must be full co-operation between industry and transport if they were to increase exports, and he would remind them of the assistance they had received in various ways from the Railway Companies and Customs and Port Authorities which had made the forwarding agent's calling very much easier, and his hearers would agree that the closer their acquaintanceship with the shipping companies, railway companies and others, and the more friendly their relations the smoother would be the working of the various phases of transport which was so essential to the development of this country. The trade of the Port of London was maintained, and the record during this year, so he was informed, was even better than anticipated. There was, however, one matter which still remained to be carefully considered and that was the question of charges. London was not a very difficult Port, and to enable our manufacturers successfully to compete with some of the Continental Ports it was very necessary that the costs of delivery from the docks putting on export steamers and taking off import steamers, should be reduced, but before that could be done a great deal would have to be accomplished to improve the approaches to the docks because congestion there was the cause of much unnecessary expense which ought to be avoided.

He would like to see members take a more lively interest in the meetings of the Conference and in the many matters dealt with which were common to all of them. They had a most energetic Council which did a great deal of hard work holding last year no less than 45 meetings. The Council was ready to tackle any question, but would be much happier if a more lively interest was taken by the individual member, particularly in the meetings of the different sections.

PROPOSED STAFF PENSION FUND.

There was one other matter he would like to touch upon and that was the question of establishing a staff pension fund. Such schemes had been adopted by many other trades, and he would like the members to consider whether the time had not come when something similar should be done by the shipping and forwarding agents' members of the Conference. There existed already individual schemes of a contributory character for the payment of a pension at a certain age or alternatively at death, but he thought that better terms could, perhaps, be obtained by them as a body than if the matter was approached by the individual member. He would like the members to think over the matter and to communicate their views to the Secretary, because he did feel that there was something in the scheme which would be not only good for themselves as companies and firms, but also a very good thing from the point of view of their staffs. (Applause.)

Mr. E. W. Turvey, proposing the toast of "Our Guests," said that a shipping and forwarding agent must be versatile, and it seemed to him that the only thing he was not yet expected to undertake were the duties of an announcer at the B.B.C. (Laughter.)

He assured all the visitors that the London Shipping and Forwarding Agents' Conference did appreciate their presence that night.

The toast was to be responded to by Mr. A. W. Heard, the excellent Chairman of the British Association of Shipping and Forwarding Agents. They were looking to Mr. Heard to lead them towards a happier state of affairs than had existed in the past, and to point out to them the road they should pursue in the future. They looked to him also to raise the position of the Shipping and Forwarding Agent to a higher plane. They extended to Mr. Heard the hand of friendship and wished him jolly good luck in his office of Chairman of the British Association of Shipping and Forwarding Agents. (Applause.)

It was his pleasure, also, to couple with the toast the name of Mr. E. W. Willis, the Editor of *The World's Carriers and Carrying Trades' Review*. Mr. Willis was a very good friend to every shipping and forwarding agent. (Applause.)

Digitized by Google

Mr. A. W. Heard (Chairman, British Association of Shipping and Forwarding Agents), replying on behalf of the visitors, thanked sincerely the London Shipping and Forwarding Agents' Conference for their hospitality. He complimented Mr. M. E. Duffett upon the inspiring address he had delivered, and said that if the forwarding agents followed Mr. Duffett's able lead he was sure they would come out right in the end. Personally, he would do all he possibly could to enhance the status of the forwarding agents. The experience gained by the London Shipping and Forwarding Agents' Conference was invaluable. They all hoped that the British Association of Shipping and Forwarding Agents would draw all existing Shipping and Forwarding Agents Associations and the members of the industry together, and unite their forces for the benefit of the shipping and forwarding agents all over the country. If they pulled together he felt sure they could impress upon all that they were people to be reckoned with, and that their advice, experience and assistance really were of much value. (Applause.)

Mr. E. W. Willis, Editor of *The World's Carriers and Carrying Trades' Review,* said he esteemed it a great honour to be asked to respond, with Mr. Heard, to the toast of the guests. He recalled that it had been his privilege and pleasure to endeavour to help forward the interests of the London Shipping and Forwarding Agents' Conference ever since the year 1904-5, and that it was in 1905 that their very popular President, Mr. M. E. Duffett, was elected Hon. Secretary of the Conference. He joined with Mr. Heard in wishing the London Conference all prosperity. (Applause.)

Port of London Authority.

OPENING the Port of London Authority Staff Arts and Crafts Exhibition recently, Mr. D. J. Owen, the General Manager, said it was gratifying to find such artistic talent among the staff of the Port of London Authority, and he thought it went to prove that they were not all gross materialists, and in that respect were better able to serve the Authority and thus the community which the Authority was constituted to serve. It was gratifying to think that the Port Authority had performed its duty in an exceptional manner, and he knew of no other public institution which exceeded it in the way in which it served the community.

* * * *

Concurrently with the steady increase in the tonnage of shipping using the docks of the Port of London, there has been an increased demand for facilities at public moorings in the river for vessels requiring to discharge or load part cargoes. The Port of London Authority have, therefore, decided, subject to local conditions as regards dredging operations, etc., to increase the capacity of certain of the public moorings at Greenwich, Charlton and Woolwich. In addition, new mooring berths are proposed in Woolwich Reach and at Swanscombe.

* * * *

A new floating pneumatic grain elevator shortly to be delivered to the Port of London Authority, is to be named the "Thomas Wiles," after the Rt. Hon. Thomas Wiles, P.C., a Member of the Port of London Authority who is closely associated with the grain and flour trade of the Port.

* * * *

The Port of London shipping figures are up 2,000,000 tons for the seven months ended 30th October, compared with the same period last year. The 34,793,215 net reg. tons of shipping which used the Port during the period in question, is a record in the history of the Port. Additional tonnage in vessels arriving from India, China, British West Indies, Guiana, British Honduras, United States, South America, Baltic and North European Ports, accounts for the increase. In view of the publicity given to the ship repairing activities of some of the Continental Ports, it is gratifying to be able to record a substantial increase in the use of the Port of London Authority's dry docks during recent months. Exports passing over the Authority's quays during the seven months ended October, show an increase of nearly 7 per cent., the figures being the best for any similar period since 1920.

* * * *

The Port of London Authority have decided, in the interests of London's Port and trade generally, to take part in the International, Colonial and Maritime Exhibition, to be held at Antwerp from April to October next year.

The Port of London Authority have recently instituted their own enquiries throughout Canada in regard to the opportunities of developing trade between Canada and the Port of London, and in view of the growing interest throughout commercial and industrial circles, the following extracts from a letter addressed by Mr. F. Maclure Sclanders, Saint John Board of Trade, New Brunswick, Canada, to Mr. A. E. Wildey, Publicity Officer, P.L.A., provides food for thought, and, it is to be hoped, action.—"So far as the great Port of London is concerned, people on this side probably know less of it than they do of Glasgow and Liverpool. Perhaps we do not have enough sailings to and from here and London. Perhaps the shipping interests of London have not fully awakened to the importance—the ever-growing importance—of Canada's ocean traffic. At any rate, according to my own experience, I would say that the impression is correct that too little is known of the Port of London on this side. . . . Particularly during the past few years, leading ports through the world seem to have awakened in a very thorough sense to the value of good publicity. But, in my respectful opinion, such publicity must be followed up by the personal touch, which, in turn, must involve some practical proposition attractive to the other fellow. I would say that the Port of London might find it profitable to have a throroughly experienced representative spend six months on this side, meeting the right people and getting his finger closely upon the pulse of the whole situation. There has been far too little of this personal touch between the Old Country and Canada. . . . When your merchants or manufacturers send their representatives here, they rarely send the right type of man who can impress the right people. Mostly, it would seem as though the instructions received by such representatives were to cover the country in two or three weeks at the most, and to do it just as economically as it could possibly be done. That sort of thing will not do. No man can hopefully cover a country almost as big as Europe—especially a sparsely populated country, with long distances between its populous centres—and to do it properly in a week or two, and without spending pretty generously. However, at the most, the visits of such representatives are like those of angels—few and far between. If Great Britain had paid as little attention to her other less important foreign markets as she has done in the case of Canada, she certainly would not have been the Great Britain that we know to-day. If your people want this market, they must go after it; and they must be prepared to pay the price. Such a price would prove a wonderful investment—and the present moment is probably more propitious than any in the past."

Future of Canals.

MR. HERBERT MORRISON (Minister of Transport), made an important reference to canals during the debate on national transport facilities in the House of Commons.

Railways, road transport and canals, he said, and to some extent coastwise shipping, were competing and conflicting with each other while the total cost of transport was correspondingly increased. "The policy of the Government," he declared, "is to promote the co-ordination of transport undertakings, always providing that that co-ordination is in the public interest, and is not going to place the community at the mercy of a private monopoly set up by statute or authorised by statute."

Mr. R. Fane de Salis, the President of the Canal Association, points out that canals suffer under great disabilities. Thirty-three companies, including four railway companies, he stated, own 2,475 miles, the remainder consisting of navigable rivers and drainage areas, being chiefly controlled by fifty-one public bodies. The Royal Commission of 1906 came to the conclusion that the first essential to progress was unification of ownership.

The first step in this direction was taken last year by the amalgamation of the Regent's, Grand Junction, Warwick and Napton, and Warwick and Birmingham Canals, which are now owned and controlled by the Grand Union Canal Company.

* * * *

THE Government's readiness to support schemes for the development of canals was shown in a reply made by Mr. Herbert Morrison, Minister of Transport, to a question in the House of Commons, on 27th November. Mr. Geoffrey Mander, M.P., Wolverhampton, E., asked:—"Whether the Government will give support to the efforts being made by the canal owners of this country to amalgamate and rationalise their industry on a national basis, and render it independent of other interests." Mr. Morrison replied:—"It is my desire to encourage all schemes for the economic development of canals and other transport undertakings."

Van Oppen & Co., Ltd.

On Friday, 29th November, 1929, Van Oppen & Co., Ltd., international transport, shipping, insurance and freight brokers, established 1879, whose head offices are at 90 & 91, Bartholomew Close, London, E.C.1, celebrated their 50th anniversary. It was a proud day for Mr. W. Van Oppen, the founder of the firm, and still the managing director. The occasion was marked by the presentation to him of a handsome Old English silver rosewater bowl by the staffs of Van Oppen & Co., Ltd., Van Oppen & Co. (Holland), Ltd., Societe de Transports Van Oppen, Ltd. (France), and Van Oppen & Co. (Inc.), New York. The bowl, which was made by Mr. Omar Ramsden, bears the inscription: "I was wrought for William Van Oppen in the year of our Lord MCMXXIX by command of his staff to mark the fiftieth anniversary of his founding of the House of Van Oppen." Mr. Van Oppen was also presented with an illuminated address from the staffs of the said companies, and with a silver rose bowl by Mr. A. F. J. Brown, secretary and director, who has been associated with Mr. Van Oppen's activities for forty years. Telegrams of congratulation were received from the staffs in the U.S.A., France, Holland, and the various offices of the Company in the United Kingdom.

MR. W. VAN OPPEN.

The firm of Van Oppen & Co., Ltd., was established in London on 1st December, 1879, and branches now exist in the principal ports and commercial centres of the United Kingdom, and other companies have been formed to transact business in Holland, France and the U.S.A. These various associations comprise nearly a score of offices, and the name of Van Oppen has become known all over the world in connection with the transport of goods, for the business is a general one and is not confined to any particular class of goods or to any particular country. Groupage services are maintained to and from all the principal Continental centres, and equally important business is done with the British Dominions overseas and, in fact, with all parts of the world. The firm are also experts in the shipment of livestock and household removals, and were selected as the official carrying agents to the Exhibition of Dutch Art, recently held in London at the Royal Academy, and to many other Exhibitions, including that of Retrospective British Art just held in Brussels.

Port of Gloucester. — Some of the special features claimed for the Port of Gloucester are, quick despatch and moderate rates; all modern facilities for traffic; direct water, rail and road connection between ocean steamer and consuming districts, without intermediate transhipment; cheapest rates for transport from docks to Midlands. The Port of Gloucester is situated on the estuary of the River Severn, the ocean dock at Sharpness being connected with the Gloucester Docks by a Ship Canal. The Sharpness Docks provide accommodation for vessels up to 9,000 tons carrying capacity, and, by means of the canal, vessels up to 1,200 tons capacity navigate to Gloucester. Any information regarding facilities at the Port may be obtained upon application to Mr. E. Manning Lewis, M.Inst.T., General Manager and Secretary. Sharpness New Docks, and Gloucester and Birmingham Navigation Company, Port of Gloucester, Dock Office, Gloucester.

New Thames Motor Tug.

RECENTLY we had an opportunity of inspecting the new tug "President," owned by Messrs. G. J. Palmer & Sons, of 10 High Street, Poplar. The "President" is the first full diesel multi-cylinder engined tug appearing on the River Thames and is to take regular work of towing up Bow Creek to the River Lea and up to Kingston-on-Thames.

The engine is a new type known as cold starting full diesel. Previously, only semi-diesel engines have been used in motor vessels and tugs, these being commonly known as hot bulb engines, in which the cylinder head has to be previously heated by blow lamps to enable the fuel to explode. This new type engine, using common fuel oil, relies for ignition of the fuel upon the heat generated by compression of air in the cylinder.

It is only of late years that semi-diesel engines have been used in tugs, and this new full diesel engined tug marks a new era in tug engines. No coal whatever is used as in steam driven tugs. Fuelling takes only about thirty minutes for fourteen days supply.

This new engine does not need an open flame of external heat of any kind, the whole engine being only of moderate temperature when running full load.

G. J. PALMER & SONS' TUG "PRESIDENT."

Since their first semi-diesel engined tug, the "Pioneer," was introduced to the Thames, a number of tug owners mostly using steam have adopted this type of engine, and the firm predict that it is only a matter of time before the steam engine will be obsolete, giving way to full diesel engines.

Whilst being an old established firm in London, Messrs. G. J. Palmer & Sons, have built up their towing business relying on new engines of modern type to keep abreast of competition, these being able to operate more economically than steam engines. This is why they have put this new engined tug on the river for towing, as they believe that the best machinery is necessary if they are to compete successfully.

The engine is a British production, and the makers are Messrs. Norris, Henty & Gardners, Ltd., of Patricroft.

When the "President" made her first run under load, the tug ran from London to Kingston towing four heavily loaded barges in good time.

Port of Bristol. — The Port of Bristol has a history extending back over two thousand years. This western gateway of England is the market and distributing centre for grain, provisions and other goods for the West of England, and the Port, under the enterprising management of the City Authorities, has developed other important departments of industry, and no effort has been spared to render its equipment so complete and efficient as to meet every modern requirement. The Authority publish monthly an official guide and list of sailings, copies of which, price 2d., may be obtained upon application to the Commercial Manager, Port of Bristol Authority, Queen Square, Bristol.

Ports of the London and North Eastern Railway.—The London and North Eastern Railway Company's docks and harbours form a magnificent chain of modern ports, extending from Harwich, in the South, to the Tay in the north, and include such historical and world-famous ocean gateways as the Humber, the Tees, the Tyne, and the Firth of Forth on the East, and Silloth on the West. Sailings from the Company's ports are regular and frequent, dock charges are low, and compare favourably with other seaboards. Particulars of facilities, rates and charges will be gladly supplied on application to the Goods Manager, L.N.E.R. (Southern Area), Hamilton House, 155 Bishopsgate, London, E.C.2.

Liverpool Shipping and Forwarding Agents' Association.

29th Annual General Meeting.

THE 29th Annual General Meeting of the Liverpool Shipping and Forwarding Agents' Association, and the 9th of the Incorporated Association, was held at the Exchange Hotel, Liverpool, on Wednesday, 20th November.

Mr. G. C. Horton presided, and amongst those present were :—

Messrs. Thos. T. Inglis and David Inglis (David Inglis and Co.); R. E. Corkhill (C. Shaw Lovell and Sons, Ltd.); Thos. L. S. Dooly (W. W. Jones, Dooly and Co., Ltd.); Arthur H. Clint (R. Steinmann and Co.); D. G. Boyd (Elder Dempster and Co., Ltd.); Chas. G. O'Donnell (Browne, Geveke and Co.); J. Flounders (Donaldson Bros., Ltd.); D. J. Hughes (The Transport and Export Co., Ltd.); J. Mitchell Jones (Andrews Gillespie and Co.); John Walton (James Hewitt and Co., Ltd.); J. H. Hughes (Maccabe, Hughes and Alexander, Ltd.); W. R. Lloyd (W. R. Lloyd and Co.); J. A. Eckes (Langstaff Erembert and Co.); A. F. Bower (F. Bower and Co.); F. Goodwin (Thos. Cook and Son, Ltd.); C. A. Brameld (G. A. Woodcock, Ltd.); C. Stockwell (Stockwell and Co., Ltd.); J. R. Grant (Escombe McGrath and Co.); W. W. Hodgkins (Du Temple and Co.); J. E. Brown (H. and W. Nelson, Ltd.); Fred. J. Adams (Wm. Roberts and Co.); J. Hilmar Jones (Rogers and Bright, Ltd.).

Apologies for non-attendance were received from the President (Mr. David Jones), Messrs. J. Jude, C.C., C. V. Berrin and C. E. Turner.

In moving the adoption of the report and accounts, the Chairman said, "the Association was steadily advancing. The membership was keeping up to the standard, and finances were also very satisfactory.

"The Association is well represented at the Chamber of Commerce Committees, etc., and through the local chamber, at the Federation of British Chambers of Commerce. I would like to urge all our members who are not already members of the Chamber of Commerce to become members, as I believe the influence of the international chambers must have a very useful and beneficial influence, towards eventually removing many of the barriers which to-day impede the free flowing of commerce between the various countries, and finally help towards the promotion of a commercial league of nations.

"The Council is also working in complete harmony with other forwarding agents' associations, including that of New York. A member of our Council has just been re-elected to the Liverpool City Council.

"It is very pleasing and encouraging to learn from the Annual Report of the Mersey Docks and Harbour Board, just published, that Liverpool retains her proud position as the chief exporting port of the British Isles. As forwarding agents, this is particularly gratifying to us, as undoubtedly our efforts, canvassing, etc., must have no little influence on the exports passing through Liverpool. We occasionally criticise the control, not the controllers, of the port; but such criticism is only prompted by a sincere desire to increase the standing and success of the port and to remove grounds for stronger comments from other sources. It will be only just to express the Association's appreciation of the, at all times, willing co-operation of the Mersey Docks and Harbour Board and its various officials; likewise that of the steamship companies, etc. We know the propositions which we place before them do receive considered and sympathetic attention, and that when such proposition cannot be accepted, then there are real reasons for the non-acceptance.

"We have still our long-standing grievance—we want a direct representative of the Liverpool Shipping and Forwarding Agents' Association elected to the Mersey Docks and Harbour Board, in keeping with the privilege granted to other trade associations of the port. We have many friends on the Board, but that is not quite the same as having our own nominee. We should like to see the Board more representative of the various interests so deeply concerned in the success of the port; but this must not be considered in any way advocating control by the City Council; just the reverse. Our Association, however, whilst very keen on increasing the volume of traffic passing through the port of Liverpool, cannot be content to obtain that end, simply by taking away trade from the other British ports. We want to see a general increase in the trade of the British Isles and to share proportionately in such increase. Many solutions are being proferred for the improvement of trade in general, as it cannot be denied that we are not participating to our rightful extent in the world's commerce, which, I think, now shows signs of a gradual and general development.

"One of the chief factors in securing and retaining foreign trade, which in my opinion must prove to be the real salvation of Great Britain, is ability to quote equal prices, terms, etc., as our foreign competitors. Before this necessary end can be achieved, our national and local expenditure and other calls upon commerce must be decreased. I am confident that our greatest handicap in securing foreign orders is the high selling prices necessary to satisfy the demands for rates, taxes, rents, etc., which are out of proportion to those demanded from our principal competitors. We have the brains, the intiative, the reputation, and, I think, the enthusiasm; but these are overweighted by heavy overhead charges, particularly local rates. This doctrine of national and local economy has been advanced on many occasions, but unfortunately without apparent results; in fact the tendency to-day appears to be towards increases rather than decreases.

"The Derating Bill may prove an effort in the right direction; even though it has resulted in many of us having to pay increased rates. The remuneration from sheltered professions is not quite in line with that from unsheltered or competitive professions. Were it not for the deplorable number of unemployed, it might be difficult to emphasise with success the poor state of the trade of the country. The display of apparent wealth and luxury was never so evident as it is to-day. The amounts invested in war loan, saving certificates, post office saving banks, etc., seem to be creating record after record. Perhaps the explanation is not unconnected with the remuneration from sheltered professions, which, if I may say so without offence, is dependent to a large extent on the unsheltered or competitive professions. Public services are costing far too much. Another serious drawback to home and foreign trade is the high rate demanded for borrowed money. This must be a very serious item for such bodies as the Corporation and the Mersey Docks and Harbour Board. The return to pre-war conditions in this respect would have an enormous influence on the financial welfare of the country, etc. I have already stated that we have the brains and initiative, but it is essential that these be properly applied.

"The world's commerce is continually changing, and must be on the changed conditions that the British manufacturer, etc., concentrates with keenness and thoroughness. Old methods will not secure new business. The progress of the British motor car and artificial silk industries is a striking example that we, as a nation, can be alive to the possibilities of the comparatively new industries. Commercial aviation, pulverised coal fuel, may also prove welcome new sources of employment and revenue. Whilst I am against 'state aid' as a general principle, preferring 'self help,' I recognise that with the present abnormal conditions, the Government might seriously consider whether it could help the advancement of new industries, which might lessen the army of unemployed, and eventually prove real assets to the nation.

"Another suggested source of increased trade is the extension of the hours for shopping. It is claimed that whilst there is little limit to the hours amusement can be purchased, there is a very rigid limit to the time when the more essential things can be obtained; therefore money which might be spent on the latter, now goes to the former, which is less productive.

"It may be unwise to venture suggestions as to what are the prospects for the future, but it will be agreed that during the past year, the ground has been prepared for progress towards international peace with all its accruing advantages to international commerce, etc. This spirit of desire for international peace is helping towards British industrial peace. Employer and employee are recognising co-operation produces much better mutual results than 'pulling against each other'; that capital and labour have both principal parts to play in industry. A spirit of optimism seems now to be quite justified, and a walk down the principal shipping street in Liverpool, cannot but awaken this spirit and prove that the leading lights in shipping and banking, etc., have faith in the increasing prosperity and future of the port of Liverpool.

"Whilst Liverpool may not be exactly booming, we are justified in our faith in the future of the port, and this faith should engender greater enthusiasm in our rendering every assistance towards its further development. If not out of place, the pleasure of the Association might be expressed at the acceptance by so eminent a shipowner of the Lord Mayoralty of our city, and our congratulation and wishes for a happy and successful year of office be sent to Mr. Lawrence D. Holt. In conclusion, I have to express my thanks for the co-operation of our Council, who devote a considerable amount of time to the interests of our Association, and to emphasise

Digitized by Google

the valuable assistance we receive from our secretary, Mr. S. L. Jude."

The Vice-Chairman, Mr. W. R. Lloyd, seconded the resolution for the adoption of the accounts, which was carried unanimously.

The Secretary, Mr. S. L. Jude, announced that no members of the Council retired this year, and as no nominations had been received for the one vacancy, there would be no election.

The President, Chairman and Vice-Chairman, were accorded a vote of thanks on the proposition of Mr. Hughes, seconded by Mr. Flounders.

Short discussions followed on various matters of interest to shipping and forwarding agents. Mr. Bower referred to the monthly circulars that were issued by the Association summarising the activities of the Council. It struck him that if the information given, was supplemented or dealt with at greater length, the circulars would be of more value to members. One item in a circular mentioned receipt of a notification of certain revised rates. Probably most of the members of the Association knew what those rates were, but possibly there were others who did not. He thought, therefore, that where possible, fuller information should be given.

The Chairman said it was the desire of the Council that the circulars should be as informative as possible, but various considerations could not be overlooked. He hoped the Council would find it possible to increase the size of the circular, if necessary.

Another shipping and forwarding agent mentioned the fact that the Dock Board, at one time, used to send out notices informing shipping and forwarding agents that their goods were due off the quay on a certain date. To-day, however, in many instances, the agent could not get his consignments from the quays without incurring watching charges, due entirely to the absence of any notification. Could not the Association take the matter up with the Dock Board.

The Chairman replied that it was purely an act of grace on the part of the steamship companies to send out notices. The matter would, however, be taken up by the Council.

News from the Ports.

Merseyside Area.

Liverpool Shipping and Fordwarding Agents' Association.—The annual dinner of the Liverpool Shipping and Forwarding Agents' Association, whose annual general meeting is reported on another page, will be held on Saturday, 18th January, 1930, at the Midland Adelphi Hotel, Liverpool.

14,422,000 Tons of Goods.—From the Mersey Docks and Harbour Board we have received a copy of the annual acounts for the period ended 1st July, 1929, together with the statement of the chairman, Mr. Richard D. Holt, who makes a review of the works undertaken during the year. The revenue from ships shows an increase of £135,000 over that of last year, mainly due to the reduction in the harbour rates and to the increase in the foreign dock tonnage and wharf rates. The rates and dues on goods foreign inwards show an increase of £15,000 and on goods foreign outwards an increase of £6,000, but there was a loss of nearly £12,000 on coastwise dues, resulting from the remission of dues outwards coastwise made on the 1st April last in anticipation of the derating relief. The tonnage of vessels paying dock tonnage rates was 15,553,104 tons, an increase of 306,983 tons on the previous year and only 341,303 tons less than the figure for 1927 which was artificially swollen by the coal stoppage. The estimated weight of goods on which dues were paid was 14,422,000 tons, as against 13,970,000 tons in 1928, an increase of 3 per cent. approximately. "Considering that we are living in a time when trade is not enjoying exceptional prosperity and finance is not particularly easy," says Mr. Holt, "the record of our port for the year, both in trade and finance, seems to be by no means unsatisfactory, and to afford no ground of encouragement for those who are so fond of lamenting the decay of the port of Liverpool. And I fear that these gentlemen will not get much comfort in the near future, for I am glad to be able to state that there has been a very marked improvement in our trade since the beginning of August."

De-rating Benefits.—In consequence of the Government's de-rating scheme, the Mersey Docks and Harbour Board has decided to reduce the charges for railway haulage between the dock estate and the Liverpool railway stations by 33 1/3 per cent. Thus a benefit will accrue to all classes of goods dealt with under the haulage system, both inwards and outwards. From January 1st, inclusive, the dock tonnage rates and wharf rates on the various classes of foreign-going vessels will be reduced by five per cent. In anticipation of the benefits to be received under the de-rating scheme all goods exported coastwise were exempted from outwards town dues as from April 1st last. Dock rates and town dues have also been reduced. Motor cars and motor wagons for export have been put on a tonnage basis, at the request of the trade, and the reduction in the outward rate is equivalent to 50 per cent.

Lower Dock Rates.—Mersey Docks and Harbour Board have directed that, as from the 1st January next, a reduction of five per cent. be made in the dock tonnage rates and wharf rates on ships as regards the rates applicable to Voyage Classes Nos. 4, 5, 6 and 7 shall operate.

Dry Goods Primage Rate.—Notice has been given to shippers by the Cunard Steamship Co., Ltd., and the White Star Line, of the discontinuation of the primage of 10% which has hitherto been charged from Liverpool by these two companies on the dry goods rate. The net tonnage rate is now applied on shipments.

Manchester Area.

Manchester Conference.—One of the principal questions discussed at the monthly meeting of the Manchester Shipping and Forwarding Agents' Conference, held on 14th November (Mr. H. P. Lumb presiding), was the competition of East Coast ports where no charge is made for the clearance of non-dutiable goods. After a thorough discussion, the meeting decided to support the British Association of Shipping and Forwarding Agents, which is conducting negotiations with the Humber Conference with a view to amicably settling the question. Another topic to which attention was given was the issue of through bills of lading to interior towns in the United Kingdom. Correspondence on this point has been exchanged with the London Shipping and Forwarding Agents' Conference and the North Atlantic U.K. Conference at New York.

Ship Canal Traffic.—The Manchester Ship Canal Company has forwarded us a summary of traffic receipts for the month of October, the approximate figure being £110,872, which is only £658 less than October, 1928. The total receipts for the first ten months of this year were £1,190,680, as against £1,170,492 for the corresponding period of last year, and £1,225,812 in 1927. Almost throughout the year there has been a tendency towards heavier ship canal traffic, and it is expected this will continue until the year is out. The Ship Canal Company has passed on to the users of the Canal the benefits of the de-rating proposals. The traffic receipts reported will not be increased by the Government's contributions as these will be paid direct to the rating authority, but the expenditure side of the company's accounts will get the benefit of substantial relief.

Bombay Shipments.—In respect of shipments sent forward from towns other than Manchester, the Bombay Outward Freight Conference has revised the allowance of 7s. 9d. per ton and substituted therefore 7s. per ton measurement (exporters to pay all the other charges, including Liverpool dock and town dues). This allowance is intended to be the equivalent of the carriage from the Manchester warehouse to alongside the steamer.

Consular Note.—The Manchester branch office of the German Consulate (Liverpool) is now in charge of Mr. Muller Heymer, of 8, Kinnaird Road, Withington, Manchester.

Consular Fees.—Shipping and forwarding agents should note that in future any commercial invoices presented to the Turkish Consulate, Liverpool, must show the value of the packing as a separate item; that is to say, the value of the goods must be shown, plus the value of the packing, making a total upon which, in future, the consulate fee will be assessed. Similar details must, of course, also appear on the Certificate of Origin. This is a slight variation, because hitherto the fee has been leviable upon the value of the goods only. There is only one exception when the fee will not be levied upon the value of the packing also, and that is when full containers are emptied and either returned to their place of origin, or sent to other countries before the original packages and their contents enter the Customs zone. In such case Consular fees will not be payable on the value of such containers, nor Customs Duty assessed on such containers, provided that the Certificate of Origin also bears the clause "Cases to be subjected to transit no Tax perceived."

Tyne and Tees Area.

Tyne's Great Future?—Sir William J. Noble, Bt., was re-elected to the chairmanship of the Tyne Improvement Commission for the fifth year at the last meeting of that body. Definite proposals from the L.N.E.R. for the development of Jarrow Slake were, he said, hoped for shortly. One of the things to be done in that connection would be the dredging of the Tyne from Shields Bar to the Slake, where the scheme provided for 35 feet of water at low tide. When that was done, the Tyne would be in the forefront of British maritime rivers, and would have a depth of water equal to that at Southampton.

Trade on Upward Grade.—Coal shipped from the Tyne this year up to November 18th totalled 17,400,000 tons, or an increase over 1928 of 3,250,000 tons. It is hoped to reach 20,000,000 tons by the end of the year. The new deep-water quay at the Albert Edward Dock, North Shields, has far exceeded expectations. The Tyne Commission based its calculations on 20,000 tons of merchandise and 100,000 tons of coal, whereas to the end of June the actual quantity of merchandise was 48,000 tons, and 98,000 tons of coal was shipped. In addition to the Norwegian passenger vessels, 64 other ships used the quay.

Week-End Loadings.—By the week-end loading of ships, under the arrangement made with the trimmers and other workers, states Sir William J. Noble, Bt., chairman of the Tyne Improvement Commission, in 11 months no fewer than 919 vessels were loaded in that river which might otherwise have been detained over the week-end. These vessels, which might have been detained in port or not have come to the river at all, carried 2,500,000 tons of coal.

A Worthy Veteran.—Mr. John H. Amos, general manager of the Tees Conservancy Commission, must be congratulated cordially on having attained 42 years' service with that body. A native of Newcastle, he became secretary in 1887, after a few years' service as the manager of Newcastle Corporation Quayside estate. He has played a prominent part in the development of the Tees, and is optimistic as to the future both of the river and of the industries on its banks. It is noteworthy that the whole of the land reclaimed has been disposed of, while the Commissioners are widening and deepening the river consistently.

Safety at Sea.—"The Romance of British Shipping" was the subject of a most interesting address given to Newcastle Rotary Club by Rotarian W. T. Todd, secretary of the North of England Steamship Owners' Association. He sketched vividly the growth of Britain's mercantile marine, tracing the change from sail to steam, and dealt lightly yet caustically with the legal enactments with which the shipping industry is hedged around. Cordial thanks were accorded to the speaker on the motion of Mr. Rd. Aughton (general manager of the Tyne Improvement Commission), who mentioned that 20 millions of registered tonnage went in and out of the Tyne in a year, and that 19 to 20 million tons of coal would probably be exported from that river in 1929.

Extending Newcastle Quay.—There is a movement afoot for the extension of Newcastle Quay at a cost of £200,000 or more, and Government aid is being sought. The desire is to accommodate the finest type of Atlantic cargo liners so that goods could be brought to Newcastle direct instead of it being necessary for merchants to pay freight from Liverpool, Glasgow, Hull and other ports.

History of the Port of Blyth.—An interesting and instructive book on "The History and Development of the Port of Blyth" has been written by Mr. C. E. Baldwin, general manager and secretary of Blyth Harbour Commission. The author refers to the old-time salt industry, and then to the important part since played by coal in the development of the river. "With regard to the future," says Mr. Baldwin, "it is difficult to venture any prophecy. So far as an opinion can be expressed, it might be said that the geographical position of the harbour is such that there cannot hope to be any very material advancement in general trade, but as the harbour has always been a coal port it is hoped that the additional appliances and accommodation will enable it to maintain its position."

Winter-Time Trading.—Messrs. Watts, Watts & Co., shipowners, of Newcastle, Blyth and London, are to manage the operations of light ocean-going freight carriers of the Dominion Steamship Line, a Canadian company. During the summer months these trade in the St. Lawrence, but when that river closes for the winter they will be employed in European waters. Messrs. Watts, who commenced business in Blyth, own the British Steamship Line, composed of 36 vessels.

Tees Model Finds Home.—The huge scale model of the River Tees, which interested many visitors to the North-East Coast Exhibition at Newcastle, is to find a permanent home in the Dorman Memorial Museum at Middlesbrough.

Clyde and Forth Area.

Clyde Shipbuilding.—November was an exceptionally poor month for the shipyards, only nine vessels being launched, aggregating 18,000 tons. Three of the vessels were for cargo traffic, the largest being a 5,000 tonner built by Lithgows of Port Glasgow. For this month the contracts placed include two cargo steamers for James Nourse, Ltd., London, and the Hain Steamships Co., of Cardiff.

Australian Fruit.—As a result of the tour of the Antipodes made some time ago by Mr. Harold M. Ford, the secretary of the Clyde Navigation Trust, arrangements have been made for the direct shipment of fruit to Glasgow from ports in Australia and Tasmania. For some time back Mr. Ford has been negotiating for a regular itinerary, and a programme has been arranged with the Blue Funnel Line whereby five steamers are to be berthed for Glasgow next season with refrigerated space for apples. Messrs. Holt (Blue Funnel Line) will put on the following vessels:—"Nestor," "Telemon," "Asphalion," "Ulysses," and "Anchises." This successful move to have direct shipments of fruit to the Clyde may be followed by the shipment of other commodities sent to Scotland by Australian interests.

Clyde Trust Chairman.—The new chairman of the Clyde Navigation Trust is Mr. James Craig, of Messrs. R. Hunter Craig & Co., Ltd., flour and produce importers, Hope Street, Glasgow. He has been a member of the Trust for nearly thirty years and is, therefore, eminently qualified to fill the important office to which he was elected by the unanimous choice of his fellow members.

Grangemouth Docks.—Trade at the Grangemouth Docks has been moderately brisk. General cargoes have been chiefly handled, although the coal tonnage has reached a high level.

Humber Area.

The Booth Line.—Following negotiations by the Hull Development Committee, direct sailings of boats of this line to and from Hull have already taken place and others are due.

Swedish Train Ferry.—It had been taken for granted that this ferry, if and when established, would run to Immingham, but the Hull Development Committee are hopeful of it being brought to Hull instead. Immingham was favoured as providing the shortest route to London, but if Hull gets a Humber tunnel the position will be altered. The Swedish authorities in London have informed the Hull committee that a deputation which visited Immingham recently was quite unofficial, and that they do not think the scheme will develop any further for some considerable time because, in the first place, the support of the Swedish Government was essential and that had not yet been obtained. They agreed with the suggestion that if the question of a Humber tunnel were decided Hull should stand the first chance of obtaining the service.

Dock Trust for Hull?—Mr. W. Minnitt Good somewhat surprised the members of the Hull Chamber of Commerce and Shipping, at their annual meeting, when he suggested the establishment of a Dock Trust for Hull. Mr. Good is the chairman of the Shipping Committee. He complains of the non-completion of the King George Dock, which remains as it was when it was opened in 1914. Hull lost its chance of having a dock trust in the nineties, when the original Hull Dock Company found itself in difficulties and transferred its estate to the then North Eastern Railway Company. The idea, once common, that the London and North Eastern Railway Company favoured its other ports to the disadvantage of Hull is not now held by any thinking men. Hull is the largest port under the control of the Company, and its capital investments in it are so vast that it would be suicidal to neglect it in any way.

South Wales Area.

Shorter Rail Route to Swansea.—Shortly before his retirement from the general managership of the Great Western Railway Company, Sir Felix Pole emphasised the importance to Swansea's future as a port of a more direct rail route to Swansea than exists. A conference has recently been held between representatives of the Ministry of Transport, the G.W.R. Co., the Swansea,

Digitized by Google

Neath, Port Talbot and Glamorgan (County) Councils anent bridging the River Neath and making a shorter road and rail route to Swansea and one which would emerge giving direct access to Swansea Docks. Three alternative schemes were discussed, and it was decided that the individual authorities represented should consider the matter.

Better South Wales Docks Year.—In the ten months ended October 30th, the South Wales docks of the G.W.R. Co., viz., those at Cardiff, Swansea, Port Talbot, Barry, Penarth and Newport had traffic of 31,667,261 tons, or 2,917,000 tons more than the first ten months of last year. Imports increased by 89,000 tons to 4,314,441 tons, whilst increased exports amount to 2,828,000 tons at 27,352,820 tons total exports. Coal and coke shipments were up by 2,765,000 tons, at 24,520,277 tons total, on last year's figures. A feature of late weeks shipping has been the use by the larger vessels of South Wales docks.

Good Work at Port Talbot.—An instance of quick loading has been afforded at Port Talbot. The Steamer "P.L.M." arrived at the docks on November 6th at 8.50 a.m. to load 5,185 tons cargo and 445 tons bunkers. Loading commenced at a single coal hoist at 3.25 p.m. and was completed by 3.50 p.m. on November 7th, the vessel leaving with the evening tide. Net working time was fourteen hours, and loading rate 403 tons per hour.

Probable Large Expenditure at Swansea Docks.—It is understood that in addition to the £5,000,000 already announced to be spent by the G.W.R. Co. on its docks and depots the sum of £1,000,000 is to be devoted to Swansea docks improvements. The new lock gates for which the Chamber of Commerce has agitated as an alternative locking system for the docks are, it is understood, to be provided.

L.M.S. Developments at Swansea.—The L.M.S. Railway Company proposes to erect two anti-coal breakage devices at Prince of Wales dock, Swansea. The machinery was recently demonstrated to coal companys, chambers of commerce representatives, etc., at Ellesmere Port. Some slight modification in the machinery demonstrated is to be made at Swansea.

Irish Ports.

Direct Trading Between Waterford and Hamburg.—Direct trading has been established between Waterford and Hamburg. The Limerick Steamship Company made arrangements for regular sailings between both ports, and shippers and exporters at Waterford are now afforded facilities for forwarding Irish products direct to Hamburg and importing merchandise from the Continent, which is proving beneficial to the trade of the port of Waterford.

Providing Cold Storage Accommodation at the Port of Limerick.—The Limerick Harbour Commissioners have taken practical steps to provide cold storage accommodation at the port for the benefit of trade and the convenience of shippers of butter and eggs to Great Britain. A spacious building adjoining the quays is being fitted up for this purpose at a cost of £645, and a firm of electrical engineers in Limerick has secured the contract for the installation in this reconstructed building of suitable cold storage plant, at a cost of £238. These desirable improvements, when completed, will be a decided acquisition to the port, and the trading facilities afforded thereby will be very advantageous for cross channel transport.

The Port of Galway and Transatlantic Goods and Passenger Traffic.—At a meeting of the Dublin Rotary Club Mr. T. J. W. Kenny delivered an address dealing with the City of Galway and the progress it was making in recent years. In the course of his remarks he said that up to 72 Atlantic liners had already been scheduled to sail to and from the port of Galway in 1930. In order that better facilities might be available in Galway harbour for the embarking and disembarking of passengers and the transport of merchandise to and from Atlantic liners, the Galway Harbour Commissioners had during November purchased a steam tender capable of accommodating 2,000 passengers. Besides other improvements, plans were ready for the development of the commercial docks, so that they will in due time be available to ships of up to 6,000 tons at all states of the tide.

Overseas News.

Canada Coins New Word to Describe Special Railway Coaches.—A new word has been coined in Canada to designate the special single compartment railway coach recently introduced on fast expresses by the Canadian National Railways. The word is "Chambrette," a French-Canadian term meaning a small completely equipped, self-contained apartment. "Chambrettes" are all-steel railway carriages divided into a number of individual sleeping compartments for the convenience of business men and others who travel frequently between Montreal and Toronto, and who require private rooms in which to transact business while en route between the two cities. "Chambrettes" are used only on the Toronto-Montreal run, but have proved so popular that they will probably become standard equipment on the Transcontinental and International trains of the National system.

Agreement Between Swedish and American Shipping Companies.—A Stockholm message says that the shipping companies Svenska Amerikalinjen A.B., Svenska Amerika-Mexico Linjen and Rederiaktiebolaget Transatlantic, which collaborate in American trade, have concluded an agreement with Messrs. Moore and McCormack Co., Inc., of New York, acting on behalf of the American Scantic Line, for collaboration. The companies will follow a joint freight policy and arrange the voyages more regularly than hitherto. At least five fast runs a month to Stockholm will be arranged by the collaborating shipowners. As a result of this agreement, competition between the Swedish and the American shipping companies will come to an end. According to the papers an earlier agreement was concluded last summer between the same American Company and several Scandinavian and German shipowners, but this only referred to Baltic pulp freights.

Swedish Merchant Fleet.—Definite official figures now available show that the number of ships in the Swedish merchant fleet decreased during 1928 by 23, while the total tonnage rose by 93,877 gross tons to 1,571,569. The whole of the decrease took place in sailing ships without motor; real motor tonnage increased by 16 ships totalling 71,619 gross tons and sailing ships with motor by 37 ships totalling 4,374 tons. Between the beginning of 1913 and the end of 1928, the sailing tonnage in the Swedish merchant fleet fell from 1,547 ships and 180,174 gross tons to 1,042 ships and 92,683 gross tons. In 1928, fourteen big motor ships were constructed at Swedish shipyards for Swedish owners, while two were imported from abroad, including the liner "Kungsholm" of 21,611 gross tons built in Great Britain for Svenska Amerikalinjin. The statistics also indicate that increase in Swedish tonnage was largest for ships running exclusively between foreign ports. This tonnage increased during 1928 by 60,572 gross tons, while ships running between Sweden and foreign ports increased by 51,358 gross tons and those running on home services decreased by 35 ships and 9,313 gross tons.

Great Arterial Waterway for United States?—A Louisville message says that the development of the rivers and lakes of America into a gigantic arterial waterway—a task three or four times as great as the Panama Canal undertaking—was promised by President Hoover recently as one of the greatest objectives of his administration. President Hoover said that his programme would call for additional expenditure of 20,000,000 dollars (£4,000,000) a year, and asserted that this would equal the cost of half a battleship. "If we are so fortunate," he added, "as to save in annual outlay on naval construction as the result of the forthcoming naval conference in London, nothing could be a finer or more vivid conversion of swords into ploughshares." The 20,000,000 dollars referred to would be in addition to 10,000,000 dollars for the Great Lakes and St. Lawrence waterway and 85,000,000 dollars already being expended.

America's Bid for the World's Shipping Trade. — A Washington message says that the Shipping Board have approved a loan of 11,700,000 dollars (£2,340,000) for the construction of two combination passenger and cargo ships for the Oceanic and Oriental Steamship Co.

REUTERS TRADE SERVICE.—By special arrangement with Reuters Trade Service we are publishing news items from all parts of the world dealing with transport matters.

News from all Parts.

Belgian Centenary Exhibition. — A message from the Prince of Wales, who has consented to be patron of the Special Committee which is co-operating with the Department of Overseas Trade in organising the British section in the Antwerp Exhibition next year, was read at the inaugural meeting, held in London recently. In the course of his message His Royal Highness said that as Master of the Merchant Navy and Fishing fleet, he was particularly anxious that our great Mercantile Marine should be worthily represented, and would venture to suggest that, apart from the individual exhibits which many of our leading shipping lines would no doubt wish to make, a historic review of our progress in merchant shipping—a kind of Pageant of the Red Ensign—would form a very attractive exhibit. Mr. G. M. Gillett, M.P., Minister for Overseas Trade, presiding, explained that the International Exhibition at Antwerp from April to October, 1930, was to be primarily maritime and colonial. A really fine aeronautical exhibit, in which the Air Ministry would co-operate, was assured. The bulk of the space had been allotted to maritime industries—shipping, shipbuilding, transport and harbour facilities, and everything pertaining to navigation. It was practically certain that the great British railways would be represented. A number of the leading shipping lines were organising individual exhibits. While industries in general were to have their display at the Liege Exhibition, which is to run concurrently with the Antwerp Exhibition, Mr. Gillett explained that a small industrial court had been arranged in the British section at Antwerp for those British firms which specially wished to be there. The following were present:—Mr. G. M. Gillett, Parliamentary Secretary, Department of Overseas Trade; Mr. William Lunn, M.P., Dominion Office; Major the Hon. J. J. Astor, M.P.; Sir Wilfred Beveridge, London School of Hygiene and Tropical Medicine; Colonel H. W. G. Cole, Commissioner-General for the British Government at the Exhibition; Sir Edward Crowe, Comptroller-General, Department of Overseas Trade; Sir Francis Dent, C.V.O., Railway Clearing House; Mr. A. R. Mountain, Chairman of Lloyds; Mr. W. H. Newman, President, British Chamber of Commerce in Belgium; Mr. J. D. Ritchie, Secretary, Port of London Authority (Deputy for Sir William Thorne, Dock and Harbour Authorities Association).

Record Coal Shipment.—The L.N.E.R. report that the tonnage of coal shipped on the River Blyth up to November 21st, 1929, exceeds the tonnage for the whole of any previous year. 4,973,836 tons have been shipped this year as against the record year's shipment of 4,969,859 in 1927.

White Star Line. — The White Star Line's passenger office at 9 Chareh Kamel, Cairo, opened for the forthcoming season on December 2nd and will close on April 14th, 1930.

Shipping Lines Amalgamate.—His Majesty's Consul-General at Valparaiso (Mr. C. Graham) reports that, according to a report received from His Majesty's Consul at Magallanes, the shipping lines owned by Messrs. Braun & Blanchard and Messrs. Menendez Behety, both of Magallanes, are being amalgamated with a view to inaugurating a shipping service for Chile, Argentine, Uruguay and Brazil. It is understood that the new organisation will receive a subsidy from the Chilean Government in consideration of the extension of their service to the Atlantic Coast of South America.

Schenkers, Ltd. Manchester Office.—The Manchester office of Schenkers, Limited, Shipping and Forwarding Agents, has been removed from 19 Brazennose Street, Manchester, to 37 Peter Street, Manchester. The telephone number is City 0314 (3 lines).

A Useful Diary.—The P. & O. and British India Co.'s Diary and Almanack for 1930 contains a great deal of useful information. Particulars of the services maintained by the P. & O. S.N. Company and the British India S.N. Company, Ltd., are given, and there are maps, statistical tables, etc.

New Docks for Canadian National Steamships.—Approximately £150,000 is to be spent by the Canadian National Steamships between now and next summer in the remodelling and extension of its pier at Vancouver. The new structure which is expected to be completed by the end of May has become necessary through the decision of the Canadian National Steamships to extend its West Coast services for which three new turbine steamers are now under construction at Birkenhead. The new pier will be 1,500 feet long, 220 feet wide, and the approach to it will be through an imposing archway carrying the words "Canadian National Steamships" in letters 15 feet high which will be illuminated at night by neon lights. The main waiting rooms and offices will be in a building measuring 250 feet by 160 feet, and there will be, in addition, two large traffic sheds or warehouses, one measuring 980 ft. by 94 ft. and the other 980 ft. by 70 ft. Double railway trackage will enter the pier beneath the motor concourse and will continue on an incline to the centre of the warehouses. The new pier will occupy one of the most advantageous sites in Vancouver's magnificent harbour front.

Southampton Docks. — The latest endorsement of Southampton's supremacy as a Channel port for ocean passenger traffic comes from the Norddeutscher Lloyd, the most recent sailing schedule of which Company reveals the fact that Plymouth has been entirely abandoned as a port of call for homeward bound ships and that Southampton is the only British port included on the outward and homeward itineraries of the Company's North Atlantic services. Another interesting feature of this sailing list is that the new "Europa," sister ship to the "Bremen," will call at Southampton on her maiden voyage en route to New York on 20th March next. Several other large vessels are to make their inaugural trips from this port in the early months of 1930, and included amongst them are two new motor ships for the Java trade. The first of these, the Rotterdam Lloyd's "Baloeran" of 18,000 tons gross, will sail on 18th April, and be closely followed by the Nederland Royal Mail Line's "Johan van Oldenbarnevelt," 19,000 tons gross, which departs on May 8th. Both of these vessels represent considerable advances upon the present tonnage engaged in the ever-expanding trade with the Dutch East Indies. An ambitious summer programme entailing eleven more sailings from this port than for the past season has been arranged by the Canadian Pacific for next year. Since this Company commenced operations here a few years ago, each year has witnessed an appreciable increase in the volume of Canadian shipping dealt with, and the Company's sailings for 1930 total 59 as compared with 48 during the corresponding period of this year.

White Star Motor Vessel "Britannic."—The work on the new White Star Motor Vessel, "Britannic," is proceeding and it is expected that she will be delivered by her builders (Messrs. Harland & Wolff, Ltd.) early next year. It is interesting to note that the "Britannic" when she enters the White Star Line's Boston, New York service, will have the distinction of being the largest British Motor vessel afloat. Accommodation is provided for 1,550 passengers (Cabin, Tourist Third Cabin, and Third Class), the most notable features being the Swimming Bath and Tennis Courts in the Cabin Class, Children's playrooms and Elevators in the Tourist Third Cabin and Third Class quarters. The "Britannic" in conjunction with the "Cedric" (21,227 tons) will maintain a regular fortnightly service to Boston and New York from the Mersey port.

Port of Manchester. — The distributor based upon Manchester can bring his goods right up to Manchester by Ship Canal and deliver direct from shipside by rail, road or inland waterway. The port has unrivalled facilities for quick discharge and despatch of cargo; extensive shed, warehouse and open storage accommodation. In arrangement and equipment the Port is counted one of the most forward and efficient in the Kingdom. In the thirty-odd years of its existence it has by refinement of organisation advanced in importance until, to-day, it has attained the position of the country's third port, judged by the annual value of its imports and exports recently officially returned at over £115¾ millions. For full particulars concerning the Port apply to the Manchester Ship Canal Company, Ship Canal House, King Street, Manchester.

Port of Glasgow. — The Port of Glasgow is a general port, and is so equipped for all classes of traffic. The quayage is 19,228 yards (11 miles), with a water area of 324 acres and a land area of 211 acres. The Port is conveniently situated in a commercial and shipbuilding centre, surrounded, within a radius of 20 miles, with numerous coalfields and iron works, and is well equipped with the most modern facilities for the reception and shipment of all classes of goods. For the reception of general goods, there is provided single and double-storey sheds, having a total floor length of 8 miles, from 55 to 100 feet wide with crane and other facilities. Mr. Jas. Macfarlane is the General Manager to the Clyde Navigation, and his address is 16 Robertson Street, Glasgow.

Railway Notes and News.

G.W.R. New Director.—The Directors of the Great Western Railway have elected Sir Percy E. Bates, Bart., G.B.E., to fill a vacancy on the Board.

L.N.E.R. Appointments.—We are officially informed that the London and North-Eastern Railway Company have made the following appointments:—Mr. W. J. Pepper, Assistant to Divisional General Manager, Southern Area, to be Assistant Passenger Manager, Southern Area. Mr. H. F. Sanderson, Assistant to District Goods and Docks Manager, West Hartlepool, to be Assistant District Goods Manager, Newcastle-on-Tyne.

Appointment.—Mr. G. L. Darbyshire has been appointed chief officer for labour and establishment of the L.M.S. Railway.

Railway Rates Tribunal.—Sir Walter Baker Clode, K.C., has been re-appointed president of the Railway Rates Tribunal for another year.

Southern Railway. New Director. — Viscount Folkestone, of Alward House, Salisbury, has been elected a director of the Southern Railway Company.

London and North Eastern Railway Steel Containers.—The London and North Eastern Railway has recently placed in service a number of steel containers of the large covered or "B" type. The containers have been built by the Metropolitan-Cammell Carriage, Wagon and Finance Company. The containers are provided at one end with the usual arrangement of doors, i.e., two upper folding doors and

L. & N.E.R. "B" TYPE STEEL CONTAINER.

one lower flap door, the other end being fixed. The internal dimensions are as follows:—length 13ft. 10ins., width 6ft. 6ins., height (at centre) 6ft. 8ins. They are built to carry a load of 4 tons, the tare being 19¾ cwts. The usual wire rope lifting slings are fitted. Ample ventilation is provided by means of two hood ventilators at each end and by a protected opening at the eaves for the full length of the container. In addition to the 175 containers of the type illustrated, a further 25 for perishable traffic will shortly be in service; these are provided with three tiers of removable shelves and additional ventilation at the fixed end. Thirty Steel Containers are also being built for Continental Traffic. These are fitted with locating attachments on the roof to enable them to be stacked securely in the holds of the Company's continental steamers.

G.W.R. Million Pound Steel Orders.—New Works commenced. From the December issue of the Great Western Railway Magazine, we learn that steel work and machinery to the value of £1,000,000 are being purchased by the G.W.R., including 123,000 steel sleepers, 50,000 tons of steel rails which will be required for laying the 51 miles of track to be completed within the next 12 months. Work has already commenced on various undertakings authorised under the Government's schemes to relieve unemployment. The schemes, which involve a total expenditure of £5,000,000, include rebuildings at Paddington, Bristol, Cardiff and Taunton Stations.

L.N.E.R. Wagons.—The L.N.E.R. have placed contracts for 1,000 12-tons mineral wagons with the following firms:—S. J. Claye, Ltd., Long Eaton; W. H. Davis & Sons, Ltd., Langwith Junction, Nr. Mansfield; The Birmingham Railway Carriage and Wagon Co. Ltd., Smethwick; Hurst, Nelson & Co. Ltd., Motherwell; Chas. Roberts & Co. Ltd., Horbury Junction, Nr. Wakefield; Metropolitan Cammell Carriage Wagon & Finance Co. Ltd., Vickers House, Broadway, S.W.1.

G.W.R. Purchases.—The Great Western Railway Company is purchasing 76 motor and 100 horse-drawn freight vehicles.

London and North Eastern Railway Magazine.—The December issue of the L. & N.E. Railway Magazine consists of 62 pages of letterpress and illustrations and contains a "worth framing" loose plate of a L.N.E.R. Shire-class locomotive. Among other main features are the following: A technical article on Poppet Valves for Locomotives, a description of the Controls on the L.N.E.R. (England and Scotland), contributed by Mr. C. M. Jenkin Jones, with a map specially prepared showing the lines controlled from the various centres. "Train Signalling," 2-position and 3-position telegraph apparatus.

Railway Improvement Schemes.—Additional Developments to be undertaken by the L.N.E.R. The London and North Eastern Railway report that under the Passenger Duty Capitalisation Scheme, the following additional works have now been approved:—HULL: New Goods Arrival Sidings. The construction of new Marshalling Sidings on a site near the Priory Yard Mineral Sidings. The whole of the inwards goods traffic arriving at Hull will be dealt with in the new group of sidings, which will be served by six new reception lines each capable of holding a train of 80 wagons. Trains arriving will be shunted from these new reception lines over a hump, and sorted by gravity into a balloon-shaped yard consisting of four groups of 15 sidings, each siding holding 60 wagons. MOTTRAM: Marshalling Sidings between Mottram and Dinting for Down traffic. SOUTH LYNN: Additional Sidings, Goods Shed accommodation, etc. This proposal is being carried out in co-operation with the L.M. & S. Company and should effect an improvement to the M. & G.N. Joint Railway.

American Appreciation of Great Western Railway Posters.—A tribute to the railway poster art is shown by the fact that American visitors during the last few months have purchased hundreds of G.W. posters which they have seen and admired during the travel over the Company's system. Many have been purchased by teachers and masters on vacation for exhibition in the schools and colleges of the United States.

More Wagons for the L.N.E.R.—The L.N.E.R. report that they have recently placed orders for 300 quintuple bolster wagons—100 to be supplied by Messrs. R. Y. Pickering & Co., Ltd., and 200 by the Metropolitan Railway Carriage & Wagon Co., Ltd. These wagons are required principally for conveying girders, which are being carried in increasing quantities owing to the renewed activity of steel works in the Middlesbrough district. The wagons can also be used for the conveyance of plates, bricks, road stone, wheeled vehicles, and general goods of all descriptions.

Change of Address.—The London address of the Traffic Advertising Department of the Canadian National Railways is now 17-19, Cockspur Street, London, S.W.1, instead of British Columbia House, 1, Regent Street, London, S.W.1.

L.N.E.R. Contracts.—The L.N.E.R. have placed orders with the North British Locomotive Company for fourteen locomotive boilers and with Messrs. Kitson & Company, Leeds, for ten locomotive boilers for delivery at their Darlington works. An order has also been placed with the North British Locomotive Company for ten boilers, and with the Yorkshire Engine Company for ten boilers for the L.N.E.R. works at Stratford.

Financial Reorganisation for Canadian Railway. Sir Henry Thornton's Scheme.—Addressing the Empire Club at Toronto, Sir Henry Thornton, the President of the Canadian National Railway, said that he hoped to present to Parliament in the coming session a scheme for the reorganisation of the financial structure of the Railway. The scheme would provide for the writing down of the present capital charges to figures representing more truly the actual financial structure of the system on the basis of actual investment, while at the same time taking advantage of the progress of the past few years in translating former liabilities into assets. Sir Henry stressed the co-operation and happy relationship between the company and its employees, and declared that labour conditions in the Railway were most satisfactory.

Air Transport Notes.

Safety First Air Tests.—An interesting test was carried out recently on an Argosy aeroplane on its delivery to Imperial Airways. The aeroplane was loaded up to its full capacity of 5,000 lbs., with petrol for 4 hours. There was very little wind but the weather was hot and the air somewhat bumpy. The aeroplane left the ground in 11 seconds and climbed to a height of between 2,000 and 3,000 feet. Each of the Armstrong Siddeley engines was then switched off in turn for a period of 10 minutes, and the aeroplane was flown on the two remaining units. It was found that a height of over 2,000 feet could be maintained with any one engine stopped while flying at an air speed of between 75 and 80 miles an hour. The performance was a little better with the two wing engines running and with the centre engine stopped, the aeroplane climbing steadily in this condition. The behaviour of the engine that was switched off was interesting. At first the airscrew continued to turn the engine at a very slow speed, but after about five minutes it stopped. In order to start the engine again the aeroplane was speeded up to about 100 miles an hour by driving slightly. The aeroplane has the newest type of 460-510 h.p. Jaguar engine, with reduction gear. It is interesting to know that one of these engines has flown more than 450 hours without overhaul, and at the time of writing is running as well as ever.

The First Municipal Aerodrome. — Several municipal authorities are constructing aerodromes, and many have sites in view; but the Bristol Corporation will be the first in the field in this direction. Its new aerodrome will be ready in January. In this connection the Corporation's Town Planning Committee reports that in July it decided upon the establishment of a municipal aerodrome and the expenditure of £13,200 for the erection of a club house, public hangar and workshops and for other necessary works. The Committee has entered into contracts for these items and the work is proceeding, and it is anticipated that the Aerodrome will be in a condition to be used and for the Bristol and Wessex Aeroplane Club, Ltd., to take up their quarters in January next. In connection with the development of the Aerodrome the Committee has given consideration to the leasing of the land and buildings to manufacturers and agents who may desire to establish works and showrooms on the site for the purpose of repairs, etc., and for the sale of aeroplanes, and in this respect it has been in close co-operation with the Aeroplane Club. The Committee is convinced that for the future expansion and well-being of the Aerodrome it is essential to encourage manufacturers and agents to establish works and businesses thereon. The Committee has had plans and estimates prepared for a showroom, 42 feet by 36 feet, with 20 feet concrete apron and a 6 feet path, the design of which is uniform with the club house buildings. The estimated cost of the building is £800. The Committee is of the opinion that the proposition is a satisfactory one. It also thinks it desirable that a number of private lock-up hangars should be available for rental by owners of machines. It is estimated that the cost of a range of three such private hangars, each about 30 feet by 12 feet, will be £600, i.e., £200 per hangar, and they ask the Council to authorise them to borrow the necessary money. It is anticipated that each lock-up will command a rent of about £40 per annum. As before-mentioned, the Committee hopes that the Aerodrome will be ready and opened in January next, and it is of opinion that a pageant should be held on the occasion in order to give the aerodrome the greatest publicity, but as weather conditions are often unsatisfactory at that period of the year, it thinks it advisable that the official opening should take place in the Spring so as to afford a more favourable opportunity for a successful function.

Commercial Air Traffic Between America and Canada. New Agreement.—A Washington message says that a new reciprocal agreement between the United States and Canada in regard to commercial aviation has been announced. The agreement deals with the admission into both countries of civil aircraft, the licensing of pilots and the acceptance of certificates of airworthiness for aircraft imported as merchandise.

More "Bristol" Jupiters for the Danish Air Force.—An order for the supply of 16 "Bristol" Jupiter Series F engines has been placed by the Danish Military Air Force with the Bristol Aeroplane Co., Ltd. These engines are in addition to a number of "Bristol" Jupiters supplied to the same Government earlier in the year.

The Largest Aircraft in the World.—The Dornier Company fitted the mammoth Dornier Do. X.—the largest heavier-than-air machine which has ever taken the air—with twelve Jupiter engines. On the first public flight, after the usual constructors' tests had been completed, no fewer than 169 persons were carried on the machine, together with sufficient fuel for 750 miles flight. The flight, which occupied fifty minutes, was entirely successful. Despite the fact that the weight of the machine with its load was not less than 50 tons, it took the air with ease and grace and proved itself easy to handle and to land. The engines are mounted in tandem in six cells on the wings and are all controlled from a single engine room. The success of this machine marks an enormous forward stride in the direction of the possibilities of the extended use of large multi-engined commercial aircraft, and its initial flights have been watched with keen interest by those connected with aviation throughout the world.

Air and Rail Combined Goods Service.—Negotiations have been concluded between Imperial Airways and the railway companies for a comprehensive rail and air goods service, enabling goods to be sent from over 100 provincial towns by train to London to connect with Handley Page Napier air freighters to the Continent at through rates. This will enable goods to be booked through by rail and air from manufacturers to consumers on the Continent.

Air Mail Between Argentina and United States. — A Buenos Aires message says that an official decree announces that arrangements have been made for a Pan-American air mail, linking the Argentine with the United States.

The Cairo-Cape Air Route.—Surprise at, and appreciation of, what has already been done in Capetown in connection with the establishment of an air route from Cairo to Capetown was expressed by Captain Tymms, representing the Air Ministry, at a mayoral luncheon at Capetown last month. Mr. Wolley Dodd, of Imperial Airways, also expressed appreciation, and declared that if their reception in Capetown were to be taken as an omen, they were going to carry the project to a successful conclusion. Captain Tymms said they had expected to encounter certain difficulties, but these had been cleared away already and all they had to do was to discuss the details. They had inspected the site for the proposed aerodrome, and he was of the opinion that when the surface was cleared and levelled there would be a magnificent aerodrome. Captain Tymms intimated that the Governments of all the territories along the route had agreed to an air service in principle, and all that remained now was to go into the details. The flight, as at present arranged, would take twelve days, but later, when night flying was permitted, this time would be reduced to eight, nine or ten days.

Air Services in Australia.—A Wellington, N.Z., message says that in an interview at Auckland, Captain Kingsford-Smith, the airman of "Southern Cross" fame, said that the idea of completing his world circuit by a Trans-Atlantic flight appealed to him because it would be a sort of missing link in the chain already made. His immediate concern, however, he said, was the establishment of regular air lines linking up Melbourne, Sydney and Brisbane. A daily service would be run between Sydney and Brisbane, and early next year night flying to Melbourne would commence.

Planes That Will Carry 500 Passengers. Monster Machines That May be Built in United States.—A Newhaven, Conn., message says that a super-plane, accommodating 500 passengers and a crew of 104, and capable of making the crossing from New York to London in a few hours, may be built in New York in the near future, according to Mr. Harry Westcott, the president of a firm of Newhaven engineers which has been asked to submit tenders for the structural work. The plane was described at an informal luncheon given at Newhaven, Conn., to a few guests prior to the breaking of the ground for a new municipal airport. It would have twelve 1,000 horse power engines and would be designed to overcome wind resistance at an extremely high altitude. Beyond the fact that German engineers had been consulted regarding engine power, Mr. Westcott would not divulge any further information. He said that he had seen drawings for the plane, and that the plans called for the construction of two of them at a cost of about 5,000,000 dollars (£1,000,000) each.

New Garage Equipment at the Commercial Vehicle Show.

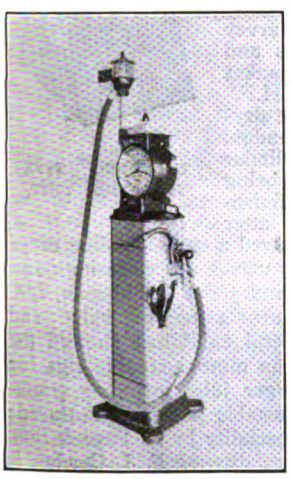
Service Equipment for a Daily Routine and for maintenance Requirements of average owners.

A TWO years' interval between the industrial vehicle shows, has the double advantage of providing a desirable interval for progress and development, and of enabling the advance to be better appreciated. From this standpoint, the recent Show disclosed a generally satisfactory if not wholly idealistic progress in commercial garage equipment. This equipment may be regarded from the aspect of a vehicle's daily routine, and the facilities for its maintenance. The requirements of the daily routine obviously are limited to the plant for fuelling and oiling, and washing, blowing up air tyres, and watering, and vacuum cleaning, while maintenance plant of the sort immediately concerned, provides for testing and adjusting of the brakes, wheel alignment, and (within recognised limits), attention to the electrical mechanism, and tyre repairs. The following review discusses the items concerned in both these categories.

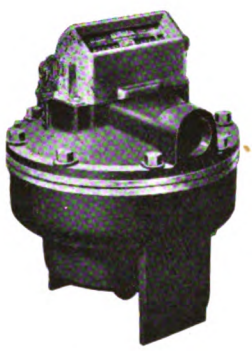
New Daily Routine Plant.

Fuel Flow Meters.

The tendency is for commercial vehicle users to put down bulk storage plant for fuel and oil, in both cases with self-metering and totalising recording mechanism. Excellent one-gallon metering hand pumps for both requirements are obtainable from the bulk of the fuel and oil pump firms. Larger users are being provided with a quicker fuel servicing metering plant of the continuous flow type with power drive or with hand pump for emergency use. A flow rate of 20 gallons per minute is obtained with this outfit, and the supply and power drive are automatically controlled, besides which there is the usual hand switch for cutting out the plant at will.



THE BOWSER "XACTO" SENTRY PETROL PUMP.



THE BOWSER FLOW-METER

In one form (the Bowser), the nozzle cock on the end of the outlet hose cannot be housed in the casing (its normal position), without switching off the current as a meter control. The motor rotary pump may be placed and operated from any point or distance; the fuel being piped to the one or more metering dispensers required as so many draw-off points. Of course, more power and larger pumps are required as the requirements increase, *e.g.*, the Hammond outfit provides for a 3 h.p. pump installation to supply 80 gallons per minute from four metering draw-off points. The Bowser outfit includes the "Xacto" (patent) meter, which has recently been passed by the B.O.T. for use at retail fuel stations. The Hammond outfit at present is limited to bulk or private users' installations, and has been installed in a number of 'bus garages.

In operation, the flow and rate of flow through the nozzle cock depends on the opening or closing of the dead-man (self closing) nozzle cock. The quantity passed through is metered and indicated by a large dial-gauge, the needle continuing to move round the dial which is scored for a maximum of 20 gallons, and then recommences. This movement ceases automatically with the closing of the nozzle cock, but the motor pump continues to circulate the fuel, by-passing it in one case to storage, and in this make, merely round the pump's circuit, which prevents aeration. The usual course is to stop the power unit after each serve.

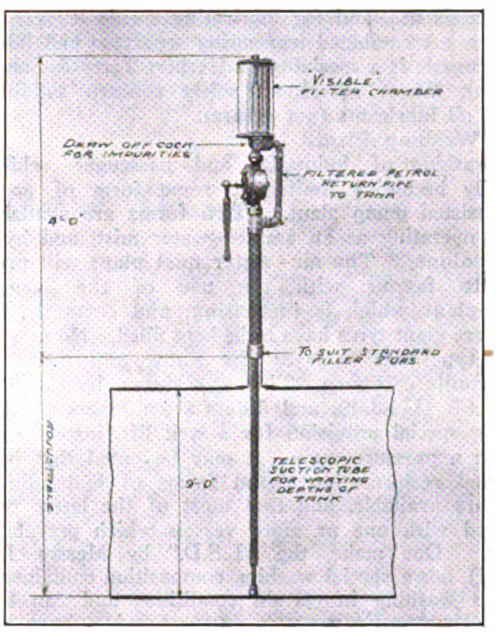
Other pump makers have adaptations of their standard fuel pumps for the continuous supply needs of large users. The control is automatic, and the metering and other features are specially arranged to suit the requirements and conditions for the average quick serving plant.

Checking Fuel into Bulk Store.

Where a bulk fuel storage equipment is installed, it is very desirable to be able to check the input from oil tank wagons as well as the output to the owners' own vehicle tanks. The latter he is assured of by the metering dispensers above referred to, but for the other, hitherto, most users have been contented to rely on a graduated depth stick; the alternative being a comparatively costly apparatus of the sort used in laboratories. The Bowser Co., have applied their "Xacto" fluid meter for this purpose, and it can be fitted, either as a permanent installation with the necessary supply points to a battery of storage tanks, or in the portable trolley form.

A Fuel Tank Cleaner.

Another desideratum in bulk fuel storage is a means of cleaning the tanks without having to open them out, causing delay and some risk from latent gas. Liquid Measurements, Ltd., (London), have a special portable sludge extracting pump for this purpose. The suction pipe is telescopic and passes through the air vent pipe hole in the man-hole. The sludge is trapped in a special chamber and the filtered fuel is returned to the tank. A simple hand oscillating wing-pump supplies the suction, and forms part of the outfit.



THE HAMMOND TANK CLEANING UNIT.

Oil Metering Plant.

The oil serving plant for industrial vehicles is mostly of the semi-portable and portable forms. In all cases a metering pump forms part of the equipment with a non-drip draw-off pipe and filter catch tray. The pumps can be adjusted by stops to supply from half-pint to a half or one gallon in some cases. At the recent Show, a neat form of portable metering oil tank was shown by Oil Installations, Ltd. It holds 30 gallons, and the overall width of the unit across the trolley axles is under 16 in. The tank is narrow and oblong, and is mounted on trolley wheels. This unit was specially designed for use in bus and similar garages where vehicles are garaged in rows, with limited space between them.

Where lubricating oils have to be handled in some variety, an increasing use is being made of air pressure oil serving units of the cluster type. At the recent Show, besides the now well-known Bowser eight-cluster pneumatic oil fountain operated by air from a storage compressor, there was a new model shown by Andrew Page & Son, of Leeds. This has a rectangular casing with four vertical sliding lock-up panel

Digitized by Google

doors; the Bowser and others having a circular casing. Another comparatively new form of oil serving cluster unit is the Sydney Smith, by a firm of that name with offices in Aldwych House, W.C. This type serves either three or six oils, and the power used is vacuum or negative pressure in a cylinder by means of a foot or lever operated piston.

Finally, as a type of the hand-carried oil supply unit may be noted a novelty by W. Clark, London, which combines a half-gallon oil can with an open top and an internal valve with handle control from the outside. It has a flexible metal spout which can be bent to suit the sometimes awkwardly placed oil-fillers of engines. The important feature of all this sort of bulk fuel and oil storage and usage installation, is that it embodies the ideals of safety by preventing waste, and economy by substituting mechanical for manual handling.

Cleaning and Re-filling Gear Boxes, etc.

The discharge and re-filling of gear-boxes and axle-cases can be expedited with cleanliness and safety by immunity from oil drippings, etc., by two complementary outfits. The first is the Fry-Wayne (Wayne Tank & Pump Co., London), flusher which consists of a portable 10-gallon tank-container with a motor, and combined vacuum and force pump for extracting the dirty lubricant followed (or preceded) by flushing the interior with paraffin or a special flushing oil mixture. This unit will serve 50 vehicles before the tank needs cleaning out. The complemetary plant is featured by W. Clark (London), and consists of a trolley tank with pressure ejected lubricant which passes through a metering valve, and indicates the quantity passed on a dial-gauge. The Tecalemit and other firms showed somewhat similar oil-changing units, including oil sprayers and cleansers for under chassis use, and for lubricating spring leaves, shackle points, etc. A combined leaf-spring separator and lubricant-injection nozzle is a speciality of Herbert Terry & Sons, Ltd., (Redditch). These references solely concern solidified oil or liquid oil lubricants (not grease).

Vehicle Washing Plant.

The washing of industrial and passenger vehicles is necessarily becoming limited to some form of power or power assisted pump plant. Two forms are available, air pressure operating as an aerated water mist, and hydraulic pressure alone. The air-water mist plant will probably return to favour with the use of the larger air storage plant which is increasing, and certainly has its place where giant tyres have to be kept filled. No new arrival of this type was seen at the Show and only one in the hydraulic category. This was shown by C. Churchill & Co., Ltd., (London), and differs from others of the type in having special provision for a well lift, instead of being fed from a pressure main. It may be noted that both the rotary and reciprocating piston forms of hydraulic power washer are available, and that most of the latter type are now fitted with one or more vessels which prevent water hammer. One make, the "L.S.D." by Messrs. Laycock (Sheffield), has a special washing composition container which facilitates washing in certain conditions and can be used at will. Harvey Frost & Co., Ltd., London, have now an alternative power drive for their Hydroforce hydraulic washer. It consists of a sole-plate with the washer at one end belted to a hopper-jacketed Lister petrol motor. The engine, of course, can be used for other purposes at will. The belt-driven power washer is featured by several makers of pressure washers, the power required apparently being about 1 to 1½ h.p. per gun or draw-off point. Messrs. Laycock have a speciality over-head power washing rig operating on the pressure flow-in or snilling system, much used for double deck buses.

Pneumatic Pressure Plant.

The supply of more adequate capacity air storage sets is happily increasing, and the cost is tending to be lowered. A 10 cubic ft. per minute compressor set is likely to be the standard for most users, because of the many uses there are for pneumatic power. The Show did not reveal any novelty in this direction except a new air and water tower by Bristol Pneumatic Tools, Ltd. (Bristol), and at least one combination of compressor and vacuum cleaner by Andrew Page & Son, Ltd., and Brown Brothers, Ltd. (London), who have added to their "Hardie" range of garage plant three sizes and types of portable vacuum cleaners, and air and water towers in two sizes, and an adjustable stand-type flood-light. Use of the latter is developing, though if they are to be portable, the wiring, etc., must be carried out in conformity with the electrical and insurance authorities' regulations.

The increasing use, both of giant air tyres and the tendency to adopt the medium or lower pressure type (representing roughly a pressure difference of about 50 per cent.), is an important factor in the call for larger air compressor plant. Low pressure giant air tyres require to be kept inflated to the prescribed pressure, and have a much smaller margin of abuse or neglect in this regard than high pressure similar sized air tyres. Air tower or stand pipe units are mostly provided with a self-coiling hose-line, and have some form of automatic stop controller which can be set to act when the required pressure is attained in the tyre. The readings being indicated by a large dial-guage, uniformity for a set of tyres is assured. The combination of a water hose and air stand is largely featured, but a scope for the dual layout in a user's garage is not as large as the call for both on their own. For those who prefer a ceiling type of air pressure hose for tyre inflating and other uses, there is the "ECO" unit, by Equipments, Ltd. (London), which was shown in both the floor-stand and ceiling or roof suspended forms.

THE "ECO" TYPE INFLATION UNIT.

New Maintenance Plant.

Light Power Tools.

To review this section adequately, is beyond present space limits. A few pointers will suffice to cover the smaller categories of exhibits. De-carbonising and associated hand tools have an auxiliary in a new 8 lb. air motor by Bristol Pneumatic Tools. In its larger sizes, and the increased capacity, it is equal to operating a cylinder hone or re-grinding tool. This class of tool, of course, requires an adequate air storage plant; the smaller motor consuming about 9 cubic ft. of free air per minute. Some exceedingly tough but not brittle steel hand tools (chisels and screw drivers, etc.), were shown by E. P. Barrus & Co., (London), and Harvey Frost and Co. Brown Brothers and others showed the use of various makes of cylinder hone, the latest in the "H.F." range being a remarkably effective dry-grinding hone. W. Clark, London, showed the "Storm," a dual cylinder bore-rectifying outfit, one unit being for re-boring, and the other for finishing the bore by honing, or for the latter use solely. This exhibitor also showed a corresponding range of "Buma" tools for re-seating valves by cuttering-down the seats and re-fitting new ones, and Jones & Shipman, Ltd. (Leicester), showed their well-known range of valve and valve-seat hand cutter tools. Several exhibitors showed the Black and Decker and Van Norman motor-grinding rigs for valve seats and tools; and for larger jobs, including crank-case bearing, honing bars with adjustable feed were featured; a new comer in this line being a speciality by A. Page & Son. Electrical servicing tools are a speciality of F. J. Gordon & Co., Ltd. (London), and the range is complete from a hydrometer for testing the acid density to a round of battery re-plating and repairing tools and accessories.

Long Reach Jacks.

The needs as to rear overhanging, and a low axle clearance of coaches, and other matters, are catered for with long reach jacks, both of the mechanical and hydraulic lift types, by a new type of wheel ramp by Lake & Elliott, Ltd. (Braintree, Essex), and by Harvey Frost and others, who handle the special Weaver wheel-dolly, and the "Hyer lift" and similar forms of cantilever jack enabling vehicles to be partially up-ended for examination and removal of tyres and wheels.

Brake Testers.

Brake testing plant is in two categories, viz., (1) portable for use on one wheel at a time or per two wheels taken in turn, but both raised simultaneously, and (2) a permanent floor-type of plant on to which the vehicles are driven and the brakes tested and adjusted *seriatim* per wheel and set, and all four adjusted as a final test. The latter type being necessarily large, could not be shown. The two makes concerned are the Cowdray (Bendix Perrot Brakes, Ltd. (Birmingham), and the "Jumbo" (W. Clark, London). The portable type includes the "H.F.-Welch" (Harvey Frost), "G.E." (Bradbury & Co., Ltd. (Braintree, Essex)—both these sets can be used in pairs per axle and the readings compared, and the "Linendoll" (Delco-Remy & Hyatt, Ltd. (London)—this implement being a combination of spoon tyre brake or resistance hand dynamometer with dial resistance gauge.

Digitized by Google

Wheel Alignment Plant.

Testing plant for wheel alignment is of two kinds. The larger and more important sort is illustrated by the Weaver plant (Harvey Frost & Co., and others), and consists of a pair of floating side-skids, on which the wheels of the vehicle to be tested are run over slowly. Any irregularity of alignment (toeing in or out), is indicated in degrees by a dial-gauge on a stand column, the gauge being calibrated right and left from a vertical (neutral) line; one side indicating that the wheels toe in incorrectly, and the other that they toe out incorrectly. A portable plant of the same make is available, and from observation of its working, it seems to meet all requirements. There is also a range of hand alignment gauges; most of the equipment firms supplying or making this type. That shown by Mann, Egerton & Co., Ltd. (Norwich), is a well made gauge, free from spring, and adjustable for track widths and other requirements at both ends of the chassis.

Electric light-servicing plant has a comprehensive range according to the extent of operation and test available, by means of a given plant or rig. The larger plant provides for every form of test and testing point required for lighting and ignition sets and wiring. The Weidenhoff (Autocar Electrical Co., London), and the Hobart (F. J. Gordon & Co., London), are of this kind. The Hobart includes a special hand testing set (the Hoyt), for tracing faults in the vehicle's circuit before dismantling the defective or suspected component. The other plant then is used to track down the actual source of the trouble in the component affected. Defective ignition test units are catered for by the smaller testing tests of Mann Egerton & Co., and Brown Brothers and C. Churchill & Co., samples of their respective plants and rigs being shown.

Giant Tyre Plant.

Giant tyre repairs can only be handled with a full equipment of the special plant designed for the purpose. This plant comprises:—

(1) Tools for stripping and buffing (cleaning) surfaces to be repaired.

(2) Special power or mechanically-assisted hand plant for removing covers from rims and for positioning them so as to get the seat of the repair into, and held fixed in a working position.

(3) Some form of portable hoist or overhead runway.

(4) A wheel dolly for operating in conjunction with the wheel jack for transferring a removed tyre-wheel for repair and for its replacement after repairs.

(5) A vulcaniser with a capacity equal to taking a 40 in. by 9 in. cover, and every sort of tread mould for external re-rubbering. Harvey Frost & Co., showed the complete plant enumerated; and Brown Brothers and A. Page & Son, the necessary plant less the new special H.F. vulcaniser for giant tyres.

Tyre spreaders or positioners are pneumatically operated from an air storage service, and the buffing units are motor or (in a few cases) air driven by rotary motors. Harvey Frost & Co., showed a new form of their "Robot" tyre changer, which is of the mechanically assisted hand type for dealing with large air-tyred rims. A companion tool for contracting and expanding split rims (favoured by American vehicle makers), is another of this firm's specialities. The B.E.N. Patents, Ltd. (London), showed a new portable tyre buffing motor rig, which, of course, like most portable plant, has a variety of applications. This firm showed also a compact and useful trolley mounted motor-driven air unit for tyre inflating, paint and other pressure spraying, and (as an extra), with a Tecalemit pneumatic lubrication unit for chassis.

We have not reviewed the more elaborate garage servicing plant such as vehicle power elevators and gantries with and without ramps, maintenance and associated plant for use in detailed overhauls and repairs, as not being essential in the average industrial vehicle and coach owner's garage.

The Institute of the Motor Trade.

MR. H. L. KENWARD, Sales Manager, Dunlop Rubber Co., Ltd., delivered his Presidential Address at a meeting of the Institute of the Motor Trade, held on November 19th. In the course of his remarks, he said, since 1926 the membership of the Institute has increased by 65 per cent. Our goal is to obtain for the motor trade a definite and honoured status. The accomplished and expert motor engineer must be regarded by the consumer in the same light as the public respects the accepted qualifications of surgeons and physicians. The manufacturer of the articles we sell must be encouraged to regard with preference the I.M.T. man, in the same way as the dispensing chemist prefers to deal with a qualified medical practitioner.

Our problem is not so much to make the Institute accepted by the motor trade, for the real status of the I.M.T. will be its valuation by the purchasing public.

That then briefly is our aim. Our standing must be such as will influence the patronage of the consumer, and we must do everything possible to make the motorist look towards the I.M.T. man for service in its highest form.

How are the public to know which firms employ or are owned by a man with I.M.T. qualifications—We must advertise the Institute.

Publicity is not necessarily inseparable from dignity. We can have all the dignity we want when every first-class man in the trade is a Member or Fellow of the I.M.T.

We now come to the much vexed question of examinations. For a moment, let us forget that particular word, and say that before a man can become a Member of the Institute, he must have high qualifications.

We are not so much concerned with academic distinctions as we are with useful experience, sound knowledge, and willingness to contribute towards the achievement of a proper status for the motor trade.

Now, as to the benefits we shall get from the development of the Institute. We shall all take out a little less than we put in, and those who will reap the fullest benefits will be those who are to follow us in an industry which means so much to the Nation.

It is obvious that the proper recognition of the Institute must be followed by increased business being given to its Members and Fellows. But that should not be the end of our present efforts.

We want the help of the manufacturers. We want them to help us with our publicity, to suggest lines along which we should work, to assist us in framing proper examinations, and to give us their own ideas of the future. In short, we want the complete co-operation of the manufacturers, and I think that if we ask them for it, we shall get it.

L.N.E.R. London City Manager's Staff Dinner.

THE Fourth Annual Dinner of the London City Manager's staff of the London and North Eastern Railway, was held on November 8th, in the Liverpool Street Hotel, when Mr. Percy Syder, London Manager, presided over a gathering of nearly 150.

Mr. E. T. Creasey, goods agent at Marylebone, proposed the toast of "The London and North Eastern Railway," and Mr. W. Mc A. Gracie, assistant goods manager, southern area, replied. Mr. T. J. Dove proposed the toast of "The Visitors," and welcomed the Mayor of Shoreditch (Ald. G. Reynolds, J.P.), and Mr. W. P. Bailey

In giving the toast of "The Chairman," Mr. T. R. Hamilton, goods agent at Bishopsgate, said that for nearly 14 years Mr. Syder had been their Chief. He had been in close association with Mr. Syder, whose sterling qualities had endeared him to all, and they would continue to do everything possible to help him in every way.

Mr. Syder, who was received with prolonged applause, said he was proud to be their Chief, but he did not want to be considered as an Officer only—his aim was also to be their adviser and friend, one whom they could always approach (hear hear). He wanted them to be happy in their work, because the happier the man, the greater was his output. He appreciated their loyalty. He was proud of the London District which had contributed to the satisfactory increase in receipts. Close co-operation would overcome all difficulties, and he was pleased to see how well all had worked together. He was delighted, he said, to see amongst them a member of his staff who held that most coveted decoration, the Victoria Cross, Mr. C. G. Robertson (loud cheers). He also mentioned the splendid musical programme provided by Mr. W. E. Phillips, and the hard work put in by the Committee, including the Hon. Secretary, Mr. A. C. Knight.

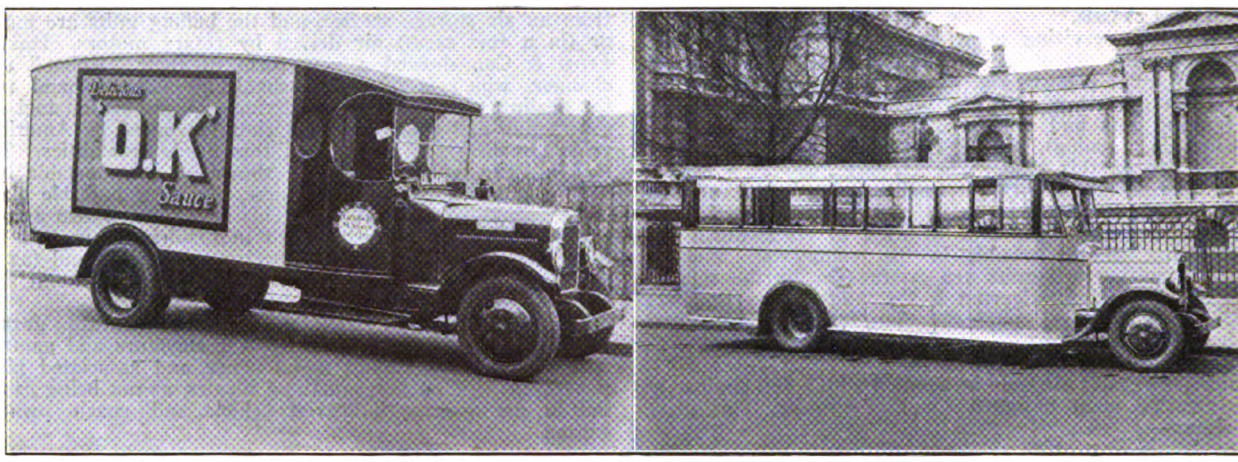
The Federal Chassis.

UNITED MOTORS, LTD., 27-34 Walnut Tree Walk, Kennington, London, S.E.11, sole concessionaires for the Federal chassis for Great Britain and Ireland, have now on the British market the following models:—(1) A 30-cwt. four cylinder model, price, short chassis, £335; long chassis, £340. (2) A 40-cwt. six-cylinder model, price, short chassis, £510; long chassis, £515; passenger chassis, £535. (3) A 40/50-cwt. six-cylinder chassis, sold in short, medium and long wheelbase sizes for goods traffic and similarly for passenger transport, prices, £570 to £625. (4) A 4-cylinder 50/60 cwt. chassis, sold in four wheelbase variations, ranging in prices from £715 to £740 with pneumatic tyres, or from £675 to £700 with solid tyres. Taking these chassis in the above order. (1) The 30-cwt. model has a four cylinder engine 3½ in. bore and 4½ in. stroke, with Ricardo head, forced feed lubrication, venturi carburetter, air cleaner, oil filter, petrol strainer and battery ignition; the engine develops 35 b.h.p., R.A.C. rating 19.6 h.p. It has thermo syphon cooling, a dry plate clutch and three speed gear box unit with engine. From the gear box to the spiral bevel driven rear axle, power is transmitted through a tubular propeller shaft. There are internal expanding brakes, semi-elliptic springs, cast steel spoke wheels with 30 in. by 5 in. pneumatic tyres. Worm wheel steering, 16 gallon petrol tank, grease gun chassis lubrication, and the equipment includes electric generator and starter. (2) The 6-cylinder 40-cwt. model, type F.7, has an engine with 3⅜ in. bore by 4⅝ in. stroke, developing 65 b.h.p. at 2,700 r.p.m. It has a four speed gear box unit with motor, a tubular propeller shaft and spiral bevel gear rear axle, detachable steel wheels with demountable rims fitted with 30 in. by 5 in. tyres. Grease gun chassis lubrication, worm and sector steering, dynamo lighting and self-starter. The weight of the chassis is 31 cwt., and the useful load capacity is 40 cwt. (3) The 40/50-cwt. six-cylinder chassis has an engine similar to the above, a Zenith carburetter, battery ignition, four speed gear box mounted amidships, tubular propeller shaft, spiral bevel rear axle, detachable steel disc wheels with 32 in. by 6 in. tyres, single front, twin rear, and in other respects it is similar to chassis type F.7. (4) The 50/60-cwt. model has a four cylinder engine, 4 in. bore, 5 in. stroke, developing 49 h.p. at 2,000 r.p.m., a three bearing crankshaft, battery ignition, single disc clutch, pump cooling, four speed gear box (separate unit), worm driven rear axle, cast steel wheels with solid tyres or spoke disc for pneumatics. Pneumatic equipment 32 in. by 6 in., single front, twin rear. This chassis is also sold with a six-cylinder engine.



LEFT: THE FEDERAL 30-CWT. BOX VAN, AND RIGHT: THE FEDERAL 24-SEATER COACH.

National Automobile Chamber of Commerce.

THE National Automobile Chamber of Commerce, 336 Madison Avenue, New York, annually holds prize competitions for the pupils and teachers of elementary schools in the U.S. In this manner an endeavour is being made to have school children take a greater interest in Street Traffic Problems and Regulations, with a view to bringing about thoughtfulness and thereby reduce motor fatalities. This year, for instance, the pupils had to write on the theme, "My Duty as a Junior Citizen to Observe Traffic Rules," each essay to be illustrated by an original drawing or photograph, or by an appropriate magazine or newspaper clipping. 442 gold medals and a similar number of cash prizes were awarded. Besides these the pupil submitting the best essay was awarded a gold watch and a trip to Washington with all expenses paid and was presented to the President of the United States. "The Training of Future Citizens in Street and Highway Safety" was the theme the school teachers had to deal with. Rewards of 500, 300 and 200 Dollars each were provided for the three best essays. These annual prize contests of the National Automobile Chamber of Commerce have produced satisfactory results by getting both school children and teachers interested in one objective—Traffic Safety.

More Visitors to the United Kingdom.—Carefully kept and analysed figures for passengers of nationalities other than British landing in the United Kingdom ports during the first nine months of 1929, ending September 30th, show an encouraging increase in the number of tourists visiting Great Britain, states The Travel Association of Great Britain and Ireland. Deducting residents of foreign nationality returning from abroad, passengers in transit to other countries, seamen, persons admitted with Ministry of Labour permits and 70,412 visitors on business, the total number of foreign visitors on holiday in Great Britain during the nine months was 209,909. The Travel Association has reason to hope that the invitation which it is sending to intending tourists all over the world to visit Great Britain will result in further increase in the total number of visitors during 1930. The offices of the Association are at Kinnaird House, 1, Pall Mall East, London, S.W.1.

New York Automobile Show.—The 30th Annual Automobile Show will be held at Grand Central Palace, New York, from January 4-11. There will be displays of 240 models, representing 46 makers of cars, i.e., 42 makers of domestic cars, 2 domestic cabs, as well as the showing of Mercedes-Benz and Voisin, automobiles. There will also be shown for the first time the new Cord, the Marquette, the Roosevelt and the Viking. In addition to these exhibits, there will be more than 200 displays by accessory manufacturers and makers of shop equipment.

"Borrowing" Motor Cars.—The Royal Automobile Club welcomes the action taken by the Home Secretary and of Sir Gervais Rentoul, M.P., in introducing Bills into the House of Commons to render it illegal to "borrow" a motor car or motor cycle without the owner's permission. The need for an alteration in the law in this matter is so urgent that it is to be hoped that one or other of the Bills will be passed through all its stages this Session.

Merseyside Notes.

FROM OUR OWN CORRESPONDENT.

State of Haulage Trade.—Conditions in the motor haulage industry have taken a more favourable turn during the last few weeks, and both cartowners and motor haulage contractors have benefited. In the food trades the offerings of traffic have been much more satisfactory. There is still considerable competition for loads from Liverpool to the Lancashire and midland towns with the usual accompaniment of cut rates. Since the railway companies have been making a bolder bid for traffic, haulage contractors have been exerting strenuous efforts to retain their hold on tonnage. Short cart and motor owners are fairly busy on building contracts.

The Mammoth.—M.R.S., Ltd., haulage experts of Liverpool, who have recently accepted delivery of a 14-wheeled vehicle capable of carrying a load of 100 tons, have named it the Mammoth after the gigantic crane of that name owned by the Mersey Docks and Harbour Board. This crane is capable of lifting 200 tons.

Passenger Transport.—All the motor coach operators in this district who send daily coaches to London have reduced their fares and it is now possible to make the return journey of about 400 miles for 20s. From Blackpool there are three daily services and the fares quoted are the same as those from Liverpool. The Blackpool motor coach owners have also revised their list of fares for the shorter journeys, and for bookings to Manchester and Liverpool the winter rates are single 3s., day return 4s., and period return 5s. 6d. Considering the quality of the coaches owned by the Blackpool operators, these fares are remarkably low. Long distance travellers not only enjoy the comforts of ultra modern vehicles with arm-chair seats, tables, electric light to each seat, but are provided with rugs.

An Old Wrong Righted.—The summonses which were issued against the Liverpool Corporation by Mr. W. J. Cornes of the Merseyside Touring Co., charging the Corporation with permitting their omnibuses to ply for hire within the city, without being licensed, have been withdrawn. The Attorney-General in the first place consented to the issue of the summonses in order that the point could be decided whether buses owned by local authorities should be licensed in the same way, and therefore subject to the same test for safety, as privately owned buses. As the Corporation accepted this standpoint the Attorney-General acquiesced to the withdrawal of the summonses. Mr. G. Justin Lynskey for the Corporation said the trouble started in 1898 when the Liverpool City Council delegated to the Tramways Committee the licensing of vehicles belonging to the Corporation. Private owners had to be licensed by the Watch Committee. In future the Corporation vehicles would be dealt with in exactly the same way as those belonging to other persons. When the Corporation's attention was called to the matter they promptly regularised that position and the duty of licensing these hackney carriages was delegated to the Watch Committee.

Liverpool Commercial Motor Users.—At the meeting of the Liverpool Area Committee of the Commercial Motor Users Association on 21st November, it was reported that a public inquiry would be held at Crewe on 18th December, into the application of the Cheshire County Council to place restrictions on certain roads in the urban and rural districts of Northwich, Redbury, and Romiley. It was also intimated that as the result of a deputation from the Standing Joint Committee of the Road Transport Associations, the Minister of Transport had agreed that existing eight wheeled vehicles 36 feet in length and those now under construction and registered before 31st March, 1930, would be permitted. After 31st March next, all new eight wheeled vehicles will be subject to the length limitation of 33 feet.

Warehousing Outlook.—The Liverpool Warehousing Company has had another prosperous year, the increase in profits being £10,792 over those of the preceding year.

A Secret of Success.—At the first annual ball of the Merseyside Touring Company, held in the Town Hall, Bootle, on November 19th, there was an attendance of 500 persons, including the Mayor and Mayoress of Bootle, and Messrs. W. Edwards, W. J. Cornes, G. F. D. Burrell and F. H. Paul (Directors). The Mayor of Bootle in a short speech said "Good feeling between Directors and employees is the secret of success in a business."

Trackless Cars Coming.—Liverpool Corporation is promoting a Bill in Parliament seeking powers to run trackless trolley cars. Although no definite scheme for trackless cars has been approved or discussed by the City Council or the committee concerned, in the near future the question may be seriously discussed. There is a great deal of support for such a service in the new housing areas, where it could be used to link up with existing bus and tram routes.

Lancashire Traffic Control Bill.—The Lancashire Traffic Board Bill which is being promoted by the Lancashire County Council, was drawn up after a conference of local authorities and provides for the constitution of a Board for the purpose of licensing and regulating passenger vehicles, particularly omnibuses plying for hire in the county. It will also confer upon the Board power to alter or amend any existing provisions affecting either the vehicles themselves, the drivers, or the conductors. The Board will have the power to impose conditions of licences relating to routes, stopping places, third party insurance, wages and conditions of employment, and the safety of vehicles and their passengers and make all necessary by-laws and regulations.

Transport Affinities.—Addressing a meeting of Runcorn businessmen, Mr. C. Hurst, a Warrington railway official, said there was abroad an opinion that the railway was the natural enemy of the haulage contractor. That was not the case. Each one had a definite work and if they both worked in co-operation much could be done for the community as a whole. The greatest risk to the haulage contractor was the other haulage contractor who cuts rates, and the end was not pleasant to contemplate in the light of economic ethics. The road powers granted to the railways had met with general approval and must benefit industry and the trading and travelling public.

New Screen Fitting.—Mr. Mazzini Stuart, J.P., of Liverpool, has invented a new type of windscreen, a feature of which is the fact that the wiper operates laterally, sweeping the whole or any given part of the glass screen. The wiper is driven by a small motor, and one of the most ingenious features is the rod which automatically sends back the rubber wiper on its journey, at any desired speed, when it has reached the end of the glass.

For Inward Services Only.—Blackpool Transport Committee has declined the application from Messrs. M. and H. Motors, Ltd., for permission to run a motor bus service out of Blackpool from the Talbot Road Bus Station. The reason given is that the municipal transport station is for inward motor services and the Corporation's motor bus traffic. If all the local bus services wanted to work from the bus station it would be impossible to deal with them.

Birkenhead Dock Improvements.—Big improvement schemes are contemplated at Birkenhead Docks and await the approval of the Government. The nature of the improvements have not been disclosed, but they are intended to provide some relief of the unemployment problem.

Agreement on Licensing Point.—The refusal of the Southport Watch Committee to renew the licences of the Ideal Bus Services, Liverpool, the buses to run in Southport, resulted in a Ministry of Transport inquiry at Southport last month. It was stated that the company had thirteen buses which plied between Liverpool and Southport only. For the six months ending last September, they carried 500,000 passengers, of whom 300,000 were conveyed into and out of Southport. On account of convictions for speeding in the borough, renewal of the licences had been refused in Southport. Application was made last July with respect to 13 buses, though up to that time only three had been run. After a private consultation between the parties, the Watch Committee agreed to renew three licences to the Ideal Bus Services, and to grant a new licence to enable them to maintain an efficient service. The licences expire on April 30th next.

Proposals for Liverpool Air Services.—With regard to the proposed aerodrome on the Speke estate, the Liverpool Corporation is making enquiries from the National Flying Services, Ltd., Alan Cobham Aviation, Ltd., or any other qualified expert as to the terms upon which they would advise the Corporation as to the erection of an aerodrome with particulars of the cost and other necessary information, or, in the alternative, what proposals they were prepared to make for the allocation by the Corporation of this site for the erection thereon by them of an aerodrome and the maintenance of running thereof.

Firestone Tyre and Rubber Company's New London Supply and Service Depôt.—The Firestone Tyre & Rubber Co. (1922), Ltd. have opened a new branch at Rochester Road, Camden Town, N.W.1. The new branch comprises warehouse and offices, and is fully equipped to give complete service.

Shires at Canadian Shows.—Shires at the British Columbia Fairs were outstanding attractions. At Vancouver the Shire entries numbered 43, which was well in advance of the other Heavy Horse sections, and similarly this was the case at Victoria and New Westminster. Lethbridge also had a great display of Shires.

Digitized by Google

Manchester Notes.

FROM OUR OWN CORRESPONDENT.

Manchester Air Services.—It has been decided that Northern Air Lines Ltd. will definitely remain in Manchester and that they will go to the Chat Moss Aerodrome shortly. The possibilities of Liverpool as an operating centre were recently discussed because of the lack of support from Manchester.

An Appropriate Change.—Rochdale Tramways Committee in future will be styled the Passenger Transport Committee. The explanation of the change is that the committee now operates 'buses as well as trams.

Horse and Motor Owners' Protest.—The Amalgamated Horse and Motor Owners' Association of Manchester has had under consideration a report of certain comments by the Bury county magistrates as to what they will do if defendants summoned for offences under the Motor Car Acts did not put in an appearance. They made it plain that in the event of a defendant not appearing or sending a letter, the case would be adjourned for a week and a warrant issued to be executed the day following the adjourned hearing if the defendant did not appear then. The Amalgamated Horse and Motor Owners' Association has decided to lodge a protest with the authorities against the issue of warrants for the arrest of defendants who, having sent a postal communication pleading guilty, do not appear in court.

New L.M.S. 'Bus Service.—Manchester Corporation Hackney Coach Sub-Committee has approved the application of the L.M.S. Railway Co. for permission to run a motor omnibus service between Halifax and Manchester.

A.E.C. Demonstration.—The Associated Equipment Company demonstrated one of their latest types of chassis carrying a body by Messrs. Davidson, of Trafford Park, to representatives of the Manchester and South-East Lancashire Corporations last month. The Manchester Corporation employs three main types of motor-bus—Leyland, Crossley and A.E.C.

New Transport Depôt.—Salford Corporation has opened a new transport department for motor-buses and tramcars at Weaste. The cost of the building is about £80,000. The Corporation motor-bus fleet of 72 vehicles is to be supplemented shortly by 18 'buses of the most up-to-date type, tenders for which were recently invited. Omnibus routes operated under the Acts of 1920 and 1927 cover approximately 150 miles of route, 46 miles of which are within the Corporation area and the remainder on joint services or inter-running extensions which link up with the services of the Lancashire United Transport and Power Company, and the Leigh, Wigan and Bolton Corporations on the western boundary of the city, and with the Bury, Manchester and Stockport services on the northern and eastern boundaries.

Manchester Tube Plan.—An £11,000,000 scheme for the construction of tube railways in Manchester will be submitted to the January meeting of the Manchester City Council. It is estimated that the tube will take nine or ten years to complete and will cost £669,000 per mile to construct.

Transport Clauses in Corporation Bill.—Considerations of space will only permit of very brief reference to the clauses in the Manchester Corporation Bill which concern road users. Apart from the powers that are being sought to make and maintain and carry out certain road works, the Corporation seek to provide and maintain motorbus services beyond the City of Manchester for the carriage of passengers, goods and luggage, and to enter into working agreements with other local authorities, companies and persons. Clause 11, if adopted, will enable them to discontinue tramways and to substitute trolley vehicles and omnibuses therefor. Steam vehicle owners will be interested in the fact that powers are being solicited to make provision for preventing nuisances by smoke or otherwise from mechanically propelled vehicles; proprietors of hackney carriages and motorbuses may be required to insure against third party risks; the Corporation may prescribe the starting and stopping places for motorbuses and may make further provision for the regulation of vehicles at tramway stopping places.

Trailer Law.—When Messrs. David Riley & Co. were summoned at Middleton for allowing a trailer with incorrect axle weights to be used, it was argued that the Act bearing on this was to the effect that no load on a lorry and trailer should exceed 22 tons. There were no registered axle weights for a trailer. As the load had not been weighed by the police it was submitted that there was no case, as the only thing they could prosecute for was an excessive weight on the trailer. The case was dismissed.

Yorkshire Notes.

FROM OUR OWN CORRESPONDENT.

Parliamentary Activity.—A number of Parliamentary Bills of interest to transport users in Yorkshire are to be presented to Parliament during the coming session. The Leeds Corporation is to seek powers to extend the tramway system and to run omnibuses along any route outside the city (subject to such consents as may be prescribed in the Bill), and to enable the Corporation and any other corporation, authority, company, body or person to enter into contracts or agreements with regard to the running of motor omnibuses. Another interesting clause is to give the Corporation power to provide a penalty for failure to observe a signal or light controlling traffic. The Barnsley and District Traction Company will also seek to abandon certain tramway routes and to substitute motor omnibuses. A curious position has arisen in regard to a Bill in which it is sought to give Parliamentary sanction to an arrangement between four Urban Councils operating the Dearne District Light Railway and the Yorkshire Electric Traction Company. It is desired to abandon certain tramways and substitute trackless services, but at the present time the matter is in abeyance as by one vote one of the Councils concerned has failed to give its approval to the Bill and absolute unanimity must be shown before the Bill can be introduced in Parliament.

A Bradford Conversion.—Bradford has introduced railless on a route from the city to Allerton in place of tramcars, although trams still run over a big section of the route to serve another suburb. The change over has been the subject of much controversy, and while the Tramway Committee appeared to support railless there was a very strong feeling that motor omnibuses should be introduced to take the place of the trams. The tramway officials contended that there was not sufficient traffic to justify relaying of the tramway track, which was worn out. Other sections of tramway in Bradford are reaching the stage when they will have to be relaid, and it will be interesting to watch developments during the coming year. In addition motor-bus competition with tramways is severely affecting the tramway finances, and the Tramway Manager recently complained that motor-buses were "shadowing" the tramcars and taking the cream of the traffic.

Noise Regulations Enforced.—The noise regulations are being enforced in Yorkshire, a notable case being one at the Halifax West Riding Court in which a local motor-bus proprietor was fined £1 for permitting a motor-bus to make an excessive noise. The case against the driver was dismissed on payment of the costs. The mudguard was loose, and, in the words of the police officer, "an excessive noise was being made."

Difficulties of the Weather.—Weather conditions during the winter months have been in distinct contrast with that of the summer, when everybody got the advantage of ideal conditions. Floods have interfered with some of the bridge improvements which are going on in various parts of the county, but fortunately there are few main highways which become flooded and stop traffic. Fog has been a great bugbear to the transport industry, and particularly to the motor-bus operators. Services have been disorganised on many occasions, and the difficulty has often been that the fog has been thick in some places and comparatively light in other places. Drivers have had no warning when they might run into a bank of fog, and conditions have been more dangerous than for many years past.

An Unfair Insinuation.—Reference was made in these notes recently to the statements made in various quarters that motor omnibus employees engaged with private firms were being paid very inadequate wages. The Silsden Urban Council received a letter asking them not to licence vehicles running in their district unless an undertaking was given that fair wages were paid. Inquiries were made and it was found that there was no ground for complaint.

Traffic Links Developing.—The opening of the Boothferry Bridge to provide a link between the West and East Riding of Yorkshire is proving to be so popular and useful that thoughts are being turned to similar developments in other quarters. For a long time the existence of toll-bridges has been a serious matter in this low-lying part and a new method of dealing with the problem has suggested itself in certain quarters, it being proposed in one case to build an entirely new bridge if terms cannot be arranged with the toll-bridge owners. The idea of providing ring roads and by-passes to many of the old towns where traffic congestion is very troublesome is receiving attention, and at York a local inquiry has been held to authorise the planning of a road which will enable traffic to miss the city. To the transport industry such roads are of great capital value in the saving of time and expediting traffic.

Hull Notes.

FROM OUR OWN CORRESPONDENT.

Tunnel or Bridge?—The cordial way in which the Lord Privy Seal received the deputation which waited upon him to ask for Government support in the matter of providing better means of communication between Hull and North Lincolnshire has given rise to a confident feeling that the construction of either a tunnel or a bridge will be commenced in the not-distant future. Expert engineers are preparing alternate schemes. In the meantime the Humber Conservancy Board, who are particularly concerned in seeing that nothing is done to prejudice navigation of the Humber, have let it be known that they are strongly opposed to the idea of a bridge. So far as they are concerned, it must be a tunnel, and in that attitude they have the support of the vast majority of people qualified to express an opinion.

A Request Refused.—The Hull Omnibus Owners' Association asked the Watch and Licensing Committee to receive a deputation to discuss with them the question of the additional vehicles to be used by the Corporation when the extension of the City boundaries comes into operation, but the request was turned down, the Committee considering no useful purpose would be served by it.

Safety First.—Hull Watch Committee is taking the initiative in the establishment of a local branch of the Safety First Association. They are to co-operate with the members of such organisations as may be thought desirable.

Knock-for-Knock Agreement.—East Yorkshire Motor 'Bus Services, Ltd., have concluded a knock-for-knock agreement with the Hull Corporation Tramways undertaking.

Upholstering of Tramcars.—As an experiment two tramcars are to be upholstered at an estimated cost of £130 each. Heating is also to be supplied.

Tenders Accepted.—The Tramways Committee have accepted the following tenders for trolley 'buses: Guy Motors Ltd., 12 chassis complete at £1,165 each; Brush Electrical Engineering Company Ltd., six 'bus bodies at £800 each; and Messrs. C. H. Roe Ltd., six 'bus bodies at £825 each. The vehicles are to be used on the New Bridge-road route.

Abolition of Level Crossings.—The consummation of the wishes of the entire public that Hull should be freed from the stranglehold of the level crossings seems to be on the point of achievement. The Consulting Engineers, Sir Henry Maybury and Mr. Fredk. Palmer, whom the Corporation engaged, have reported in favour of the scheme prepared by the engineers of the London and North Eastern Railway Co. Indeed, they go so far as to say that a better one could not be evolved. The Bill to give legal sanction and authority to the agreement between the Corporation and the railway company will shortly be placed before Parliament. Already it has obtained the blessing of the Lord Privy Seal, and its speedy passage into law is regarded as a foregone conclusion. The total estimated cost of the scheme is £1,242,249, and the London and North Eastern Railway Company will contribute the sum of £100,000. For the remainder the Corporation is to be responsible, but they hope to get considerable assistance from the Ministry of Transport and the Unemployment Grants Committee. As the tramways will benefit considerably by uninterrupted running, they are to contribute £10,000 a year towards the cost, and in order that present-day ratepayers may be relieved somewhat, and posterity pay its share for the advantages it will receive, the Corporation are asking for the repayment of the loan they will have to raise to be spread over a period of eighty instead of thirty years. Five years are allowed for the completion of the work after the passing of the Act.

Another Exide Polar Triumph.—Exide batteries have borne an important part in many accomplishments of world significance. Their latest achievement of international interest is the enabling of Commander Byrd to keep in constant touch with civilisation throughout his South Pole expedition. Commander Byrd is now receiving universal congratulations as being the first man to fly over both Poles, and throughout his Antarctic expedition he used Exide batteries exclusively for his radio power, and for other vital services for which an absolutely reliable supply of electric current is required. It may be recalled that Exide batteries were also used in the airship "Norge," which Captain Amundsen successfully navigated from Spitzbergen across the North Pole to Alaska in 1926. The present British Antarctic Expedition under Sir Douglas Mawson in the "Discovery" is also equipped with Exide batteries.

South Wales Notes.

FROM OUR OWN CORRESPONDENT.

Important Ministry Decision.—In the matter of appeals made by Great Western Express Coy., Ltd., and the South Mon. Motors, Ltd., against refusal by the Cardiff City Council of licences for South Wales—London route services, the Ministry in announcing decision in favour of the companies, makes a pronouncement of importance to all long distance bus service proprietors. Whilst stating that licences should be granted the Ministry states that on each long distance service bus an adult conductor must be carried, and the Ministry is to make this a rule. The main objection to bus service conductors on long distance routes was stated at the inquiry into these appeals to be that a seat which could be occupied by a passenger has to be given up to a conductor with resultant loss on some long distance routes of as much as £2 per bus per day. Furthermore, it was argued that conductors were unnecessary on such buses as all seats were pre-booked and there was no picking up and setting down of passengers in the way usual to short distance ply-for-hire services.

More Trams to Go.—The Pontypridd Urban District Council is to immediately scrap a large section of its tramways system and replace the trams by both trolley buses and petrol buses. The Council has been empowered to take this step for some time but has delayed action in the matter. The trams have been a losing concern, mainly, it would seem, owing to the large percentage of workmen's services, at reduced fares, which have to be run in this colliery district.

An Inquiry Pending.—The Ministry of Transport will shortly hold an inquiry into the withdrawal by the Cardiff City Council of six licences from Imperial Motors, Ltd., Abercynon, for alleged breach of running conditions.

Keeping Out Private Enterprise.—A conference of East Glamorgan local authorities, held at the instance of the Cardiff City Council, has decided that all the authorities shall refuse licences for private enterprise services which would have to enter Cardiff by the North Road. As there is no other way of reaching Cardiff from the Rhonddas, Pontypridd, Merthyr, Aberdare and Caerphilly this decision, in effect, amounts to closing entry to Cardiff from these districts to private enterprise services. The same conference decided to allow the Cardiff and Merthyr Councils to ply buses over the North Road into and from Cardiff although the ground of decision to refuse private services licences is that congestion prevails on the North Road. A great ramification of inter-town municipal services in this area is proposed in which several owning councils are concerned.

Licences Granted and Refused.—At the November meeting of the Merthyr Tydfil Watch Committee applications for licences on the route Merthyr—Cardiff were received from C. Davies & Sons, Dowlais, Imperial Motor Coy., Abercynon, Gough's Motors, Mountain Ash, Mardy, Rhondda, Motor Coy., Ltd., Mardy, Rhondda, and Mr. J. King, of Pontypridd. All these applications were refused as have been several applications from other firms in previous months. At the same meeting licences were granted for the route to the Cardiff City Council who, in turn, will licence Merthyr Council services. Some of the companies who have been refused licences for the route have been refused year after year and feel that injustice has been done in refusal of their prior claims to the route whilst granting the first application from Cardiff municipal service.

G.W.R. Extensions in Monmouthshire. — The Great Western Railway Company is to extend its bus services depôt at Abergavenny and is, it is stated, to make Abergavenny an important centre for bus services in North Monmouthshire and Breconshire areas.

Bus Powers Bills.—Bills now being put forward to Parliament for extended powers of bus running include those of the Cardiff and Newport Councils who seek large additional plying powers. Cardiff also seeks power to compulsorily purchase the toll gate on the main Cardiff—Penarth Road—a proposal which will be welcomed by vehicle owners. The Llanelly Traction Coy. seeks power to substitute trolley buses for trams at Llanelly.

Obituary.—The death of Mr. A. Jones, the Southampton manager of Jay's Ltd., was keenly felt by furniture removers in South Wales. He had been formerly manager at Swansea and Pontypridd and had been a large number of years in the trade and prominent in removers' organisation. The South Wales centre of the Furniture Warehousemen and Removers' Association were represented at the interment at Swansea and also sent wreaths from the branch and individual members.

North-East Coast Notes.

FROM OUR OWN CORRESPONDENT.

"Scrap the Trams."—It has been suggested by correspondents in the Newcastle Press that the City trams should be "scrapped" in 12 months and replaced by buses. The Northumberland and Durham Property Owners' and Ratepayers' Associations, having examined the accounts of the Corporation Transport Committee, states, decisively, that the proposition is not economically sound and that the trams should soon be making an increased profit.

Tyneside Tramways.—As a result of the passing of the Tyneside Tramways and Tramroads Company's Bill, the Company will, when expedient and practical, abandon its tramways and substitute a system of modern motor buses. In this, as far as the through route from Newcastle to Tynemouth and North Shields is concerned, they will be associated with the Newcastle Corporation. The Company's tramways within Newcastle and Gosforth become part of that Corporation's system. When the tram track elsewhere is no longer operated, Wallsend Corporation will restore the road at the Company's expense. They have the rights of purchase in 1959, provided they take the whole undertaking.

Garage De-rated.—Mr. G. L. Jackson, of the Bridge End Garage, Morpeth, was respondent before the Rate Assessment Committee at Newcastle in a claim by the Revenue authorities to have his premises scheduled as a non-industrial establishment and liable to non-preferential rating. He put in the claim that the primary use of the premises was that of an engineers' and millwrights' shop. Figures were given to prove that whereas the profits from retail business, including petrol-supply, were £372 up to October 31st last, the profits from engineering and repairing were £1,059. The firm's claim was sustained.

Bus v. Rail.—The question of traffic service in the North-East area is said to be under serious consideration by the L.N.E.R., in view of the fact that it has recently acquired a controlling interest in many motor bus services. Where passenger traffic has left the railway in large volume it might obviously be economy to close some of the stations, or discontinue Sunday services in connection therewith, but nothing definite has been announced.

New-Style "Robot."—One of the new super automatic traffic signals, as recommended by a national commission on motoring, was recently installed near the Newcastle end of the Tyne Bridge, an especially busy spot. Instead of only amber showing for caution, the red and amber signals show together until the all-clear green is seen. To put an end to the practice of some drivers starting on the "caution" signal, the authorities have been experimenting with a direct "stop" to "go" system.

Great North Road.—A scheme for the improvement of the Great North Road in Northumberland has been approved by the County Council, the total estimated cost being £306,000. The Ministry of Transport will give a grant of 85 per cent., leaving £45,000 to be borne by the rates. Under the Government's terms, labour must be recruited from the county, those engaged being married men or men with dependents.

A "Rush" Job.—One of the biggest permanent way alterations in the North within recent years was when four new main line electric tracks were laid on the L.N.E.R. at Newcastle. The work was necessitated by the reconstruction and widening of the arch over the Tyne Bridge approach at the foot of Pilgrim Street, and was carried out one Sunday without any delay to trains.

Traffic Control.—The Transport Bill, when it becomes operative, will means wholesale reorganisation of licensing and other authorities in the various regions. Anticipating this, a North-East Regional Committee was formed, and promptly set about its task of regulating inter-district traffic, linking up bus services, etc., etc.

Passimeter Booking Office.—The first passimeter booking and ticket collecting office in the North of England was opened by the L.N.E.R. on November 25th at Manors East Station, Newcastle. Over 100,000 tickets are issued and over 200,000 collected at Manors End annually.

A New Fleet.—A considerable number of double-deck motor buses have been acquired by United Automobile Services, Ltd., for its Newcastle-Ashington and other services.

Posting Boxes on Buses.—Posting boxes are now available on the "United" buses to and from Newcastle on the Blyth, Thropton and Newbiggin routes. The boxes are intended for letters and postcards only, and the scheme is experimental. Similar services are about to be introduced on the Newcastle trams.

Midland Notes.

FROM OUR OWN CORRESPONDENT.

Birmingham City Bus Developments. — In view of the development of omnibus services the Birmingham Corporation is ordering 75 new double-deck buses. Some of these buses will take the place of the Hagley Road trams which are being scrapped at the end of the year; sixteen will be used on a new route and about twenty on existing routes. Twenty new single-deckers, recently purchased, are now in service.

G.W.R. Activity.—Improvements costing in the neighbourhood of a quarter of a million are to be undertaken by the Great Western Railway at Wolverhampton. The scheme includes the reconstruction and modernising of locomotive repair shops; the construction of a new engine erecting shop; a machine and building shop; four new cranes to be installed; the reconstruction of the goods depot, in Herbert Street, equipped with the latest electrical appliances. The Solihull District Council report that the Great Western Railway have submitted proposals for quadrupling its running lines between Olton and Rowington, a distance of several miles on the North Warwickshire line. This will mean considerable bridge alterations.

G.W.R. Cartage Scheme.—The Great Western Railway has inaugurated a new house-to-house cartage scheme for goods and parcels in certain large centres, including Birmingham and Wolverhampton.

Railway Orders.—Rhodesian Railways have ordered 150 steel wagons and 150 bogie 45-ton capacity wagons from the Metropolitan Cammell Carriage Wagon and Finance Co., Ltd.; 100 20-ton wagons from the Birmingham Railway Carriage and Wagon Co., Ltd., and six first-class passenger coaches from the Gloucester Railway Carriage and Wagon Co., Ltd.

Buses Replace Trams.—Omnibuses have superseded the trams on the Bromford Lane route from West Bromwich to Oldbury, and on the Spon Lane route from West Bromwich to Smethwick. The service, inaugurated by the West Bromwich Corporation, works successfully.

Negotiations at Stoke-on-Trent. — The Special Committee, set up recently by the Stoke Corporation in connection with proposals to promote a Bill in Parliament for powers to operate bus services, met a deputation of the North Staffordshire Bus Proprietors. It is believed that a basis for settlement has been arrived at but as yet details have not been disclosed.

"Safety First" Awards.—The Birmingham Co-operative Society is a great supporter of the "Safety First" movement and have added money prizes to their drivers receiving awards from the "Safety First" Council.

Midland "Red."—Mr. O. Cecil Power, Traffic Manager, The Birmingham and Midland Motor Omnibus Co., Ltd., said, in an address to the Birmingham Rotarians, lately, that the Midland "Red" motor services would continue to develop on existing lines. The public would benefit materially by the close working of road and rail services. Waste of transport facilities would be avoided, buses would meet early and late trains, there would be synchronisation of time-tables, the use by buses of railway station yards, and the issue of combined road and rail tickets. Mr. Power added that the Company were building 200 super motor coaches for long distance services next year.

By Road to the Mersey.—An attempt to revive interest in a motorway between Birmingham, Manchester and Liverpool was discussed at a recent meeting of the Midland branch of the Roads Improvement Association. Mr. S. P. Blizzard explained that to construct such a road 123 miles long would cost £7,000,000 and suggested that if the State was not prepared to spend such a sum there should be no objection to private enterprise undertaking the work on the basis of tolls. Transport between the Midlands and the Mersey and the Manchester Ship Canal was increasing at the rate of 20 per cent. per annum. The idea of tolls was not well received. Mr. Thos. Hawkins, J.P., of the Birmingham Horse and Vehicle Owners' Association expressed the view that the Midlands would be better served by spending half the money on existing roads. Nevertheless, both the Birmingham City Council and the Chamber of Commerce have passed resolutions favouring a toll road constructed by private enterprise.

Importance of Canals to the Midlands. — Mr. George Cadbury, in a lecture to the Great Western Railway Debating Society the other day, said that waterways were among the essential factors in fixing the cost of transport and were, therefore, a key to the prosperity of the Midlands. Unless Birmingham could obtain cheap transport, he asserted, Birmingham would go to the wall.

Scottish Notes.

FROM OUR OWN CORRESPONDENT.

Trade Outlook.—Industries in the West of Scotland are experiencing a dull period. Most firms will be glad to see the end of the year in the hope that the immediate future holds something better in store. Not a little of the unemployment is due to the closing up of local factories which now operate from England. This is a tendency in industrial life which will continue. The Scottish Motor Show was held last month, but there was no section devoted to commercial vehicles.

Martinmas Term.—At one time an important day for removal contractors in the towns, the Martinmas half-yearly term is losing its character. Tenants now flit from month to month. To some extent several country firms were busier than usual, and motor vans were to be seen conveying furniture and household goods. A few removals are still carried out by horse-drawn vehicles.

Bus Fares Increased.—Buses serving the Lanarkshire routes to and from Glasgow increased the fares last month by approximately 50 per cent. Since the higher tax on petrol came into force no increase has been passed on to the travelling public, and the companies concerned were compelled to adjust the fares. The railway benefited, and during the first week a big improvement in the volume of passenger traffic was reported. Weekly zone tickets were taken out, and the trams on the routes also did more business.

Tourist Traffic.—Sir Josiah Stamp, the President of the L.M. & S. Railway, spoke at the annual gathering of the natives of Tiree in Glasgow. He said that when Coast Lines and the L.M.S. Railway Company arranged with the Government to take over the old and famous MacBrayne service they did it in no light spirit of adventure. They knew the economic difficulties, and at the same time they felt that here was a part of the British Isles in which public spirit should not be wanting. The new company was doing its part and new steamers had been introduced. Other projects were being considered. In the western isles of Scotland there were possibilities of exploitation, as tourist resorts, said Sir Josiah.

India Tyre and Rubber Co.—In connection with the Scottish Motor Show, a number of traders were invited to a dinner given by the directors of the India Tyre & Rubber Co. (Great Britain), Ltd. Mr. A. M. Melville, the managing director, in the course of an interesting speech, said that there were over 200,000 "India" tyres on the road, and they expected, when extensions were completed at their works, that they would not be long till they had a million running on the road. He asked for the support of the motor trade to their company, which had started a work in the West of Scotland that gave employment to over 600 men.

Aberdeen Presentation.—Many business interests in the Aberdeen district were represented at a gathering held in the Douglas Hotel in honour of Mr. Thomas Murray, assistant manager of Messrs. Wordie & Co., who has been promoted to the managership of the Edinburgh and Leith district of his firm. A handsome grandmother clock was presented to Mr. Murray by Mr. James M. Smith, the district traffic superintendent of the L.M.S. Company, on behalf of the various traders and friends who had been associated with him in his work in Aberdeen.

Gourock Buses.—The L.M. & S. Railway Company have acquired an interest in the Pullman Bus Co., Gourock, which has maintained for several years a regular service between Gourock—Glasgow and Gourock—Largs. It was one of the first firms to operate a service between Gourock and Glasgow, where there has been very keen competition. Some months ago the L.M.S. inaugurated a bus service between Greenock and Largs and by their latest enterprise they will link up Glasgow with the north Ayrshire coast by road as well as by rail.

Mr. Wm. Sans Unkles.—In the recent municipal election held in Glasgow, one of the candidates was Mr. William Sans Unkles, who has had considerable experience in motor passenger transport as he has been connected with a motor bus service for many years. Although he did not top the poll Mr. Unkles created a good impression, and being still a young man of much energy and acumen he should score a win when he makes a second attempt for municipal honours.

B.A.I.F.R. New Members.—The following firms have been elected to membership of the British Association of International Furniture Removers:—Messrs. Edmund Franzkowiak & Co., Uhlandstr, 83/34 Berlin-Wilmersdorf, and Edmund Franzkowiak & Co. (known as Edmund Franzkowiak & Co., G.M.B.H.), Hohe Bleichen 29, Hamburg 36.

Northern Ireland Notes.

FROM OUR OWN CORRESPONDENT.

Northern Ireland Motor Vehicles and Road Traffic Bill.—The Motor Vehicles and Road Traffic Bill, which has passed the committee stage of the Northern Ireland House of Commons, has led to a difference between the Belfast Corporation and the Government. The Bill sets up a tribunal to deal with the fares and rates of omnibus undertakings in Northern Ireland, and the buses of the Corporation will not be outside its jurisdiction. The Corporation say that their bus fares are already regulated by statute and are subject to stringent conditions requiring the revenue produced to meet the expenditure; and they say that the dual control and responsibility the Bill would create would not be in the public interest. Members of the Corporation who are also members of the local Parliament, sought to have the Bill amended in accordance with Corporation views, but without success, the Minister of Home Affairs, Sir Dawson Bates, stating that he was not prepared to ask the House to take away from the Government the power of controlling traffic all over Northern Ireland. The chairman of the Fares Tribunal will be Sir Lynden Macassey, K.C., who has consented to act without fee or reward. He is an Ulsterman, having been born in Holywood, a small town near Belfast. It was originally intended that he alone should constitute the tribunal, but, yielding to pressure, the Government decided to appoint three members. The other two have not yet, of course, been nominated. The tribunal will have power to fix, alter or amend the passenger fares, and the luggage rates charged on bus routes, and applications may be made to it either by bus operators or by representatives of the public. "It is not in the public interest," said Sir Dawson Bates, moving the second reading of the measure, "that operators should run at uneconomic fares." One clause of the Bill, which aroused considerable opposition from the motoring public, provides that a driver, if charged with manslaughter and found not guilty of that charge, may, alternatively, be found guilty of "driving recklessly or wantonly or at a speed dangerous to the public." In three years only six convictions have been obtained in Northern Ireland in fifty charges of manslaughter, and the Government view is that persons who deserve some punishment are escaping it altogether. The maximum period of imprisonment fixed originally for "reckless driving" was two years, but as a result of the dissatisfaction the clause aroused, the Government reduced the period to six months.

A New Bus Owners' Association for Northern Ireland.—A new association of licensed route bus owners has just been formed for Northern Ireland at a meeting in Belfast. Mr. William Chamberlain, general manager of the Belfast City Tramways, has been invited to become chairman, and Mr. James M'Crea, managing director of the Belfast Omnibus Co., Ltd., has been elected vice-chairman. Mr. James Boyd, Raleigh House, Queen Street, Belfast, is the secretary.

Dunlop Memorial.—The Dunlop Rubber Co. have decided to perpetuate the memory of the inventor of the pneumatic tyre, James Boyd Dunlop, by placing a tablet on the premises in May Street, Belfast, where he practised as a veterinary surgeon. It is understood that Sir Eric Geddes, chairman of the Dunlop Co., will visit Belfast to unveil the tablet. The late Mr. Dunlop made his first pneumatic tyre in Belfast forty-one years ago, and the idea came to him while he was watching his son riding a tricycle in a Belfast park. Mr. Dunlop came to Belfast from Ayrshire early in his life.

Belfast Trams.—During the fortnight ended 29th November, 4,340,430 passengers were carried by the Belfast Corporation trams, an increase of 1,275,440 over the corresponding period last year. Increase in receipts was £6,841, and in mileage 6,320.

Motor Accidents in Northern Ireland.—During the period 1st January to 30th September, 1929, there were 1,071 motor accidents in Northern Ireland; and in the same period of 1928 the number of accidents was 1,115. The decrease of 44 occurred although it was estimated there were 2,000 more motor vehicles on the roads in 1929 than in 1928.

New Union Castle Steamer.—The "Winchester Castle," a 19,500 ton motor-ship, 630 ft. long, launched recently at Harland & Wolff's Belfast shipyard for the Union Castle Company's service between Great Britain and South Africa, has many unique features intended to increase the comfort of passengers, of whom 765 will be carried in three classes. A sister ship, the "Warwick Castle," will be launched next spring. Both vessels will be generally similar to the "Carnarvon Castle," one of the most popular vessels in the Company's service.

Irish Free State Notes.

FROM OUR OWN CORRESPONDENT.

Forthcoming Legislation for the Regulation of Motor Traffic in the Irish Free State.—In Dail Eireann, Mr. Ernest Blythe, Minister for Finance, referring to the forthcoming legislation for the regulation of motor traffic, said that two or three months ago the Executive Council agreed to the heads of a Bill, which were submitted by the Department of Local Government, and the preparation of a Bill on these lines had since gone on. He understood that the Bill was very nearly ready, and if it was not introduced before Christmas, it would be ready soon after the New Year.

An Irish "Safety First" League Established. — At a public meeting held in Dublin under the auspices of the Irish Motorists' Union, on the proposition of Senator A. Byrne, it was decided to establish an Irish "Safety First" League. Mr. O'Keeffe, on behalf of the Irish Bus Owners' Association, said that the League would have the co-operation of their organisation. The objects in view in the formation of the League include the education of the general public as well as drivers of mechanically-propelled vehicles in Ireland to "Safety First" methods, and devise ways and means for ensuring public safety on the roads. Mr. Seamus Murphy, Dublin City Commissioner, who presided at the meeting, said that during the last three or four years there had been an extraordinary increase in vehicular traffic in the Irish Free State, and an alarming increase in the number of accidents. The Irish Motorists' Union was to be congratulated on giving them an opportunity of establishing such a League, and it should be remembered that "safety first" involved unselfishness, good manners and co-operation on the part of all who used roads and footpaths. Mr. J. J. Reddy, a member of the Organising Committee of the Irish Motorists' Union, said that his Union had now projected the "Safety First" League for Ireland, and they believed that much could be accomplished without any drastic legislation by the co-operation of the people with the police and local authorities. The ambition of the League was to see "Safety First" signs placed up in every factory, workshop, showroom, office and public vehicle, so that there may be no excuse for people pleading ignorance. Dr. T. Hennessy, T.D., and General O'Duffy, Chief Commissioner of the Civic Guards, also spoke, and made valuable suggestions for the working of the League.

Collection and Delivery of Goods by Irish Railway's Motor Services.—The Great Northern Railway Company of Ireland are steadily developing their motor traffic in the Irish Free State. The Company has recently undertaken the collection and delivery of goods traffic at several of their stations, as a development of their motor services. For this purpose a number of Leyland and Morris motor lorries were ordered by the Company, who have also decided to increase the number of their buses in the Free State, the bodies of which are to be of Irish manufacture, and the chassis to be of the Leyland Tiger type to be supplied by Messrs. Ashenhurst & Williams, who are agents in Dublin for the Leyland Motor Company. About a score of new and up-to-date buses are being obtained by this progressive Railway Company.

Nine Months' Importations of Commercial Motor Vehicles into the Irish Free State.—From the Irish Free State import returns for the first nine months of the present year it appeared that no less than 842 commercial motor vehicles, of the value of £155,333, were imported into the Free State between 1st January and 30th September last, as compared with 414, of the value of £148,284, imported during the first nine months of 1928. From these figures it could be seen that although more than twice the number of these vehicles were imported this year, compared with 1928, the difference in value was as low as £7,049.

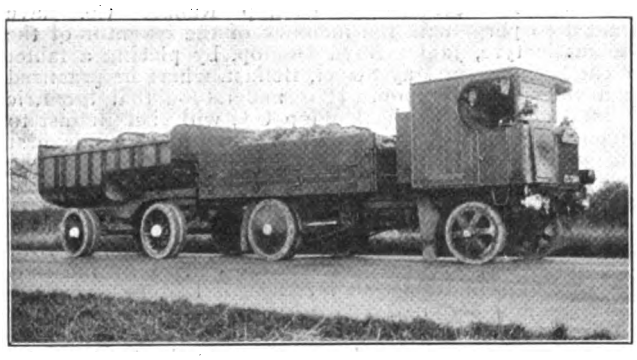
BRITISH BUILT CRUDE OIL WAGONS.

To the Editor of THE WORLD'S CARRIERS.

SIR,—We are sending you herewith photographs of what we believe to be the first British built crude oil wagons to have been put into regular duty in this country. These wagons were made and supplied by Richard Garrett & Sons, Ltd., Leiston, over 12 months ago, to our associated company, Messrs. Barford & Perkins, Ltd., Peterborough. They were



GARRETT CRUDE OIL WAGON IN THE SERVICE OF BARFORD & PERKINS, LTD., PETERBOROUGH.

equipped with experimental crude-oil engines, the 4-wheeler having an engine developing approximately 60 b.h.p., and the 6-wheeler an engine developing approximately 80 b.h.p. The standard "Garrett" 4-wheeler and 6-wheeler steam wagon chassis were used as a basis for these wagons. They were both put into service in November, 1928, since when the 6-wheeler wagon has covered some 16,000 miles, and the 4-wheeler about 12,000, the 6-wheeler having been used principally for long distance running, heavily loaded both ways, and the 4-wheeler for more or less local work. Loads were anything up to 11 tons, and Messrs. Barford & Perkins inform us that the wagons have proved extremely economical in use and very reliable.

Yours faithfully,
AGRICULTURAL & GENERAL ENGINEERS, LTD.,
FRANK E. DADD,
Publicity Manager.

Aldwych House,
Aldwych, London, W.C.2.
November 21st, 1929.

H. G. BURFORD & CO.

To the Editor of THE WORLD'S CARRIERS.

SIR,—Probably you know that H. G. Burford & Co. (1926), Ltd., is in Voluntary Liquidation, but the facts relating thereto appear to be unknown, and consequently a rumour is going round to the effect that the Company has gone "broke," whereas nothing of the kind has happened.

The facts are that the writer, who was managing director and held a large interest in the above mentioned Company, has, after a very successful three years' trading, purchased the goodwill, plant, machinery, tools, stocks on hand, and chassis in construction, and prefers to trade as a private concern instead of a limited liability company, it was, therefore, necessary to wind up the 1926 Company, and certain legal formalities (the appointment of a liquidator, etc.), had to be carried out. The most important point, however, has been overlooked, namely:—*the Company owed no monies whatever at the time of going into liquidation,* and to ensure that no creditors would exist, all deliveries of goods were paid for daily up to September 30th, the date of the change over. The liquidation, therefore, is really of no interest except to the shareholders of the 1926 Company, who are being paid out on a basis very satisfactory to them.

The business will be continued exactly as before except for the change of the title. Contracts from the War Office and Orders on hand are sufficient to keep the works busy until June next year.

With apologies for this lengthy explanation,
Yours faithfully,
C. HY. GRAY.

H. G. Burford & Co.,
London, W.10.
November 25th, 1929.

Law Cases.

ANTI NOISE REGULATIONS.

PROSECUTIONS under the Motor Cars (Excessive Noise) Regulations in the Heywood district took place recently when William Sutcliffe, Hebden Bridge, and Thomas Topping, of Longton, Preston, were summoned.

In Sutcliffe's case, the excessive noise was alleged to have been caused by a loose mudguard and door, and a broken footboard. In Topping's case, the defects were said to be a loose identification plate, loose brake rods, doors and window frames.

As these were the first cases, each of the defendants was fined 7s. 6d.

In a case heard at Bury, it was alleged that a lorry was fitted with three loose iron plates on the lorry bottom. The lorry body was in poor condition, and the plates were covering holes. The owners said the lorry was in good condition, and the plates, which were used to prevent scrap metal which was carried on the lorry, doing damage, must have worked over each other, causing the noise. Defendants were fined 15s.

NEGLIGENCE IF HORSE NOT RESTRAINED AFTER SHYING.

IN the Southwark County Court, before Judge Moore, Alfred Joseph Farino, confectioner and ice-cream vendor, sued Messrs. Matthews & Co., haulage contractors, of 159 Blackfriars Road, S.E., to recover £10 17s. 6d., loss of profit on ice-cream.

The plaintiff said that on the Wednesday prior to Easter, he had his ice-cream barrow in Bethnal Green Road, when the defendant's one-horse van collided with the barrow, so damaging it that it could not be used. He estimated that during Easter week, his takings in ice-cream would have been £25, out of which £10 would have been profit. He also had to hire a barrow for five weeks, which cost him 3s. 6d. a week, making up his claim. At the time of the accident, he alleged the horse and van was approaching him from the opposite direction, and did not strike him from the rear. The defendants in fact repaired the barrow free of charge, but would not meet him on the question of loss of profit during the week he was unable to hire a barrow, as they were all out, being a busy period in the ice-cream trade.

For the defence, the driver of the van said that a piece of paper blew into the horse's face, causing it to shy, and it struck the barrow at the side. The horse was quiet by nature, but was liable to periodical fits, when it had a tendency to lie on its side.

Judge Moore, giving his decision, said that in his opinion, the claim for loss of profit was not unreasonable, in view of the period when plaintiff was unable to work. He considered that there had been negligence on the part of the defendant's driver, in not restraining the horse once it had shied. He would award the plaintiff £10 7s. and costs.

DAMAGE TO NEWSPRINT.

IN the Mayor's and City of London Court, before Judge Shewell Cooper, Mr. S. J. Glover, trading as Perkins & Co., 54 Gravel Lane, Southwark, sued Messrs. Finney Barlow & Co., Ltd., the garage, Cambrian Grove, Gravesend, for £11 15s. 3d. for damage to two rolls of newsprint which the plaintiff was delivering to "The Times" newspaper on March 19th last. The plaintiff's driver said that he was waiting in the morning at the entrance to Playhouse Yard to deliver a load of newsprint rolls, when he saw the defendant's lorry coming out. He was on the opposite side of the road, as he had to wait until the Yard was clear before being able to get the lorry into position to unload. The defendant's vehicle passed between him and his (witness's) lorry, and in consequence, he did not see any collision, but immediately after the defendant's lorry passed, two rolls of newsprint were in the road, and a general unsettlement of the remaining rolls on his lorry occurred. He went to investigate, and found that apparently the aftermost roll had been struck by the defendant's lorry, and the rope holding the rolls in position had been broken.

Evidence was given by Mr. McCarthy, an employee of "The Times" newspaper, that two of the rolls of paper were so badly scarred that they were unusable for newspaper work. For the defence, Mr. G. Woolley, defendant's driver, said that as he was coming out, plaintiff's driver backed his lorry to give him room to get out into Water Lane. As the plaintiff's lorry was moving in that way he (witness) saw one of the rolls shift and fall back into the road. Witness tried to edge his way out without touching the roll referred to. He did not believe that his lorry touched the plaintiff's lorry in any way. Judge Shewell Cooper said that it was simply a question which version he was to believe. He came to the conclusion that the story told by the plaintiff was far more satisfactory and explanatory of the occurrence than that told by the defendant's driver. He believed that the plaintiff's lorry was stationary, and that the damage was caused by the defendant's driver passing too close. He gave judgment for the plaintiff for the amount claimed with costs.

MOTOR COACH LAW.

AT Chepstow Sessions, recently, an interesting point anent street obstruction was raised by advocate defending, Samuel J. Pasker, a Bristol coach driver, who was alleged to have caused a traffic block in High Street, Chepstow, by stopping his coach for ten minutes outside a café while waiting for his passengers to refresh themselves.

Advocate contended that in law no prosecution could be made for such offence if no by-laws were in force in the town which specifically prohibited drivers discharging passengers outside a café and waiting for them.

The magistrates upheld this point of law plea and dismissed the case, commenting, however, that it was desirable that town's authorities should take steps to get such by-laws framed and approved by the Ministries.

* * * *

A case of unusual interest to bus and coach proprietors was heard by a King's Bench Divisional Court before Mr. Justice Branson and Mr. Justice Hawke, when Mr. Ernest E. Snow, bus proprietor, lower High Street, Merthyr Tydfil, applied for a rule calling on the Neath (Glam.) Justices to show cause why their conviction of Mr. Snow for alleged excessive passenger carrying should not be quashed.

Counsel for Mr. Snow said that the case was several times adjourned by the magistrates for the attendance of Mr. Snow, who, however, at the time was unable to attend, and he was ultimately convicted and fined in his absence. The allegation against Mr. Snow was that he carried a greater number of passengers in a bus than the number which the licence stated the bus was authorised to carry, viz., it was alleged that sixteen passengers were carried, whereas the licence stated that the vehicle should only carry fourteen passengers. It was applicant's case, however, that in fact he carried less passengers than he might legally have carried, and that, therefore, the conviction was unsound in law and could not be sustained. Although sixteen people were in the bus, the number was made by eleven adults and five children. As the licence issue authorities accept two child passengers to be equivalent to one adult, for licensing purposes, it was thirteen and a half passengers which was the real number carried. In addition, in view of the ruling of the licensing authorities that two children equalled one adult passenger, it was impossible to ascertain under which section of the Act that the magistrates made the conviction.

Their Lordships granted the rule calling on the Justices to show cause why the conviction should not be quashed.

A DOWNHILL SKID.

A SKID down hill by a petrol lorry belonging to the British Petroleum Co., Ltd., of Britannic House, Moorgate, on December 19th, last year, resulted in a triple collision with a private car owned by Mr. H. Reubenstein, 78 Casenove Road, Stoke Newington, and an omnibus, the property of the London Public Omnibus Co., Ltd., 5 Gordon Square, W.C. The sequel was an action by the latter company against the other two parties, claiming £22 5s. 9d. for damage to the omnibus, heard before Judge Shewell Cooper, in the Mayor's and City of London Court. The case was unusual in that the plaintiffs called as witnesses, both the driver of the petrol lorry, and Mr. Reubenstein, the second defendant. Both agreed that the omnibus was stationary, but the driver of the petrol lorry said Mr. Reubenstein attempted to cut across his path in such a fashion that he (witness) was compelled to jam on his brakes with the result that he skidded and struck the two vehicles. Mr. Reubenstein said that he was going in the opposite direction to the petrol lorry, which was coming down Stamford Hill. It was going at a pace which caused it to skid in an oblique angle, over the granite setts, which were wet and greasy. The lorry ripped off the side of his private car, and turning completely round smashed in the rear of the omnibus. One bystander, called by Mr. Reubenstein, said the lorry was skidding down hill owing to its speed, but another onlooker declared that the skid only commenced when the lorry's brakes were applied owing to the risk of accident caused by Mr. Reubenstein's conduct. Judge Shewell Cooper found that the driver of the petrol lorry was going at an excessive speed in the circumstances, and this caused him to skid on a road which necessitated the greatest precaution. This was not exercised by the driver. Judgment was accordingly given for the plaintiffs against the British Petroleum Co., Ltd., for the amount claimed with costs, and for Mr. Reubenstein against the plaintiffs with costs, such costs to be added to the amount recovered from the responsible defendant.

Digitized by Google

For the plaintiffs, Mr. Percy Pitt, instructed by Mr. J. R. C. Bathurst. For the defendant, Mr. Carter, and for the second defendant, Mr. Paul Bennet, V.C.

COUNSELLING AND PROCURING.

ANOTHER point for argument in the much discussed Railway Passengers Duty Act, 1842, was raised before a King's Bench Divisional Court (the Lord Chief Justice and Justices Swift and Branson), on Thursday, November 14th, when Mr. Gough, a Pontypridd omnibus proprietor, appealed against a decision of the local stipendiary magistrate. He had been convicted for contravention of the act, viz., "aiding, abetting, counselling and procuring" a conductor of one of his buses to permit the overcrowding of his vehicle that was plying for hire between Pontypridd and Aberdare.

Mr. Hutchison appeared for Mr. Gough, while Mr. W. E. P. Dove represented the respondent, Mr. J. L. Rees superintendent of police for Pontypridd.

Mr. Hutchison said the point was, (1) whether there was evidence on which the magistrate was justified in holding that appellant did aid, abet, etc., the conductor to permit overcrowding, and (2) whether, in any circumstances, the appellant could be convicted for the commission of an offence which he was incapable of committing except as a "principal." It appeared that on the day of the alleged offence, the bus, travelling to Pontypridd where there were a number of attractions, was crowded with 42 adults and eight children when its licenced capacity was 26. There was no doubt that the conductor was employed by the appellant, and he was fined 5/- for the offence of permitting the overcrowding. Appellant employed one inspector to supervise his three buses and check the takings. The inspector had previously warned the conductor not to allow the vehicle to be overcrowded.

When appellant heard that the conductor had disobeyed orders, he dismissed him.

The Lord Chief Justice: I suppose appellant took the fares at the end of the day?

Counsel: I think so.

His Lordship: Suppose the employer received an amount of fares that he knew could not have been obtained unless the bus was overcrowded, would he not be aiding and abetting?

Mr. Hutchison: There was no evidence of that in this case. Of course, if the employer knew that the vehicle was overloaded I would have to agree that he was guilty of aiding and abetting, but there was no evidence of that. Rather, it was the other way, because the evidence was that he warned the conductor against overcrowding.

The Lord Chief Justice: Here it would appear as if the magistrate thought your client well knew the offence would be committed, expected it to be done, connived at it, and made arrangements for it to be done.

Counsel: Oh no, the magistrate found that neither appellant nor his inspector was present at the time of the overcrowding and neither of them had knowledge of it. Indeed, the inspector twice warned the conductor against the overcrowding.

His Lordship: That may have been evidence of a little play acting on the appellant's part.

Counsel: The evidence is that the conductor was dismissed when appellant knew of the offence.

His Lordship: That would fit very well in to the acting.

Mr. Hutchison stressed the words of Mr. Justice Shearman in a decided case that a man could not be held to have aided and abetted an offence unless he actively or constructively assisted in the act. It was not enough to show that the person charged allowed a state of affairs to continue in which the offence might be committed.

The Lord Chief Justice: Suppose the bus owner gives his conductor instructions to allow the bus to be overcrowded on every conceivable occasion, can he ride off, simply because it could not be proved that, on a particular route, at a particular time, he was not aware of the commission of the offence?

Counsel repeated that no such allegation could be made against Mr. Gough, who had not even been negligent in the matter.

The Lord Chief Justice pointed out that in the case that Mr. Justice Shearman was trying, that in which he used the words quoted by counsel, there was no charge that the person concerned "counselled and procured" as well as aided and abetted. The question of active participation in the actual offence would not arise in a charge of counselling and procuring, and because it was not necessary, when a man counselled and procured another to commit an offence, for the procurer to be present at the commission of the offence.

Mr. Justice Swift: Your client must have been aware, for the fares he received, that the bus was overcrowded.

Counsel: Not necessarily, because the bus may have been empty part of the distance and overcrowded the remainder. After all, the excess number of passengers was only about 20 and the takings may have exceeded not more than a couple of shillings.

The Lord Chief Justice: I cannot help thinking that the magistrate thought that the warnings given to the conductor really amounted to so much humbug. The owner had already been convicted nine times for similar offences.

Counsel said the magistrate found that appellant had been negligent because he did not give the conductor instructions what to do if people persisted in getting on the bus when it was full.

The Lord Chief Justice: Appellant employed a lad of 18 as conductor, and he was physically incapable of keeping people from the bus when it was crowded.

Mr. W. E. Dove replied in support of the conviction, and the Court dismissed the appeal with costs.

The Lord Chief Justice said the first argument was that because only the driver or guard were named in the Act, nobody else could be penalised for an offence. That was not a good contention, for although the duty of seeing that no overcrowding took place was upon the conductor, there was a duty upon the owner not to aid and abet that offence. There was no difficulty in holding that an aider and abettor could be fined £5.

It was so here—and it is, perhaps, the serious part of the argument—that upon the facts there were no materials from which the learned magistrate could properly come to the conclusion that the appellant was liable. No doubt appellant was not physically present at the time of the commission of the offence, and if he had been charged merely with aiding and abetting, it might well have been said that no offence had been proved. But here the appellant was charged also with counselling and procuring. It had been said that a man could not counsel and procure unless he knew that the offence would be committed and intended that it should be committed and that there was, here, no finding that the appellant knew what was happening or intended that it should be done. In terms, that statement was perfectly correct, but it was plain that the appellant knew perfectly well what would happen unless suitable precautions were taken, and he took none of those precautions. Therefore, he was rightly held to have counselled and procured the conductor to commit the offence. What the appellant did or omitted to do in this case seemed to be just as much a counselling and procuring the commission of an offence as if he called up the conductor at the beginning of the day and in plain terms told him to overload the bus to its fullest capacity. Therefore appellant was rightly convicted.

Justices Swift and Branson concurred.

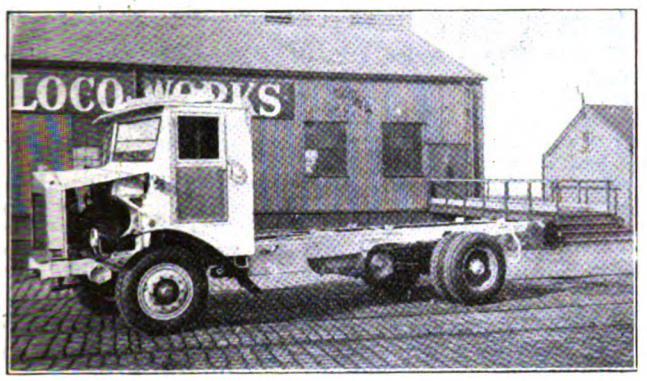
Motor Notes.

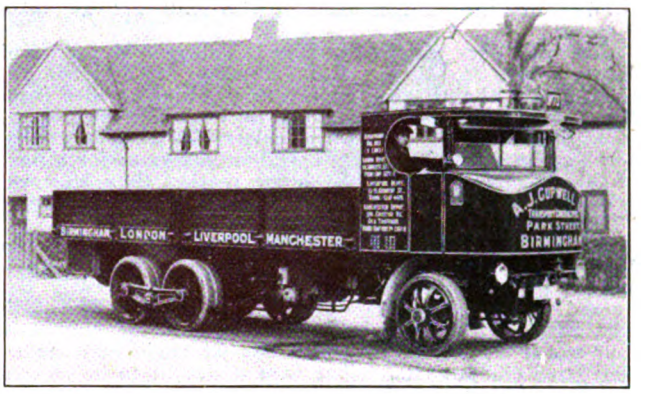
Vulcan Orders.—The Vulcan Motor and Engineering Co. (1906), Ltd., Crossens, Southport, announce that they have received a repeat order from Messrs. Apollinaris for 2½-ton lorries.

The New Kerr Stuart Diesel Chassis.—In our November number we fully described the new Kerr Stuart Diesel engined lorry, but as a photograph of the new vehicle was not available we had to publish one of the original model. We now reproduce the photograph of the new model.



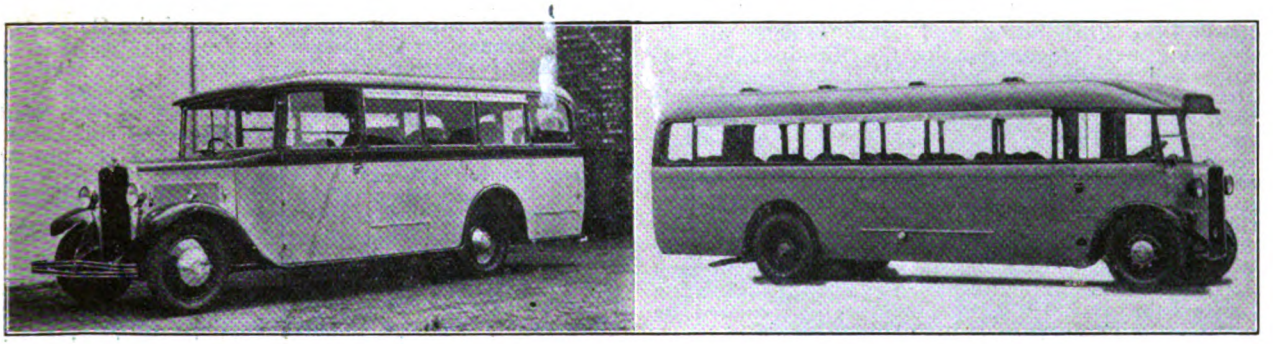
THE KERR STUART DIESEL ENGINED SIX-TON LORRY.

"Sentinel" Sales.—The "Sentinel" Waggon Works, Ltd., Shrewsbury, inform us that they have received recently orders for their well-known double geared rigid frame six-wheeler, the "Sentinel" D.G.6., from the following:—Holroyd & McArthur, Bootle; Cement Marketing Co., Ltd. (2); A. J. Gupwell, Ltd., Birmingham; Chas. Kirby, Hanwell; Swift Transport, Ltd., London; Fred Darby, Sutton, Nr. Ely; Constable Hart & Co., Ltd., Westminster (2); W. Lavender; Roxburgh & Scivier;



THIS SENTINEL D.G. RIGID SIX-WHEELER IS THE FIFTH OF THIS TYPE SUPPLIED TO A. J. GUPWELL, LTD., OF BIRMINGHAM.

Commer Cars at the Show.—Commer Cars, Ltd., Luton, write as follows concerning the interest their vehicles aroused at the recent Commercial Motor Show. "Following the Hillman-Humber-Commer merger, it is not surprising that the new Commers aroused such great interest at the Commercial Vehicle Show, as it had already been announced that this programme was the forerunner of a really serious attack on the world's markets for British commercial vehicle business. All the new chassis have been designed to simplify general maintenance as much as it is possible to do so, and prices have been kept keenly competitive. As you probably know, Messrs. Rootes, Ltd., of Piccadilly, are the sole world exporters of the new Commers. The two vehicles illustrated are the "Invader" for a 20-seater passenger body and the



LEFT: THE COMMER "INVADER" 20-SEATER COACH, AND RIGHT: THE "AVENGER" 32-SEATER COACH.

"Avenger" for a 32 passenger body. The "Invader" chassis incorporates a "silent third" gearbox, smooth and silent running, a six-cylinder engine and Servo four-wheel brakes, together with a very generous equipment. The price is only £495. The "Avenger" is equipped with an extremely powerful and silent six-cylinder engine which develops over 100 h.p. It has servo four-wheel braking and Marles steering. The price is £995.

Brush Bus Bodies.—The Brush Electrical Engineering Co., Ltd., Falcon Works, Loughborough, have issued an excellent little booklet describing bus bodies as manufactured by them, entitled, "Bus Bodies of Distinction." The booklet is excellently illustrated showing details of the construction and seating arrangements of both single and double deck buses. The text fully describes each production.

Concrete Utilities, Ltd., Ware; R. Keetch & Son; F. P. Ford, Winscombe; Tarmac, Ltd. (4); W. J. Harris (Transport), Ltd.; James Brown & Sons, Aighton; T. R. Sanders, Windsor. During this same period the four-wheeled double geared model—the D.G.4.—has also been in good demand, and the following have placed orders for this type, some of which will be fitted with standard and others with tipping bodies:—Wm. Elworthy, Tiverton; J. M. Liddell, Glasgow; Lendrum, Ltd., Manchester; Hugh Winterbottom; J. & J. White, Rutherglen; A. McDougall & Sons, Kilmarnock; Hovis, Ltd., Battersea; Seth Taylor, Dockhead; Noel Bonell, Audlem; T. W. Annable, Shepshed. Orders for the "Super-Sentinel" have been placed by:— The Scottish Speedwell Co., Ltd.; Shotley Bridge Gas Co.; H. Butt & Co., Ltd., Weston-Super-Mare. A large percentage of the above are repeat orders.

Germ Oils.—We have received from Henry Wells Oil Co., Ltd., 11, Haymarket, London, S.W.1, an ingenious distance map consisting of a celluloid cover on which there is a map of England, Wales and Scotland showing all the principle towns. Against each town there is a perforation and there is also an index perforation. Inside the cover is a card with columns of mileages. If the distance is required from any town, say, for instance, between Aberdeen and Birmingham, the card is moved until Birmingham is shown in the index perforation and in the Aberdeen perforation there appears the mileage between those two points, and also in the rest of the perforations the distances between Birmingham and all the

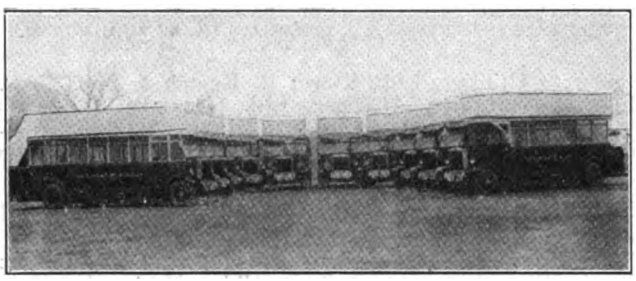
Digitized by Google

principle towns within the United Kingdom. These mileages are accurate, but as the Henry Wells Oil Co., Ltd., inform us, if "Germ Oils" are used the mileages are much shorter!

Vandervell's New Garage.—F. & P. Vandervell, Ltd., of 215, Haverstock Hill, Hampstead, London, N.W., announce that they have acquired new property at Haverstock Hill next door to the Town Hall. There it is their intention to erect a thoroughly up-to-date garage, having a very large number of entrances, lock-ups, workshops, showrooms, a car laundry with high pressure washers, dressing rooms, chauffeurs' rooms and a petrol filling station of artistic design. In the layout of the latter the needs of both private and commercial drivers have been considered, the pumps being widely distributed and the gangways are of ample width on both sides of the pumps. Associated with Messrs. Frank and Percy Vandervell is Captain Robert O'Neill Butler, recently retired from the Indian Army, who will act as sales director.

Vulcans for Australia.—The Vulcan Motor and Engineering Co. (1906), Ltd., Crossens, Southport, announce that they have been favoured with an order from the Australian Government for a fleet of 30/40-cwt. semi-forward drive light rigid six-wheelers, and also they have received an order from an Australian customer for a fleet of 30-cwt. chassis. In the home market they have received an order from the Gloucester Corporation for "Duchess" 26-seater buses.

Guy "Invincible" Buses.—Our photograph shows a fleet of 10 Guy "Invincible" buses which Guy Motors, Ltd., Fallings Park, Wolverhampton, have recently delivered to the Cheltenham & District Traction Co., Ltd. The basis of this "Invincible" vehicle is the Guy new four-wheel double deck bus chassis which is built up of well tried components. The firm wishes it to be clearly understand that the chassis in no way replaces the six-



THE 10 GUY "INVINCIBLE" BUSES REFERRED TO IN TEXT.

wheel double deck bus chassis because there is a definite and increasing demand for both types of chassis. The firm is also supplying a fleet of these chassis to the Newcastle-on-Tyne Corporation, and other vehicles are already being put into service by the Birmingham Corporation and by the East Surrey Traction Company.

Citroen Commercial Vehicles.—Citroen Cars, Ltd., Citroen Building, Brook Green, London, W.6, are marketing a very useful 35-cwt. chassis at £265. The Citroen car is well known throughout the world for its excellent performance, and therefore production of a new commercial chassis is an important matter in the transport world. It has a six-cylinder engine 72 m.m. bore by 100 m.m. stroke developing 45 b.h.p. It has Delco-Remy ignition with automatic advance and retard, aluminium pistons, a four bearing crankshaft, forced feed lubrication and detachable cylinder head. Water is circulated by pump and the carburetter is a Solex. Power is transmitted through a single dry plate clutch to a four speed gearbox (unit with the engine) and from thence by open propeller shaft with Spicer universal joints to the spiral bevel driven rear axle. Mechanical Duo-Servo brakes act on all four wheels. The hand brake acts on the transmission. The wheelbase is 10 ft. 11 in; track 4 ft. 9 in. front and 4 ft. 9¾ in. rear. This chassis is sold fitted with a drop side lorry body at £310, or with van body, £335.

Garrett Success at the Show.—The following is an extract from a letter from Richard Garrett & Sons, Ltd., Aldwych House, Aldwych, London, W.C.2, well known steam wagon manufacturers, to the Secretary of the Society of Motor Manufacturers and Traders, Ltd., concerning the firm's success at the recent Commercial Motor Show:—"Our own results were phenomenal. Apart from casual sightseers, over 1,200 really interested people visited our stand, nearly 200 actual enquiries for "Garrett" 6-wheeler steam wagons were received, and our actual sales exceeded the sum total of all previous Commercial Motor Shows together. As a direct and encouraging result of this year's Show we have decided to double our production programme. Although there were at times as many as ten directors and sales representatives of this firm on the stand, they had considerable difficulty in coping with the amount of interest shown. The demand for our new catalogue exceeded all anticipations."

SKF Ball and Roller Bearings.—The Skefko Ball Bearing Co., Ltd., Luton, have sent us a copy of a booklet they have recently issued dealing with SKF taper roller bearing hubs and axles for trailers, etc. The firm states that there are many features connected with the design, construction and material which they consider place their axles much ahead of other types, for haulage vehicles. They also state that considerable success has attended their introduction on the Continent, and they send us a copy of their quarterly publication, "The Ball Bearing Journal," in which an article appears dealing with tests which have been conducted.

Trailer Wagon Axles, etc.—R. Disturnal & Co., Bridge Works, Wednesbury, Staffs., have sent us an excellent catalogue illustrating and describing the components they manufacture, such as wheels, axles, springs, and complete fittings of all descriptions for trailer wagons. Copies may be had on application to the firm.

Vacuum Oil Company's "Commers."—Our illustration shows a 2½ GN type Commer chassis, being one of two recently delivered to the Vacuum Oil Company. The side of the tilt-van body provides an excellent position for advertisement. Commer Cars inform us that the

ONE OF TWO 2½-TON G.N. TYPE COMMER TILT VAN VEHICLES RECENTLY DELIVERED TO THE VACUUM OIL CO.

Vacuum Oil Company has standardised on these "Commers" for all 2½ tonners they require.

Bowmaker, Ltd.—During the course of the Commercial Motor Transport Exhibition at Olympia, we had the pleasure of meeting Mr. Percy Butler, now Managing Director of Bowmaker, Ltd. It will be remembered that Mr. Butler was General Manager of the Motor Union Insurance Co., Ltd., for many years, and took up his appointment quite recently with his new company, whose London address is Radnor House, 93/97, Regent Street, W.1, and whose Head Offices are at Lloyd's Bank Chambers, 45/47, Old Christchurch Road, Bournemouth. We also had the pleasure of meeting again Mr. Ernest Garton, whom we have known for a long time and who has been in the motor trade for over 22 years. He is now Manager of Bowmaker, Ltd., at Bournemouth, and his firm are doing a large business in connection with financing the sale of motors of all kinds. Other branches of the Company are as follows:—Manchester (Mr. A. E. Todd Webb), Birmingham (Mr. Allen) and Nottingham (Mr. H. H. Parker).

The Ferodo Manual.—Few publications claim the interest of garage proprietors and commercial vehicle fleet owners to a greater extent than the recently published "Ferodo Manual." After inspecting this comprehensive manual we can truthfully class it as unique in its scope, a veritable text-book on the subject of brake and clutch linings. Bearing such a name as "Ferodo," one expects valuable information, and it is obvious that the vast experience behind the manufacture of these brake and clutch linings is the foundation of the success of this book. It contains detailed lists showing the sizes of brake and clutch linings used on practically every make of commercial vehicle and touring car built by British manufacturers during the past six years. American and Continental vehicles are also dealt with, whilst in addition

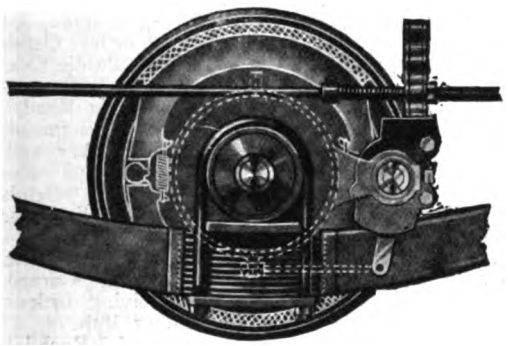
Digitized by Google

list prices are given. We would recommend commercial vehicle owners to secure copies. Applications should be made on a business heading to Ferodo, Limited, Chapel-en-le-Frith, via Stockport.

"Blo-it-Hot."—This self-blowing gas blow pipe, sold under the name "Blo-it-Hot," is placed on the market by Mr. E. E. Boardman, 1, Grange Road, Ealing, London, W.5, who is the patentee and manufacturer. In drawing our attention to this automatic blower, Mr. Boardman informs us that it has been in constant use in his works for forging, brazing, tinning, soldering, re-metalling, casehardening, annealing, toolmaking, pipe bending, rivetting, sheet metal work, metal spinning, straightening various parts of cars, removing broken taps and drills, thawing pipes and paint burning. He further states that the proof of its satisfactory behaviour is in the fact that it is supplied to the following users who have given repeat orders:—The British Army Ordnance, London Underground Railways, Messrs. Rolls Royce, Messrs. Dick Kerr, Messrs. Alfred Herberts, the Oxfordshire Technical Committee, the Ealing Technical Schools, and the Edinburgh Transport Authorities.

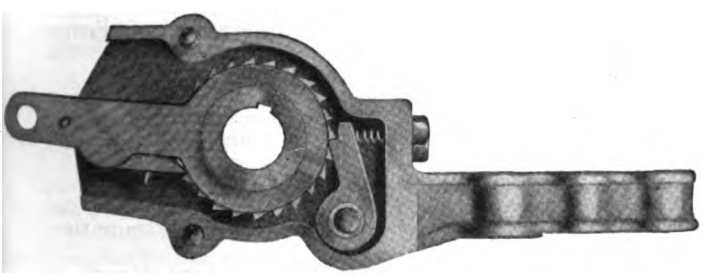
THE "BLO-IT-HOT" SELF-BLOWING BLOWPIPE.

The Safety Brake Regulator.—Brown Bros., Ltd., Great Eastern Street, London, E.C.2, have sent us particulars of the Safety Brake Regulator, which is claimed to provide automatic adjustments of brakes, consequently providing greater safety and security at all times. It is provided to fit all makes of cars, but the accompanying



SHOWING THE ASSEMBLY OF THE SAFETY BRAKE REGULATOR.

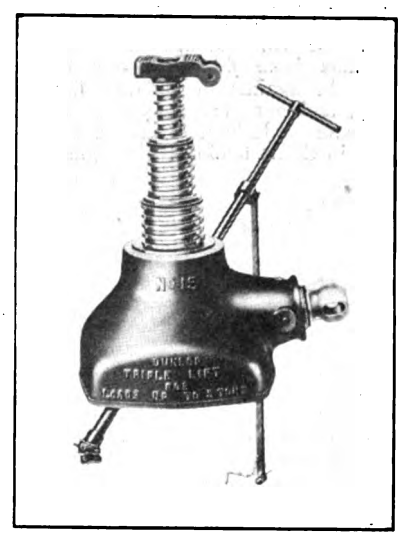
illustration refers to the Morris Oxford model. The orthodox brake lever is removed from the brake camshaft and in its place a lever, which is also a casing for the whole mechanism, is affixed thereto. The lever is pivotally mounted on a spigot on boss which is integral with and forms the centre of the ratchet wheel which is keyed to the brake camshaft, the existing key being utilised. To make contact between the lever and the ratchet a pawl is pivotally mounted on a pin and pressed into position between the teeth of the ratchet by a spring,



THE SAFETY BRAKE REGULATOR. SEE POSITION IN ABOVE ILLUSTRATION.

To make a positive check upon the ratchet when moving in the "off" direction a bracket is pivotally suspended from the spigot. The other end of the bracket is secured in one position by an arm which in turn passes through a cramp which is secured to the back axle casing. The arm is made adjustable for convenience of fixing. On the bracket is pivotally mounted a spring loaded pawl which governs the travel of the ratchet when moving in the "off" direction. As wear of the brake occurs the lever will move the ratchet so that a tooth will be taken up by the pawl and the arc that the end of the pawl must make when riding over the point of and down into the bottom of the tooth leaves a gap which allows the ratchet to travel the distance of the gap and no further in the "off" direction, which gives the necessary clearance between the brake shoes and brake drum which can never become excessive. These movements occur only a few times until the brake linings are worn out, so very little wear takes places on the mechanism but throughout a constant clearance is maintained.

New Dunlop Accessories.—Two new jacks have been added to their existing range by the Dunlop Rubber Company. One is a 2-ton and the other a 5-ton triple lift type and it is claimed that they cover the needs of every commercial vehicle on the road. There is also the Dunlop Trolley Compressor for garage use, which includes a patent pressure testing device that enables the pressure to be taken without removing the pump connector from the tyre valve. A trigger on the chassis enables the handle to be locked in position so that the pump may be wheeled about easily.



THE DUNLOP 5-TON TRIPLE LIFT JACK.

"Bristol" Chassis.—The County Borough of Rotherham, who already operate a fleet of 39 "Bristol" omnibuses, have recently placed an order with the Bristol Tramways & Carriage Co., Ltd., for "Bristol" 4-cylinder, 4-wheel light passenger chassis. The Stockton Corporation have ordered two "Bristol" 26-seater one-man-operated omnibuses, mounted on the "Bristol" type "B" 4-cylinder light passenger chassis. A repeat order has been received from the Glico Petroleum Co., Ltd., for "Bristol" 40 h.p. 4 ton goods chassis.

Winwood Bodywork.—We illustrate a 30-cwt. Chevrolet which has been put into service recently by Frederick Winwood, Ltd., the well-known body builders and furniture removers, of Lowesmoor, Worcester. The body shown in the picture, built by Messrs. Winwood, is the

WINWOOD BODYWORK ON 30-CWT. CHEVROLET.

firm's standard design for 30-cwt. Ford and 30-cwt. Chevrolet chassis.

The Ferodo Mileage Chart.—Ferodo Limited, of Chapel-en-le-Frith, makers of the well-known Ferodo Brake Linings, have issued a handy mileage chart, extremely simple to work, and showing the approximate distances from eighteen of the largest cities in the country to about fifty-six other towns. Copies of the chart may be obtained from the Advertising Department, Ferodo Ltd., Chapel-en-le-Frith, via Stockport.

County Court Judgments.

THE following returns from the Registry of County Courts' Judgments, Whitehall, have been received relating to judgments entered up in the respective County Courts of England and Wales. Publication does not imply inability to pay. Many judgments may have been settled between the parties or paid. Judgments settled otherwise than through the Court may appear unless "satisfaction" is entered up within twenty-one days from judgment or allocatur. Registered judgments are not necessarily for debts. They may be for damages or otherwise, they may relate to actions *bona fide* contested between the parties, or they may be against defendants, liable in a representative capacity, and not personally; but no distinction is made on the register. Judgments are not returned to registry if satisfied in Court books within twenty-one days.

F. Guymer, 28 Derbyshire Lane, Sheffield, haulage contractor. £45/2/9. August 12th.

G. H. Mason, 2 ct., 4 Haigh Lane, Sheffield, haulage contractor. £27/19/3. August 8th.

Wm. Ball, Down Street, Clydach-on-Tawe, Glam., haulage contractor. £107/5/6. July 24th.

Preserve the Countryside.—The Automobile Association appeals to all road users to co-operate during the winter in protecting from wanton destruction the numerous beauty spots, woods, forests, etc., which afford us so much pleasure during the spring, summer and autumn. Many of these precious and unique bits of British scenery are suffering badly through the removal of young trees and bushes, and the breaking down of branches.

Appreciation of Sympathy.

Mrs. James A. Oswald, of 43, Khedive Road, Forest Gate, wishes to express her appreciation of sympathy extended to her in her great loss.

Development of British Ports.

We have had the opportunity recently of inspecting a number of the great ports of the country, and we have been considerably encouraged in our belief in the future of British trade by seeing the great improvements which have been made since the termination of the Great War in increasing their facilities. In September last we were present at the opening of the new lock at Tilbury, owned by the Port of London Authority, and saw the great landing stage just nearing completion which will once more enable the Port of London to provide facilities for the largest ships afloat. We have just recently been over the docks controlled by the Port of Bristol, of which some brief account is given in this issue, and we were glad to see that the new Eastern extension of the Royal Edward Dock, which we were privileged to see opened by H.R.H. The Prince of Wales in May 1928, is now in full working order and is providing facilities for grain transit and storage second to none in the United Kingdom. The report, therefore, of the Port Facilities Committee, which was published after the issue of our last number, is exceedingly interesting, because it shows that those concerned in shipping are not content to rest upon the improvements already completed, but are ready and anxious to develop still further our port facilities, provided ways and means can be found. The Port Facilities Committee comprised representatives of the Chamber of Shipping, the Association of British Chambers of Commerce, and the Federation of British Industries, and they have followed up the publication of their report by a representative deputation to the Ministry of Transport, at which they put forward their views to Sir Cyril Hurcomb, the Permanent Secretary to the Ministry. The Committee distinguish between port facilities and shipping services, emphasising that the shipping industry has always relied on private enterprise and the free play of economic factors and does not ask for state aid, with state control as a necessary corollary. They consider, however, that the ports of the country are in a different position, and their reasons for making this distinction are that foreign shippers have complained of the absence of modern loading and discharging facilities in some of our ports; on the vital importance to our import and export trade of the provision of up-to-date port facilities, and thirdly on the urgent need for reducing unemployment by means of schemes which can be advocated as economically sound. As our columns have recorded month by month the great ports of the country have been spending large sums of money since the close of the War on improving their port facilities, but the Committee is of the opinion that many further schemes of useful and necessary work would be put in hand by the various port authorities provided they were assured of Government support. The members of the Committee, as practical men, did not content themselves with receiving evidence but took the step of visiting the ports of the country and seeing for themselves the facts of the situation. As a result they mention several large ports at which they consider further developments are urgently required and they recommend schemes of development which they consider are economically sound in such ports as Glasgow, Leith, Newcastle, Middlesbrough, Hull and Swansea. They lay more emphasis, however, on the need for assisting the smaller ports of the country, at which in former days our very important coastwise trade was a special feature. They point out that many of the small ports which once carried on a flourishing trade are in danger of becoming obsolete, and in some cases the trade has practically left the ports, having been diverted to other channels by the energy and enterprise of rival means of transport. The Committee is of the opinion that sea-going motor barges could be usefully employed, where larger vessels were impracticable, and that a new era of prosperity was possible for a comparatively slight expenditure. In their interview with the Ministry of Transport the speakers of the deputation further emphasised the great importance of improving the roads leading to the docks, specially mentioning those connected with the Port of London Authority, but which were not under its jurisdiction. The chairman of the Port Facilities Committee stated that the facilities at the near Continental Ports, such as

Digitized by Google

Antwerp, Hamburg, Amsterdam and Rotterdam, as well as at some of the Italian ports, were superior to some British ports. He also referred to the difference in freights charged from Continental and British ports which was handicapping British exports. Sir Cyril Hurcomb, in replying to the deputation, was sympathetic to the aims of the Committee and said that he fully appreciated the needs of shipping. He mentioned, with regard to the road approaches to the London docks, that the report of the London Traffic Advisory Committee's Visiting Committee had been received and was under consideration with a view to action in the near future, and other developments referred to by the deputation were also under consideration. It is interesting to record, as we do in this issue, that at a time when special efforts are being made to provide schemes which shall reduce unemployment and at the same time increase the prosperity of the country, the Port of London has issued its traffic figures for the eight months, from April to November, 1929, showing a considerable improvement in the tonnage and giving figures which constitute a record in the history of the Port of London. Out of a net registered tonnage of 255,465,280 for all U.K. Ports the Port of London accounts for 39,605,279. It is further interesting and encouraging to find that the increasing activity of the Port comes from widespread sources and is not confined to any one particular section of trade. In the report which has been issued the Port of London Authority claim that this record return is accounted for by the vastly improved dock accommodation and equipment provided by the Authority during their 21 years' regime, coupled with the dredging of a wider and deeper navigable channel in the river. As a result of these improvements and other economies effected by the Port Authority they have been able to reduce some of their charges, which will represent a saving to shipowners and shippers using the port of an amount estimated at £250,000 per annum. While the able administrators of our great docks consider that there is justification for spending large sums of money in improving the facilities, and while those able men at the heads of the various associations interested in shipping, consider it worth while to give their valuable time to inspect our ports and make recommendations for their further improvement, we need not be downhearted about the trade of the country, and it is to be hoped that the Government will see their way to provide the financial resources necessary to make the further improvements which have been so well advocated.

Comment on Current Topics.

The Road Traffic Bill.

In the December number of *The World's Carriers* we dealt with the Road Traffic Bill, taking particular exception to clauses contained in Part 5, and we are, therefore, gratified to note that an amendment was carried in the House of Lords on December 18th by 24 votes to 11 by which Clause 92, which had for its object the granting of powers to local authorities to run public service vehicles outside their own areas, was rejected. No doubt there will always be divided opinion as to what constitutes desirable municipal trading and that which is undesirable. Broadly speaking, however, one would suppose that the line of demarcation comes between the two points, one being whether the rights of the individual are jeopardised by municipalisation and the other being the point whether there can be no other interest but the welfare of the individual. Water, gas, electricity and transport undertakings, however, fall under a different category. In cases where these are carried on as private undertakings, they are so much hedged about by local requirements that they are compelled to provide efficiency in every respect. In the case of municipally owned services of this description it cannot be said that control is so efficient for the simple reason that the censors or supervisors themselves are responsible only to themselves. But we do not wish to enter into a general argument either for or against municipal trading, we simply wish to give it as our emphatic opinion that transport is best provided by private enterprise under reasonable supervision. Municipal transport has always been disappointing for the reason that there was no incentive to improve where it held a monopoly. The introduction of the motor bus and motor coaches brought about this incentive, with the result that municipal undertakings either succumbed or became heavy burdens to the ratepayers or have survived owing to unfair competition. Whilst in the case of companies supplying such commodities as water, gas and electricity, in the past there has been much exploitation by company promoters, particularly in the case of water undertakings, there has been practically nothing of the kind in motor transport undertakings. The latter have established themselves under great difficulties, inseparable from pioneer undertakings, and, in addition, they have had to work against prejudice and direct opposition. Private transport undertakings now have every prospect of making good, if they are left reasonably to themselves but, if they have to fight municipal competition, they stand not the slightest chance and would be well advised to close down their undertakings. If the decision of the House of Lords were final there would be no necessity for us to refer to this matter again, but the Bill has still to come before the House of Commons, and Mr. Herbert Morrison in a recent speech indicated that it was the intention of the Government to re-introduce Part 5 of the Bill. Part 5 of the Bill, deleted by the House of Lords, is not the only objectionable feature of the Bill. Clause 18 for instance (limitation of time for which drivers of certain vehicles may remain continuously on duty) if passed into Law would clip the wings of motor transport even more effectively than the proposed speed limits, which are dealt with in a separate article in this issue. Clause 18 proposes to make it illegal for the driver of public service vehicles and goods vehicles to remain on duty for more than five hours at a time or more than ten hours in any consecutive twenty-four hours. Now every motorist knows, or should know, that, with the exception of bus drivers, a motor driver's job is to-day one of the easiest, most comfortable and desirable of any employment with equivalent pay. One only had to examine the comfort provided for drivers in the driver's cabs on the vehicles exhibited at the recent Olympia Commercial Motor Show to appreciate how exceedingly comfortable they are. The driver of a commercial vehicle to-day, unless he be an owner driver, which class the Bill does not touch, has practically nothing to do but drive. It is not part of his duty to keep his vehicle in order. Drivers of commercial vehicles, both passenger and goods, are of necessity selected from the ranks of those who are physically fit and, whilst it is indeed undesirable that they should be compelled or permitted to drive for unreasonably long hours, the five hour limit and the 10 hour limit in the 24 are both ridiculous, and we are convinced that no conscientious driver would desire to be so limited and, furthermore, should this Clause become law great numbers of drivers would be forced into the ranks of unemployment. The Bill, as it stands, even with the House of Lords Amendment, broadly speaking,

Digitized by Google

emancipates the private motorist and enslaves the commercial motorist. If passed into law it will constitute one of the shrewdest blows from which commercial motoring, as conducted by private enterprise, has yet suffered.

Railway Traffic in 1930.

As is the usual custom, the General Managers of the great railway companies have issued statements on the position of the railway companies, in some cases in the form of a New Year's message to the staff. Sir Josiah Stamp in his message refers to the steps taken to establish the London, Midland and Scottish Railway in the omnibus business of the country, since the passing of the Act of 1928, which gave them powers to run road motor services of all kinds. He gives a list of the omnibus undertakings in which the Company has become interested and this list is an imposing one, showing how widespread are the ramifications of combined rail and road transport. He states further that it is the intention of the management ultimately to secure such interest in the omnibus industry of the Company as is consistent with the full powers conferred by Parliament. The object of the negotiations is to secure as between railway and road services the fullest measure of co-ordination for the benefit of the undertakings and of the travelling public. Mr. William Whitelaw, Chairman of the London & North Eastern Railway Company, in his New Year's message, states that they can all look back upon last year as one in which their hopes had been realised, in no small degree, they had recovered millions of passengers and increased their freight traffic by millions of tons, and the whole organisation had worked with a success and smoothness which reflected credit upon the entire staff. Mr. James Milne, the General Manager of the Great Western Railway Company, is proud to be able to record that still further progress had been made during the past year and he believes that when the results of the year's working are published they will show that the Great Western Railway continues to hold its high place in the world of transport. Mr. R. H. Selbie, Chairman of the Railway General Managers' Conference, in a New Year's message, states that the year just completed has been brighter than its predecessor for railway interests. He goes on to say that there are signs of an awakening to the fact that as the railways have long since ceased to hold any monopoly of the transport work of the country they must be freed from many of the hampering restrictions placed upon them when that monopoly existed. All the railway managers take an optimistic view of the situation now that they have obtained powers to run road motor services and have been able by means of these powers to secure working arrangements and in many cases a controlling interest in well-established road transport organisations. These optimistic views may be justified by results, but it is essential to bear in mind that the first necessity is the provision of adequate travelling facilities at the lowest cost to the general public and that if co-ordination of rail and road services provides this it will be justified, but if it results in the reduction of facilities, with an increase of the cost of travelling and of transport charges, then it will be a bad day for the trade and commerce of the country.

The 1930 Motor Coach Season.

Though still early in the year it is not too early to begin to make preparations for the coming motor coach touring season. During the past two or three years motor coach travel has become firmly established, not only for touring but as an all-the-year-round business proposition to accommodate business people. Nevertheless, regular all-the-year-round services will have to be considerably augmented to accommodate the holiday traffic. Experience in the past has been so encouraging that this year, without a doubt, a still larger percentage of holiday makers will decide to patronise the road and also, no doubt, a great deal more money would have been invested in the coaching industry were it not for the proposed new legislation —30 miles per hour speed limit—and some doubt as to what the effect of the proposed new licensing regulations will have on the freedom of travel in connection with selection of stopping places and routes. But it may be taken for granted that the current year will see no changes in these regulations, as, whatever may be the fate of the Traffic Bill in Parliament, it is not likely that the new regulations will come into force until 1931. *The World's Carriers,* as in previous years, will continue, in its Motor Coach and Bus Section, to keep its readers fully informed on matters affecting them in the passenger transport industry. The most important matters at the moment, requiring the united effort of all those interested in passenger services for the purpose of resistance, are (1) the 30 mile speed limit; (2) the limited hours of working for passenger vehicles drivers; (3) the compulsory backing of licences by all local authorities through which motor coach proprietors propose to run their vehicles, and it is also very important that the proposed new system of licensing should be most carefully considered as it may be that, if the present proposals become law, the control of public service passenger vehicles will be so stringent that there will be little room or encouragement for development.

Motor Owners and Police "Persecution."

There is one grave feature of recent legislation and regulation by the Minister of Transport which demands the serious consideration of all motor vehicle owners, and that is the increasing authority wielded by the police in all matters relating to transport by road. In former days it was the custom of various provincial towns to provide a substantial revenue by means of police traps, resulting in heavy fines against motorists who exceeded the speed limit. This campaign has almost ceased with the exception of one or two benighted districts, and should the road traffic bill, abolishing the speed limit, become law, it will die a natural death. The police will now turn their attention to the subject of dangerous driving, a matter upon which we hold very strong views and which we should like to see stopped by the most stringent means possible. At the same time, we do not agree with the arrangements whereby one policeman, who after all is a fallible human being, shall have the power to decide what is dangerous driving and what is not. When we come to the commercial motor vehicle user the police have the power to harass him in many directions. We have recently had the opportunity of discussing this with road users carrying on both local and long distance services, and they are strongly of opinion that the prosecutions to which they are subjected, virtually mean persecution by the police. Now that regulations have been made on the subject of excessive noise a further terror has been added to those already borne by the motor vehicle driver. Even if after being summoned the case is dismissed, valuable time and expense have been incurred, and should a conviction result, on what the owner may consider biased evidence, he is usually not in a position to proceed further owing to the very heavy expenses which would be incurred. We strongly urge all our readers who are harassed in this way, to approach their local associations and through this means, or if necessary through the national body to which their local associations should be affiliated, to secure the consideration of their grievances and if they have good cause for complaint, a strong appeal should be made for an alteration in the law or the regulation which allows such unjust actions to be taken.

Notes and News.

L.M.S. Appointments.—The London, Midland and Scottish Railway Company make the following announcement:—Following the retirement of Mr. F. G. Evans, C.B.E., vice-president, railway traffic operating and commercial section, Mr. W. V. Wood has been appointed vice-president, finance and service departments, and Mr. J. Quirey, C.B.E., has been transferred to the post vacated by Mr. Evans. Mr. H. V. Mosley has been appointed chief executive officer for new works and Parliamentary business, in which capacity he will attend the Executive Committee. Mr. Ernest Taylor has been appointed chief accountant in succession to Mr. J. F. Gee, retired.

Mr. James Davidson's New Appointment.—Mr. James Davidson, who was for a number of years under Mr. R. J. Armstrong at John Walsh, Ltd., Sheffield, and lately with Jas. Shoolbred & Co., Ltd., London, has been appointed Removals and Warehousing Manager for Shaw's Depository, Ltd., Blackpool.

G.W.R. Appointments.—The appointments of Mr. H. E. Cracknell, district goods manager, Newport, to be district goods manager, Cardiff, and Mr. H. W. Payne, chief clerk to the chief goods manager, Paddington, to be district goods manager, Newport, have been approved by the directors of the Great Western Railway.

New G.W.R. Director.—Captain Harold MacMillan has been elected a director of the Great Western Railway Company to fill a vacancy on the Board.

The Prince of Wales and the Buenos Aires Exhibition.—H.R.H. The Prince of Wales has expressed his willingness to become Patron of the British Empire Trade Exhibition, which will be held in Buenos Aires from February 18th to April 2nd, 1931.

New L.M. & S. Directors.—The London, Midland and Scottish Railway Company announce that Mr. J. H. Houldsworth has retired from the board of the company but remains a member of the Scottish Committee. The Right Hon. Walter Runciman, M.P., and Major Ralph Glyn, M.P., M.C., have been elected directors.

TO ALL OUR READERS
A
Happy & Prosperous
New Year

National Furniture Warehousemen's Association.—The eleventh annual meeting of the National Furniture Warehousemen's Association of America is now being held at the Edgewater Gulf Hotel, Edgewater Park, near Biloxi, Mississippi; the meeting terminates on January 19th. The 39th annual meeting of the American Warehousemen's Association is being held at the same hotel from January 20th to 23rd. We hope that our friends on the other side will have happy and successful meetings.

New Chairman of Railways Staff Conference.—Mr. Kenelm Kerr, assistant general manager of the L.N.E.R., has been appointed chairman of the Railways Staff Conference, in succession to Mr. W. Clower, who has retired.

New Cunard Director.—The Cunard Steam Ship Company announces that Mr. Sidney John Lister, one of the managers, has been elected to a seat on the Board. Mr. Lister entered the service of the company 35 years ago. He was last year's president of the Liverpool Steamship Owners' Association and is a director of the American-Levant Line and the Hudson's Bay Company Overseas Settlement.

British Railways Advertising.—Mr. G. H. Loftus Allen, advertising and publicity officer of the L.M.S. Railway, has been appointed chairman of the British Railways Advertising and Public Relations Committee for the year 1930.

Motor Hirers and Coach Services Association.—In our report in the December issue of the speech made by Mr. M. Logette, Chairman of the Management Committee, Motor Hirers and Coach Services Association, at a Conference at Olympia, held in November last, we did not make his meaning quite clear in one respect. He was speaking on the question of licence fees as dealt with in the Reports of the Royal Commission on Transport. He said that operators would have to obtain a certificate of fitness for a vehicle; that Certifying Officers were to be appointed and paid fees on a prescribed scale in respect of the vehicles examined, and that "he advocated there should be no certificate and no fee." Of course, what Mr. Logette meant to convey to his hearers was that if a Certifying Officer refused to issue a Certificate of Fitness for a vehicle then no fee at all should be payable, and he recommended that endeavours should be made to have inserted in any Bill the actual fee to be paid for a Certificate of Fitness when granted.

Omnibus Chassis for Norwegian State Railways.—The Acting Commercial Secretary, His Majesty's Legation, Oslo, reports that the Norwegian State Railways are likely to purchase in the near future a number of omnibus chassis, preferably of the big single deck type and with a seating capacity of about 50 passengers. Firms desirous of offering British built omnibus chassis can obtain further particulars upon application to the Department of Overseas Trade, 35 Old Queen Street, London, S.W.1. Reference number AX. 8956 should be quoted.

Gold by the Ton.—Recently, £1,000,000 in Australian sovereigns passed through the streets of the city of Hull on its way to London and the Bank of England. The precious cargo had been brought from Australia by the steamer Ulysses, and was divided into 2,000 cases each containing £5,000. The cases were placed in three pantechnicons and taken to the railway station, which was reached about 8 a.m. An hour later they were on their way to London, and the following day the Bank of England duly made public the fact that £1,000,000 in Australian gold had been received. The furniture vans belonged to Selle & Co., removal and storage contractors, Hawthorn Avenue, Hull, who held the contract for removing this huge quantity of gold.

Roads and Bridges Committee of the House of Commons.—A deputation from the Roads and Bridges Committee of the House of Commons was received by the Lord Privy Seal and the Minister of Transport on December 23rd last. The object of the deputation was to lay before the Ministers concerned suggestions by which they thought road works for the relief of unemployment could be put in hand more expeditiously. They suggested that there might be a tendency on the part of local authorities to hold their hands in the hope of obtaining larger grants. If the present terms really represented the final offer of the Government the sooner local authorities were definitely told so the better. The deputation also made certain other suggestions by which they thought procedure might be speeded up and referred particularly to the rebuilding of weak bridges over railways and canals. In reply the Lord Privy Seal expressed sympathy with the general aims of the deputation and said that he and the Minister of Transport were already doing all they could to expedite matters. He would be glad of the co-operation of the Committee in bringing before local authorities the desirability of proceeding at once on the advantageous terms now offered them, which certainly would not be improved. With regard to weak bridges over railways and canals, the Minister of Transport reminded the deputation of the provisions of the Bridges Act, 1929, and informed them that a circular had been issued to all local authorities in July last to the effect that grants for this purpose were available at the rate of 75 per cent. of the net cost falling upon the highway authority in cases where a new liability was incurred under the terms of the Act.

Change of Address.—We announced in our December issue that Messrs. G.m.b.H. Edmund Franzkowiak and Co. had been elected to membership of the British Association of International Furniture Removers. The firm inform us that they have now moved to Hamburg 1, Bahnhofstrasse 11, to which all communications should now be addressed.

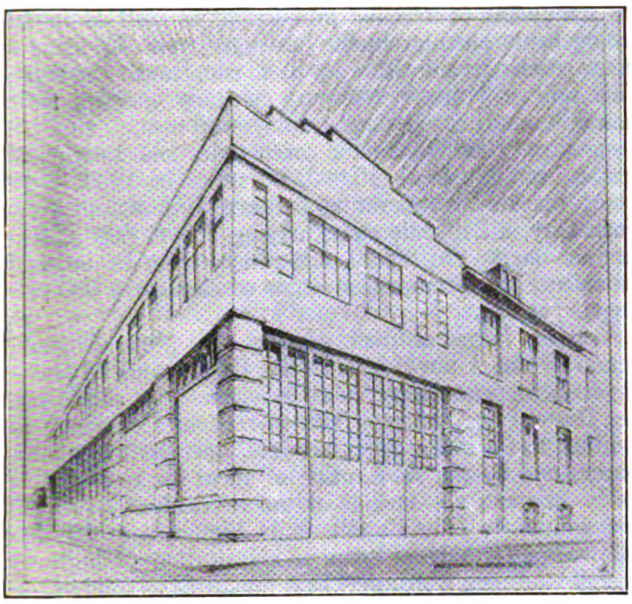
"Gilford" New Offices and Showrooms. — We have pleasure in reproducing the architects drawing of new offices and showrooms to be opened shortly by the Gilford Motor Company, Ltd., at 465 and 471a Holloway Road, London, N.7.

"White Cross Line." — A regular service by new (100 A1) steamers from Antwerp and/or London (as inducement offers) and Newport, Mon. (or Cardiff) to Brazil, Uruguay and Argentina is now being run by the White Cross Line. The Managers of the Line are Pardoe-Thomas & Co., Ltd., and they will despatch steamers as under (subject to conditions of the Line's Bills of Lading):—s.s. "Knight of the Cross" (6,400 tons D.W.) closing Antwerp, 21st January, Cardiff, 26th January for Rio de Janeiro, Rio Grande do Sul, Monte Video, Rosario and Santa Fé; s.s. "Knight of the Rose" (6,400 tons D.W.) closing Rotterdam, 14th February, Antwerp, 17th February, Newport, Mon., 21st February for Rio de Janeiro, Santos, Monte Video, Rosario and Santa Fé; s.s. "Knight of St. Michael" (6,400 tons D.W.) closing Antwerp, 13th March, London, 15th March, Newport, Mon., 20th March for Rio de Janeiro, Santos, Monte Video and Buenos Aires; s.s. "Knight Almoner" (7,200 tons D.W.) closing Antwerp, 9th April, London, 12th April, Newport, Mon., 17th April for Pernambuco, Rio de Janeiro, Santos, Monte Video, Buenos Aires, Rosario and Santa Fé. The Loading Brokers for the Line are as follows to whom an application for rates will receive immediate attention:—Newport, Mon., Pardoe-Thomas & Co., Ltd., 107 Dock Street; Cardiff, Pardoe-Thomas & Brother (Cardiff), Ltd., Cymric Buildings; Bristol and Avonmouth, Pardoe-Thomas (Bristol), Ltd., 129 Cumberland Road; Birmingham, Pardoe-Thomas & Co., Ltd., Newspaper House, Corporation Street; Manchester, Herbert Watson & Co., Ltd., 2 Bank Street, St. Ann's Square; London, Pardoe-Thomas & Co., Ltd., 17 Gracechurch Street, E.C.; Antwerp, P. A. Van Es & Co. Consortium, Savon Freres; Rotterdam, Hamburg and Amsterdam, P. A. Van Es & Co.; Paris and Strasbourg, Consortium Savon Freres; Pernambuco and Bahia, Wilson, Sons & Co., Ltd.; Rio de Janeiro and Santos, E. Johnston & Co., Ltd.; Rio Grande do Sul and Porto Alegre, Wilson, Sons & Co., Ltd.; Monte Video, Buenos Aires, Rosario and Sante Fé, Christophersen, Hermanos.



SKETCH OF THE GILFORD MOTOR CO.'S NEW OFFICES AND SHOWROOMS TO BE OPENED SHORTLY.

The Italian Art Exhibition.—In co-operation with the Anglo-Italian Express of 5 Fore Street Avenue, E.C.3, the official transport agents for the pictures that came from Italy for the exhibition of Italian masterpieces, now being held in London, Evan Cooks Depositories, Ltd., 134 Queens Road, Peckham, transported to the Royal Academy the pictures that arrived here in the "Leonardo da Vinci." The firm's fleet of Leylands left the docks at noon on the Saturday in a long convoy headed by a motor car containing the Italian officials, and flying the Italian flag. Those vans containing the most valuable pictures were zinc lined and hermetically sealed and the pictures were beautifully packed. The fourteen empty vans are now held at Evan Cooks Lift Van Park awaiting the close of the Exhibition. It is impossible to estimate in money the value of these pictures but they must be worth many millions of pounds.

ONE OF EVAN COOK'S LEYLAND LORRIES ENGAGED IN TRANSPORTING ITALIAN MASTERPIECES.

New Year's Honours.

INCLUDED in the list of New Year's Honours are the following:—

BARONS.

Mr. Arthur Augustus William Harry Ponsonby, M.P., Parliamentary Secretary, Ministry of Transport. For public and political services.

Sir Charles Cheers Wakefield, Bt., C.B.E., LL.D. For public and philanthropic services. Governing Director of C. C. Wakefield & Co., Ltd.

K.C.M.G.

Sir Edward Thomas Frederick Crowe, Kt., C.M.G., Controller-General of the Department of Overseas Trade.

C.B.E.

Mr. Alfred Dryland, M.Inst.C.E., County Surveyor, Middlesex. A past President of the County Surveyors' Society and the Institution of Municipal and County Engineers.

Mr. Sidney Stallard, D.S.O., O.B.E., Divisional Road Engineer, Ministry of Transport.

O.B.E.

Mr. Tom Shirley Hawkins, M.B.E., M.Inst.C.E., Civil Engineer, Secretarial Department, Ministry of Transport.

Obituary.

W. Van Oppen.

IT is with the deepest regret that we record the death of Mr. W. Van Oppen, the founder of Van Oppen & Co., Ltd., and up to the time of his death Managing Director of the Company, which took place on Wednesday, December 18th last, after a very brief illness. In our last issue we gave some particulars of the business, with a photograph of Mr. Van Oppen, on the occasion of the jubilee of the firm, marked by the presentation to Mr. Van Oppen of gifts signifying the high esteem in which he was held. At the Annual Dinner of the London Shipping and Forwarding Agents' Conference held late in November, we had the pleasure of meeting Mr. Van Oppen and of having a chat with him and congratulating him upon his good health. In doing so, we commented on the fact that he appeared to look as young and active as when we first made his acquaintance some twenty-five years previously. It is, therefore, difficult to imagine that he has passed away and we offer our sympathy to his colleagues and in particular to Mr. A. F. J. Brown, his co-director, who has been associated with him for forty years.

A Review of Road Transport.

ONLY a very few years ago the British industrial motor industry appeared to be at a standstill, so much so that when any marked improvement either in design or equipment made its appearance on the British market, it was usually concluded without enquiry that it emanated from some foreign source. To-day the position is vastly different; never before has the British industry been so self-reliant and progressive.

The lethargy of the past was due to a very great extent to the unfortunate policy of the Government in placing on the market innumerable ex-service vehicles not only of British but also of foreign manufacture. The ill-effects of this policy is felt even to-day, many of the best known of our manufacturing firms being only just emerging from the financial straits in which it placed them. It was small wonder that manufacturers had little cash to spare for experimental work and the creation of new and improved models.

Another reason for the greatly improved position of the industrial motor industry is that the manufacturer and user are now a great deal more in sympathy than they were. It may be said with truth that both manufacturer and user have been serving 20 years apprenticeship. On the one hand, the manufacturer did not know what types of vehicles the users required and would produce a vehicle trusting to luck that it might possibly fill some need in the road transport industry. On the other hand, the user would purchase a vehicle and hope that he might find work suitable for it. It was a "hit or miss" policy, but quite unavoidable as education had to come from practical experience, theory being of little or no assistance. The position now is that both manufacturers and users are equally experienced in the road transport industry. Both have gained much knowledge during the past few years, and as this knowledge increases so will the cost of road transport decrease until a minimum is reached.

The progress of road transport, however, is by no means uniformly smooth. Legislation has always been rather against it than with it, and uncertainty with regard to what is going to happen next continues to impede its progress.

One of the most important matters affecting road transport during the past year is the development by the railways of their newly acquired road carrying powers. This development is being watched with the keenest interest by the road carrying industry and with no little apprehension. The railways have already acquired controlling interests in very many of the largest passenger carrying services in the country, but it would be incorrect to say that they are making bold use of their powers. It is obvious that their present policy is as far as possible to co-ordinate road and rail transport instead of developing each on its merits. Whether their policy is correct or not time alone can show. It will depend upon in how far the railways are willing to provide the public with travelling facilities even superior to those which it is now enjoying. The public is now educated and appreciates alternative methods of travel, and every village in the Kingdom is provided with easy means of travel to any part of the country. Competition has increased the comfort of vehicles and kept the fares reasonably low. Passengers may reach their destination either entirely by road or partly by road and partly by rail. There is freedom of choice, and if the railways seek to limit this freedom there will be such serious opposition to their virtual monopoly that it may result in new legislation.

In connection with rail and road passenger services it is interesting to note what is happening in the United States. The New England Transportation Company, a subsidiary company of the New York, New Haven and Hertford Railway Company, is operating 61 motor coach routes covering 2,200 route miles in an area of approximately 30,000 square miles. According to the officials of that Company, it has been very successful from the standpoint of revenue production, as well as in reducing losses on unprofitable passenger trains by using a motor coach as a substitute for or to supplement the train. This rail road motor transport company operates more than 300 motor coaches and employs 500 men. In 1928 it operated 9,000,000 motor coach miles and anticipated that it would operate 10,000,000 miles in 1929. 59 motor coaches are operating between Boston and New York City, a 240 mile run, carrying 500 to 600 passengers per day. On the 40 mile run between Boston and Providence these companies' motor coaches carry 900 passengers per day.

Another large railroad serving the New England section of the United States—the Boston and Maine—also has extensive motor coach services. Its subsidiary, the Boston and Maine Transportation Company, in addition to its motor truck services, operates 111 motor coaches and by the substitution of them for unprofitable trains estimates the savings of the railroad at £100,000 per annum. The Boston and Maine railroad has followed a formula or plan of substitution of highway for rail transport which may be summarised as follows:—

(1) Complete substitution of motor coach for steam-train branch line passenger service.

(2) Partial substitution on branch lines.

(3) Partial substitution on main lines.

(4) Complete substitution for electric railways owned by the Boston and Maine railroad.

(5) Complete substitution for electric railways not owned by it.

(6) Motor coach operation to supplement steam railroad passenger service.

With regard to the inter-state motor coach services in the U.S.A. these carried approximate 29,000,000 passengers in the year 1928. An official of one of the Trans-Continental lines operating out of New York City stated that between September 11th and October 16th, 1928, the average ticket sale was for a distance of approximately 1,100 miles.

The Greyhound Lines and Yellow Stages motor coaches has established the longest, largest and most dependable motor coach system in America. It operates from coast to coast and from the Great Lakes to the Gulf of Mexico and from the Canadian to the Mexican border. It is allied with 7 of the largest railroad systems of the United States and is regarded as the beginning of the most comprehensive system of co-ordinated rail and road transport facilities in the world. The longest runs are between New York and Los Angeles and New York and San Francisco, the distances being in both cases approximately 3,400 miles. By rail the distances are approximately 3,150 miles. The time occupied by motor coach is 134 hours, as compared to 92 hours by rail, showing 42 hours in favour of the rail. The fares by motor coach are approximately 70 dollars, as compared with 109 dollars by rail, showing about 40 dollars in favour of the motor coach.

The above are merely incidents of the motor coach development in America, which is proceeding with great rapidity. We are indebted for the information to Mr. Frederick C. Horner, being extracts from a paper he

Digitized by Google

read before the Transportation Meeting of the Society of Automotive Engineers in Toronto, and more recently in Tokio, Japan.

It will be gathered from the above notes that the American railway interests do not appear to be so slavishly and blindly adhesive to their railway transport as is the case in this country. It is only in extreme cases that the railway companies in this country give their passengers choice between rail and road travel. On the other hand, however, it must not be forgotten that the road services of the British railways are only in their infancy; the coming year will undoubtedly see some remarkable developments.

It should also be noted that in cases where the American railroads are running either their own subsidy motor coach services or are co-operating with privately owned motor coach services, they are not increasing the motor coach fares in order to coerce travellers to use the rail or, in other words, they rely upon the time factor to even up the balance of attraction.

Turning now to goods transport by road in this country; railway developments in this direction are not so obvious as in the case of passenger services. We note, however, that since the railways have obtained their road transport powers they have become one of the best customers to the motor manufacturing industry, and railway forwarding agents also will no doubt participate and benefit by railway development in this direction.

But the most remarkable development during the past year in goods transport by road is the provision of new types of vehicles to suit all classes of conveyance. On new types of vehicles it is possible to transport unit loads such as machinery weighing upwards of 100 tons, without transferring undue stresses to the road surface, this result being obtained by the provision of an indefinite number of wheels mounted on short axles free to oscillate, so that every wheel may at all times carry its share of load, irrespective of road inequalities within reason. These exceptional vehicles are almost invariably built for haulage by traction engines or tractors.

The articulated six-wheeler can now be built to carry 20 tons or thereabouts without infringement of the law. These vehicles may be built either with a four wheel bogie at the rear, or four separate rear axles each carrying two wheels and two front axle wheels, and they are hauled by any convenient form of tractor. Provision is made for raising the front end of the semi-trailer so as to transfer part of the load on to the driving wheels of the tractor to provide adhesion. These new type articulated vehicles have all evolved from the original Scammell articulated six-wheeler placed on the market shortly after the war. These vehicles are increasing in popularity with road transport users as they are economical in operation, comparatively fast and the taxation is reasonable and they have the very great advantage that one tractor can operate several semi-trailers and so save terminal delays.

The rigid six-wheeled type of vehicle has grown into favour with most remarkable rapidity for both passenger and goods transport.

We mention particularly the above types of vehicles because their importance is more far-reaching than casual observation would appreciate. Not only do they enable heavy loads to be carried without undue axle weight, but they enable exceedingly bulky and light loads to be carried on light vehicles. With the exception of vehicles intended for the very heaviest load, the muti axle vehicles permit the use of pneumatic tyres, which is not only an advantage to the vehicles themselves, but also an advantage in the matter of road wear.

It is particularly interesting to note in this connection that although the number of vehicles on the roads to-day is about five times as many as in 1920, the number of commercial goods vehicles has increased six fold since 1919, speeds have increased and gross weights have increased in the case of the heavier vehicles and with the increase in speeds, the vehicle mileage has also increased, nevertheless, the expenditure per mile on ordinary maintenance and repairs of Class 1 and 2 roads and bridges in Great Britain, shows a considerable reduction. In the Report of the Administration of the Road Fund for the year 1928—1929, the expenditure per mile on Class 1 roads is given as £604 for the year 1923—1924, as compared to £534 for the year 1928—1929. With regard to Class 2 roads, there has been a slight increase from £315 per mile to £341 per mile, nevertheless, the average for both classes of road has dropped from £459 per mile in 1923—1924 to £437 per mile for 1928—1929. The significance of the figures would seem to be that the peak figure of road maintenance costs has been reached, and this is due to improvements both in road and vehicle construction, and to improvement in road construction and maintenance methods. The motor engineer has met the road engineer at least half way, if not more.

The advance in scientific knowledge both in mechanical engineering and civil engineering as applied to road use and construction, and in its practical application is of still more far-reaching importance when considered from an Empire point of view. There are vast areas of the British Empire undeveloped for want of good roads, and which would have remained undeveloped for generations did the modern road vehicle still require the same road crust strength it did, say, ten years ago. To-day, loads double the weight of those carried on vehicles ten years ago, can be carried at one-half, or even less, weight per square inch of road, and there is a corresponding reduction in the strength of road crust necessary, and also a corresponding reduction in the cost of road construction and maintenance. This is a vastly important matter bringing the responsibility of industrial development of great tracks of country to an economic figure. In this connection we do not forget the recent remarkable development of the "Roadless" or girder track vehicle which for pioneer work must continue to be a factor of inestimable value.

At the beginning of this article we have referred to unsympathetic legislation in connection with road transport development in this country. As an instance of what is meant by this it is necessary to consider the proposed speed limits contained in the Roads Traffic Bill now before Parliament. Taking for example the speed limit of 20 miles per hour it is proposed to impose on heavy goods vehicles, *i.e.*, vehicles weighing upwards of 2½ tons. Twenty miles per hour is absurdly slow, even for heavy vehicles, as every motorist knows. It must be remembered that the speed limit of 20 miles an hour does not mean an average of 20 miles per hour, but a maximum, and therefore the average would be reduced to about 15 miles an hour. Suppose then a vehicle having overhead charges such as interest, depreciation, insurance, rent, driver's wages, tax and establishment charges amounting to £2 10s. per day, such a vehicle we may assume is easily capable of an average speed of 25 miles per hour. In a working day of eight hours it could therefore cover 200 miles, thus the standing charges would be 3d. per vehicle per mile. Supposing the driver observed the speed limit strictly, he could average no more than 15 miles per hour, equivalent to 120 miles in an eight hour working day, representing 5d. per mile standing charges. Thus, not only is the expense of running the vehicle at two-thirds of its capacity increased by 2d. per mile, as compared to running it to its full capacity (exclusive of running charges), but one-third of the day and one-third of the earning power of the vehicle are lost. One day in every three days is lost, or, in other words, where three vehicles only would be required, working at their full capacity, four vehicles

Digitized by Google

would be required working to the artificial speed limit capacity, and the cost per annum of the extra vehicle would be approximately £600 exclusive of actual running costs such as tyres, fuel, oil and maintenance.

If there were justification for this artificial speed limit, there would be no room to complain, but statistics compiled by the Safety First Council and by the Ministry of Transport or both in collaboration, shows that industrial vehicles are responsible for fewer accidents on the road than private cars and, furthermore, excessive speed—unless included in negligent driving—is not recorded as a cause.

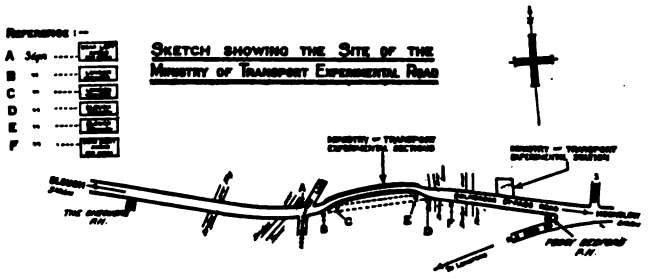
This additional cost to industrial vehicle operators as a result of an artificial speed limit if imposed, represents an additional cost on the industry of the country. If our legislators could regard it impartially in that light they would no doubt appreciate the enormity of their offence. In the case of heavy vehicles engaged on local delivery work, a quick acceleration and high speed is as important as on non-stop runs, so that every advantage may be taken of opportunity for considerable speed so as to increase the number of deliveries per day. Thus, from whatever angle the speed limit is regarded, it is expensive if the restriction is artificial, or, in other words, below the capacity of the vehicle in question.

Regarding the matter from another angle, there are approximately 75,000 heavy goods vehicles on the road. In common with other road users, no doubt, every driver is getting the best speed out of his vehicle, he is able, and if each, on straight runs, is getting an average of 25 m.p.h., should the speed limit be reduced to 20 m.p.h. representing an average of 15 m.p.h., it will necessitate about another 25,000 vehicles to do the work which the 75,000 vehicles are now doing, and thus will the roads be congested both by the additional number of vehicles required and by the ridiculously low speed enforced.

Ministry of Transport Experimental Road.

THE Ministry of Transport Experimental Road, Harmondsworth, is about 600 yards in length and lies adjacent, and parallel, to part of the Colnbrook Bye-Pass Road; its location is shown in the diagram.

The experimental sections are of concrete, with varying features of design and construction in the different slabs; the series of tests is being made in order to obtain information on technical details.



The experimental concrete lengths have been laid by the Department, with the advice of a Committee representative of all interests concerned, e.g., engineering, research, motor car users and commercial vehicle owners. It is expected that the information to be obtained from these experiments will be of considerable value.

Award for Bravery.—Under their new scheme of making awards when gallantry has been displayed in rescuing horses from death, the National Horse Association, of 12 Hanover Square, London, announces that their Certificate of Merit has been awarded to P.C. Charles S. Gowing, of Cirencester Police Station, who stopped a horse at full gallop in Cricklade Street, Cirencester, thus preventing a serious accident liable to cause the death of the horse, and probably that of many pedestrians who crowded the streets at the time. The action was carried out at some considerable personal risk, P.C. Gowing being slightly injured in the right arm.

Worshipful Company of Carmen.

Mr. J. Woodman-Smith appointed Clerk to the Company.

By the unanimous vote of the members of the Court of the Worshipful Company of Carmen, Mr. J. Woodman-Smith has been elected Clerk to the Company in succession to the late Mr. Under-Sheriff H. W. Capper, whose lamented death we reported in our issue of November last.

Mr. J. Woodman-Smith, who was born in Aberdeen, is the son of Mr. W. J. Woodman-Smith, who was a solicitor and landed proprietor. He was educated at Trinity College, Glenalmond, Corpus Christi College, Oxford and Aberdeen University; took Honours in History and Philosophy at Oxford, obtained a Gold Medal in Scottish Law at Aberdeen, gained first-class Honours in Law at the Intermediate Examination and also at the Final Examination in London, and was awarded the Cliffords Inn Prize by the Incorporated Law Society.

MR. J. WOODMAN-SMITH.

He is a solicitor by profession, and also a member of Lloyds. In addition to his legal experience, he has been a Director of Messrs. Smith & McLaurin, Paper Makers, and the Three Rivers Pulp and Paper Co., in Quebec, Canada, and has spent some years in the paper making trade in America and Canada, and has also been engaged in the catering trade.

In 1927 the late Mr. Capper was thinking of relinquishing some of his professional work, and obtained the assistance of Mr. J. Woodman-Smith. He became the Managing Clerk of Messrs. Baylis Pearce & Co., the firm of which Mr. Capper was a member, and proving successful, was admitted a partner in January, 1929.

Mr. J. Woodman-Smith was commissioned 2nd Lieutenant in the Scottish Horse in 1911, became Captain in 1914, and was appointed Major in 1917. He served in Gallipoli and in France, and retired with the rank of Major in 1919. He enlisted in the London Scottish in 1924, became Captain in 1926, and is now Commanding a Company.

He is a member of the United Universities Club, the Caledonian Club, and the Beaconsfield Golf Club. He is also a Liveryman of the Carmen's Company, his mother Company. He has a wide circle of acquaintances and friends, and the members of the Worshipful Company of Carmen, to whom Mr. J. Woodman-Smith is well known as they had the opportunity of making his acquaintance at a number of meetings of the Court during the past twelve months, should receive much benefit from his experience and energy.

Shire Horse Show. — The 1930 London Show of Stallions, Mares and Geldings will be held at the Royal Agricultural Hall, London, on February 25th, 26th and 27th next. The Programme is as follows:—Tuesday, February 25th, 8.30 a.m., judging of Stallions and Geldings; Wednesday, February 26th, 8.30 a.m., judging of Mares and Produce Groups, with Parade (if practicable) on the Wednesday afternoon, Annual General Meeting of Members at 4.15 p.m.; Thursday, February 27th, 9.0 a.m., parade of Stallions, Mares and Geldings entered for the Auction; 10.0 a.m., sale by Auction of Stallions, Mares and Geldings; 2 p.m., judging of Commercial Horses. The Secretary of the Shire Horse Society is Mr. A. G. Holland, and the Offices are at 12 Hanover Square, London, W.1.

The Road Traffic Bill.

THE Committee stages of the Government's Road Traffic Bill have been concluded in the House of Lords, and the Report of Amendments is to be received on January 22nd.

The outstanding feature of the Lords amendments is the deletion of the whole of Part V of the Bill giving powers to certain local Authorities to run public service vehicles, to enter into working and other agreements, etc.

In our last issue we said, "There is nothing in the Bill to make it easier for road transport contractors to operate, in fact, if it passes into law, the small user will most certainly be squeezed out of the business—we refer more particularly to the passenger transport side of it. It is proposed in Part V of the Bill to give local authorities powers to run passenger vehicles both in and out of their own districts by agreement with adjacent authorities. . . . The proposal requires the most careful consideration, particularly by small operating firms, as obviously it is their welfare which would be most endangered."

Speaking at a meeting of the Edmonton Labour Party, on December 19th, Mr. Herbert Morrison, Minister of Transport, said that the action of the House of Lords in striking out of the Bill the provisions giving municipalities already possessing transport powers greater freedom in the running of omnibus services raised a serious issue which would no doubt have to be dealt with when the Bill reached the Commons. This part of the Bill was essentially connected with Part IV, which set out a new organisation for the licensing of public service vehicles. Under Part IV, the municipalities would no longer be licensing authorities. They had, therefore, all the greater claim to be put in a position of complete equality with companies before the new Traffic Commissioners. Modern road transport could not be run on the basis of restricted municipal areas. Therefore, it was necessary that municipalities which already provided a very important part of the public service vehicle system, should be able to link up omnibus services with each other, to enter into working agreements with private concerns, and no longer to have to go to Parliament for the slightest extension of powers. Further, the process of going to Parliament each time an extension of powers was needed, was exceedingly wasteful from the ratepayers' point of view, and imposed additional charges upon the operation of the undertaking, which was a disadvantage to the travelling public. When municipalities bought omnibuses, their enterprise ought not to be saddled with big capital charges swallowed up in parliamentary expenses. The Bill contained ample safeguards against wasteful and irresponsible enterprise, and amply protected the general public interest. He was exceedingly sorry that the House of Lords, which up to that point had handled the Bill with understanding and businesslike despatch, had allowed itself to be influenced by narrow vested interests, and so to throttle perfectly legitimate municipal enterprise in a direction which had been recognised over and over again as desirable by Parliaments of all political complexions for many years past. As the House of Lords had been informed by Lord Russell, concluded the Minister, not only was this part of the Bill supported by the Municipal Tramways and Transport Association, but also the Municipal Corporations Association, at its annual meeting when Mr. Neville Chamberlain was in the chair, had supported the proposals, and further, the Royal Commission on Transport, which included in its ranks only two members of the Labour Party, had unanimously concurred in this part of the Bill, in the interests of co-ordination and simple justice to municipal bodies.

The Bill empowers the Minister of Transport to make regulations as to the construction, weight and use of motor vehicles, and makes it unlawful to use a motor vehicle or trailer which does not comply with such regulations. An important amendment passed by the Lords, exempts vehicles from such regulations if constructed within twelve months from the coming into force of a regulation.

The House of Lords has made several important amendments to Part IV of the Bill which deals with the regulation of public service vehicles. This part of the Bill was not to apply to contract carriages adapted to carry less than nine passengers. The Lords have altered this to read "less than eight passengers." At a recent meeting of the Omnibus Owners' Association, it was contended that these small vehicles could and did compete with omnibus and coach services, and that only contract carriages adapted to carry less than seven passengers should be outside this part of the Bill. Other speakers preferred the figure to be four or five.

The Road Traffic Bill laid down that a stage carriage should be a motor vehicle carrying passengers at separate fares, any or all of which are less than sixpence, or such greater sum as may be prescribed. The Lords have raised this amount to one shilling, or such greater sum as may be prescribed. Some omnibus owners contend that no sum should be fixed, and that a stage carriage should be allowed to ply anywhere along its route.

With regard to Express Carriages, the Bill laid down that the minimum fare should be sixpence or such greater sum as may be prescribed. As amended by the Lords, the clause now reads "one shilling for a single journey or such greater sum as may be prescribed." At the meeting of the Omnibus Owners' Association referred to above, it was suggested that the minimum fare for express carriages should be at least 2s. 6d. On the other hand, the Motor Hirers and Coach Services Association had recommended that it should be 1s., the idea being to widen the difference between a stage carriage and an express carriage. As, however, the maximum fare for a stage carriage has been raised by the Lords to one shilling, the margin of difference between the two classes of vehicles has not been widened to the extent hoped.

The Bill proceeds, "Provided that a motor vehicle adapted to carry less than six passengers shall not be deemed to be an express carriage by reason only that on special occasions it is used to carry passengers at separate fares." The Royal Commission on Transport recommended that the clause should read "adapted to carry less than nine passengers," etc.

The Bill, as introduced into the House of Lords, provided that the applicant for a road service licence, on applying for the backing of such a licence, shall submit to the Area Licensing Commissioners, time-tables of proposed regular services, and in any other case particulars as to the frequency of services and times to be taken on journeys, and that a copy of every time-table approved by the Commissioners shall be carried and be available for inspection in every vehicle used on the service in question. The Lords have amended this so as to include in each case fare tables as well.

The House made an important amendment to the clause in the Bill reading, "A local authority may make orders for determining the routes to be followed by public service vehicles in the area or in any part of the area of the authority," etc. Earl Russell moved to leave out "routes to be followed" and to insert "routes which may be used." He said that the object of the Amendment was to make it clear that the orders made by local authorities were not intended to fix routes for particular services but only to preclude the use of roads which they considered unsuitable. The orders did not have effect until the Minister of Transport confirmed them. The amendment was agreed to.

In our last issue we criticised the 30 miles per hour speed limit imposed by the Bill on pneumatic tyred motor coaches and omnibuses. The Royal Commission on Transport recommended that the speed should be 35 m.p.h. The Lords have allowed the speed to remain at 30 m.p.h. No doubt there will be a strenuous fight when the Bill reaches the Commons to get this speed increased. Lord Banbury of Southam, has given notice of an amendment to be moved on Report in the House of Lords that the speed of pneumatic tyred passenger vehicles should be 20 m.p.h.! He also hopes to retain a speed limit of 35 m.p.h. for motor cars.

Liverpool C.M.U.A.

MR. L. E. FOSTER, of Messrs. Greenall Whitley & Co., Ltd., St. Helens, has been co-opted a member of the Liverpool Area Committee of the Commercial Motor Users' Association.

The Committee, at its meeting on 12th December, discussed notices for the closing of certain roads, received from the Clerk to the Cheshire County Council. As regards the Northwich roads, the committee raised no objection to them being closed to through traffic only. It was suggested by the committee, that in the interests of through traffic, it would be beneficial if the name Warrington Road, Northwich, leading from Witton Street, was changed to some other name. It was also suggested that it would be better if "Northwich" was added to the Gralam direction arm on the signpost at Lane End Farm and Wincham Cottage. The County Surveyor and Bridgemaster of the Chester County Council sought the views of the C.M.U.A., as to the need of providing a better supply of water for steam wagons at Bromborough. The Committee is dealing with this matter. The Committee held a special meeting on 27th December to consider the Road Traffic Bill, particularly the part dealing with the limitation of working hours. Another subject discussed was the Washington Convention for the eight hour working day.

Road Engineering in relation to Road Transport.

AT a meeting of the Institute of Transport, held in London on December 9th last, **PROFESSOR R. G. H. CLEMENTS, M.C., M.INST.C.E.**, read a paper entitled "Road Engineering in relation to Road Transport."

Sir Josiah C. Stamp, G.B.E., the President of the Institute, presided at the opening of the meeting, and said that the subject with which Professor Clements would deal was a topical one, and the Institute was fortunate in having an expert to bring it before the members. Professor Clements was the first holder of the Chair of Highway Engineering, which Sir Henry Maybury had been instrumental in establishing, and he had held, at various times, high municipal offices; he had been engaged in military engineering in France; had served in an independent consulting capacity, and had taken part in scientific research, having been in charge of the appropriate department of the National Physical Laboratory at Teddington. In fact, there was hardly any kind of work along those lines which Professor Clements had not attempted, and in which he had not achieved success.

Professor Clements said that the broad and exhaustive survey upon which a Royal Commission on Transport was engaged, the prospect of legislation controlling influential industries and intimately concerning the wayfarer upon the King's Highway, and the operation throughout a decade of new social and economic agencies, all joined to make the present moment an occasion when the technicalities of road transportation could usefully be argued and ventilated.

The new conditions which were emerging in 1919 after the struggles of the Great War, witnessed the firm beginnings of an entirely new era as affecting the use and status of our national road system. The growing alteration in outlook, already well marked in the years immediately prior to 1914, had been advanced by tentative experiment and trial, and this impulse, pent up during the war period, was suddenly released, coincident with the return of the nation's energies into the peaceful channels of commerce and industry. The ten years which had elapsed furnished a convenient period for review and consideration as to the nature, extent, and quality of the progress which had been made. In particular, it furnished a reasonable perspective in which the changes, improvements, and, indeed, errors in terms both of the road and road transport could jointly be contemplated, and it was from that particular aspect of the co-ordination, nay, co-operation of those two elements, that his paper was specially directed.

UNITY OF THE PROBLEM.

The natural demand of the public for road freedom and increased road facilities had furnished to both elements an opportunity to develop along their own individual lines reasonably free from restraint or unduly hampering conditions.

In the light of this aspect of the survey, there seemed to be two outstanding questions:—

(a) Has the evolution of each element produced a closer union, based upon an appreciation of the common public interest?

(b) What steps can be taken to advance mutual progress on principles which will permit of an economic expansion?

GENERAL SITUATION IN 1919.

In 1919 the road situation might frankly be described as hopeless and chaotic. The necessary restriction of the war years, coupled with the heavy burden of war traffic, had thrown back the nation's highways into a dangerously weak condition. The highway authorities, dependent upon their own rating resources alone could not cope with the arrears of work which had accrued. Before that general state of weakness could by normal methods be improved, there occurred the sudden release of war transport for absorption into civil use, engendering a feverish activity to adapt this facility both for industrial and passenger purposes, and so creating a heavy additional traffic loading upon already over-stressed highways. The highway authorities throughout the land, unaided, would have been powerless to cope with such an appalling task as lay before them. By a wider vision and inspiration there was created the organisation to assist the local authorities of the country, the development of a clear road policy, and the formation of a Road Fund, from which the necessary additional monies for this work could be drawn. Still better, there was secured the willing co-operation of the highway authorities in the urgent work of producing a logical and progressive reconditioning of the nation's highway system.

THE PERIOD 1919—1929.

In this intervening period therefore, the principal stages were firstly, the establishment by selection—according to well defined principles—of a network of the most important trunk routes connecting the great towns and ports. These were called the Class 1 roads. Next, a series of roads of secondary importance was adopted, connecting minor towns and villages, or forming alternative routes. This network became the Class 2 roads.

The first principle established a means of providing the necessary additional revenues. The second principle selected those roads upon which, as a priority service, money should be expended.

Referring to the general changes affecting road transport in this same period the Lecturer said that first, there was the absorption of an enormous number of part-used war vehicles, chiefly in industrial transport, and next, the popularity of passenger transport by road led to the opening up of services throughout the land, and a later outcome was the long distance passenger service. The evolution of the private car had within the same period advanced rapidly.

Some future historian might justly appraise the growth of road development actually achieved in those ten years, and the basis which had been securely organised for future progress.

ROAD ENGINEERING.

The salient features of road engineering progress throughout the period under review included:—

(a) The provision, or improvement of the existing travelling surfaces on the principal roads.

(b) The widening out and abolition of some danger points.

(c) The strengthening of weak foundations and haunches, and the general elevation of the standard of surface paving by the use of the more permanent and lasting types of construction.

(d) The reconditioning of important trunk routes. Those sections of the work which had been completed, though relatively small and discontinuous, had proved a great advantage. This class of work had involved the creation of entirely new standards both of construction and of designing, and would form a valuable guide to all future work in this country.

(e) In many cases the existing roads, by reason of over development along their length, or the general impossibility of adaptation to a higher standard, had to be abandoned and replaced by an entirely new road, roughly paralleling the old line. In addition to this, there were very many miles of new roads constructed to give improved means of outlet from great towns. It was, perhaps, appropriate here to voice a note of regret that in too many of these instances, especially in the case of works on the fringes of the great towns, the new road planned and constructed as a traffic artery had been seized upon to form the backbone of a new housing growth, and there could be witnessed within a few years of its creation, the conversion, and therefore deterioration, of this traffic artery into the condition of a town street, with all its attendant disabilities of trench openings, stationary vehicles, pedestrian traffic, and similar added dangers. It was a matter of the greatest regret that steps were not taken to ensure that the traffic value of this type of road should not be lost so soon after its creation, and that the necessary building development had been sited at nodal points, away from, but in reasonable proximity to, the line of the road and so conserving its function as a traffic artery. In this connection alone, the powers given to County Councils and their Engineers as Town Planning Authorities under the Local Government Act, 1929, would be of far reaching importance.

(f) In most of the large provincial towns the old tortuous, or illogical grouping of the civic centre, together with narrow congested shopping streets had called for the rapid development of the bye-pass as a means of affording the necessary relief for through going traffic. In most cases, while this did in fact involve a detour of greater geographical distance, the time saved by reason of higher speeds and absence of delay and interruption more than justified their construction in

Digitized by Google

almost every case. The bye-pass scheme, to be fully effective, should be designed and planned not only for the immediate present, but to make provision for the future.

(g) Scheduled Rural Roads. Rural roads did not initially appear to have a special significance, but motor traffic was threading its way along all roads, and eventually a series of scheduled rural roads of lesser but definite traffic value was selected, and the policy of their improvement and modernisation was formulated.

(h) Upon many English highways there had continued to exist a restraint of passage in the shape of a private toll or similar local obstruction, and it was natural that attempts should be made to remove by purchase or otherwise those impediments to progress. Much had been done in this direction.

(i) Bridges over rivers, canals, railways, etc., presented a peculiarly difficult problem. Designed at the time when, say, the horse-drawn wagon was the unit of traffic, and when loading and speed of movement was determined by that standard, it was not surprising to find throughout the country that there was an enormous number of bridges too weak to support the traffic of the present day. Much work had been done in reconditioning those bridges which were public property, but in the case of those belonging to railway, canal, dock, and other statutory companies, a natural difficulty arose in any proposal to relieve them of their statutory obligations. Nevertheless, a way had to be found which should abolish the illogical condition of imposing, in the year 1929, a standard of traffic which obtained 100 years ago, and already a more enlightened and proper policy was being pursued.

Study and interpretation of the records of density and traffic growth was one of the principal factors which should control not only design, but the quality of economy in expenditure upon which all good design was based.

Densities varied greatly throughout Great Britain over a wide range, and especially upon the same road, but many roads in the provinces carried a loading well in excess of 25,000 tons per day. The rate of increase between 1922 and 1925 frequently reached 300 per cent. under widely varying conditions. The rate of increase between 1925 and 1928 was generally less pronounced.

ROAD TRANSPORT.

During the decade there had been an equally vigorous transition and development in the design and the utilisation of road transport. Haulage transport had achieved its own distinctive technique, and its economic radius of action, together with increased speed and size of unit loading had been enlarged, the latter greatly facilitated by the six wheeler. As to this latter innovation, road engineers were still divided as to whether that was from their standpoint a blessing or otherwise. They were more unanimous on the advantages which had accrued to the highway—and especially to its foundation—from the adaptation of the pneumatic tyre for commercial and industrial vehicles, and the larger passenger units. The recent adoption of such tyres had undoubtedly reduced the stress of road maintenance, the value of which was paralleled by a corresponding advantage to the vehicle in maintenance, speed, operation, and passenger comfort. An excellent example of the virtues of co-operation!

The systematic extension of passenger transport services had brought in their wake order and regularity of duty, improved comfort expressed in design by low loading, lowered centre of gravity, better seating accommodation, and all-weather bodies. Indeed, in the case of the long distance passenger services, these had attained a very high degree of luxury and efficiency.

It would be only too patent that in the general case the reconstruction or adaptation of roads and bridges had followed some long way after the traffic had created a demand, and thus arrears of work and improvement must exist for a long time to come. The desire, no doubt economically justifiable, for greater speeds and wider facilities and higher loading could go too rapidly, and some restraint was necessary and desirable to enable those arrears to be overtaken, and to guard against, on the other hand, a fatal tendency toward over development.

Referring to road accidents, Professor Clements said that in this vital sphere true reform should come from within, and not from the enforcement of artificial regulations. It would not suffice to evade responsibility by throwing the onus upon other shoulders. It was too intimate and personal a matter, and should be accepted as the equal individual responsibility of every user of the road. The fallacy of looking for reform by means of an Act of Parliament alone was merely deliberately avoiding the issue, and equal to the thought which sought to place the blame elsewhere.

There was no more distressing condition for the road engineer than to find that his best labours in improving communication by road might through misuse or abuse result in accidents which ought never to arise. At the same time he must still seek every means and device whereby the thing he created could be made more safe and convenient, and that it should be so designed as to leave no doubt in the mind of the user of the nature of the road conditions he was approaching.

ROAD SIGNS AND SIGNALS.

Multiplicity of road signs and warnings was more dangerous than a lack of them. What was required was the most terse, brief, and emphatic statement of the conditions of fixed or potential danger, both by day and by night. One of the earliest and most vital improvements required, and which would have a definite value in reducing accidents would be a complete and systematic establishment of standard road signals, to the exclusion of every other distracting or supplementary statement upon or adjacent to the highway of whatever nature or description.

TRAFFIC CONTROL.

Linked up to the foregoing was the need for a co-ordination and simplification of the various devices which had been adopted and were in operation throughout the country by various traffic authorities. Whilst these might not have the same fatal consequences, it was, to say the least, disorderly to have so many varied systems through which traffic had to muddle. One might feel confident that the regulation of traffic control to a common policy and of road-side signals would so clear away many difficulties that traffic would itself proceed to the next step of obeying those directions in an orderly and consistent manner to the great advantage of all users of the highway.

LEGISLATION.

The present position of legislation under which vehicles moved and had their being was truly dangerous, and it was submitted that the developments of the last ten years, provided a safe guide for an Act which would regulate present day practice without unduly restricting future developments.

THE REQUIREMENTS OF THE FUTURE.

Continuing, Professor Clements said that without adopting in any degree the unwise and thankless role of prophet, there were certain clearly defined principles which should supply an index for the immediate future. Traffic control, for example, should be systematised throughout the country. Road signals should be standardised, and weeded out to give absolute warning and guidance only. In towns there should be established one or more properly designed and centrally sited parking stations for long distance passenger traffic, and the principal motor bus stopping points should be designed not only with regard to other traffic using the highway, but should provide light weather protection for the waiting passengers.

Important changes would no doubt follow from the intervention of the railway companies equipped with their new road transport powers. The public convenience and advantage should still be a paramount consideration, and it would be of great interest to observe this new factor in operation. In this direction also the work of the Royal Commission on Transport would be expected to produce advantageous results along the lines of the co-ordination of all transport operating in well defined areas.

As to the future of the vehicle itself, there were still many directions in which progress could be made to its own advantage, for example, by reducing stress and wear upon road surfaces and foundations, and completing the cycle, in turn, so reducing the cost of road user to the vehicle. Factors of this character were improvements in spring design, reduction of unsprung weight, and modification of the clutch and gear-box with the reduction in road stresses which arose therefrom.

In another sphere, improvement was required for the housing and fitting of the fuel tank, which was too frequently a most vulnerable part of the machine. Changes, of course, were foreshadowed in the design of the prime mover itself, and of its fuel. Highly efficient as the present petrol engine had become, the designer—in his quest for efficiency—could be expected to produce still more valuable results.

The road in its turn must likewise face a continued need for improvement and progress. Vision and imagination could play a full part in sweeping away those factors which hampered co-ordination, and retarded real broad advance. The design of special features required further study, such as road junctions with their attendant dangers, and the greater use of over-bridges, the removal of level crossings, and the strengthening or reconstruction of

Digitized by Google

weak bridges, especially that large number for which statutory companies were legally responsible.

Moreover, the establishment and steady pursuit of a definite reconditioning programme for the trunk roads of the country should be a matter of accepted public policy and advantage, and be steadily pursued up to the limit of reasonably financial availability.

Finally, there should be a more whole-hearted appreciation and utilisation of the advantage and ultimate economy of well conducted scientific research, devised to solve and assist the countless technical problems arising in relation to road engineering, and the use of roads.

By co-operation and help the road engineer and the transport user could freely exert their labours to the common good of the public at large.

The Discussion.

Colonel C. H. Bressey, C.B.E., said that the Author had referred in several passages to the need for a higher degree of standardisation in the methods adopted for road construction, especially on the more important roads. Everyone would agree as to the soundness of that view. The British Engineering Standards Association had played a considerable part, in collaboration with the Ministry of Transport, in framing specifications applicable to various forms of surfacing. In addition negotiations were proceeding between the Ministry of Transport and the societies representing the County Surveyors and the Municipal and County Engineers for the drawing up of a general recapitulation of the methods adopted in the best counties, in order that it might be circulated amongst local authorities generally throughout the country. By this means it was hoped that the level of the less advanced counties might be brought up to that of the most efficient. In any task of this kind the Ministry, he knew, would always be able to rely on the technical assistance of the Author of the paper.

Mr. H. T. Chapman said the Author was responsible, if not for the initiation of the scheme of arterial roads in Kent, at all events for its execution. He desired Professor Clements' opinion in regard to two-way traffic. There was a danger in such traffic, and a danger in central carriageways in the same connection. He believed there were more accidents on the Great West Road and the wider arterial roads than on any others. Where the roads were divided into two, there was, with the seasonal traffic, considerable difficulty owing to congestion. By the Act of 1929, unclassified roads would be under the County Councils. There were already Class 1 and Class 2 roads, and, in addition, a large number of others; he was not sure whether it might not be essential to have a further classification of roads which were not at present classified. It might be necessary to have "C" and "D" roads, in order that efforts might be concentrated on what he would describe as the more important of the lesser roads.

Mr. W. P. Robinson said that an important point in the paper was that which drew attention to the building development that proceeded after the construction of new roads, and he was not sure that the powers of the highway authorities to control development would, even under the new 1929 Act, be adequate, but he hoped that under that Act by giving the County Councils further town-planning powers, it would be possible to obtain more control over this ribbon development and over scattered development also. It seemed to him that the town-planning powers of County Councils did require amendment, and possibly might have to be increased. He felt that the control of traffic was likely to be a difficult problem. It was the intermingling of slow and fast-moving traffic which often was the cause of delay and accidents. The Road Traffic Bill seemed to be a step in the right direction. Probably the most important point to which he wished to refer was that of scientific research. He hoped that something might be done to prevail upon the Government to be more sympathetic and provide more money than had been voted in the past for this particular purpose.

Mr. H. H. Gordon said that economic use of the road was incompatible with haphazard going either on the part of the pedestrian or the vehicle owner. Therefore, in part, at least, desire for economic user of the road must be dictated by a proper system of traffic regulation. He ventured to say that road engineers could not do better than, at all events, pay some attention to the lessons and experience which had been learned with regard to the economic use of the track in railway practice. From railway practice he would learn that the proper way of crossing was by over-head bridges and not on the level; he would learn to have flying junctions, and not gyratory systems. The gyratory system in London streets might conceal for the moment the fact that the streets ought themselves to be improved, but, in the long run, gyratory practice would prove as unsatisfactory in street traffic in London as it would prove on a railway. The road and the railway each had its definite purpose to serve, and although the principles of construction of road and railway might be the same, yet the definition of user of the two must be entirely different. He did not think the country could afford the luxury of two systems which were identical and merely competitive, and he echoed the remark which had already been made that there was most urgent need for greater scientific research along the lines which the Institute, in particular, was framed to develop. The research he had in mind was not so much with regard to the construction of roads, which was purely a problem of engineering, but it was with respect to the proper uses to which roads and railways should be put. There was a definite purpose which the road and the railway each had to fulfil, and until their minds were clarified as to the purposes which each had to serve, it was impossible to define exactly what further need there was for road accommodation and what form that accommodation should take.

Major F. C. Cook said if he were asked what was the most important matter in new road construction to be dealt with, he would suggest that it was ribbon development. The remedy, he thought, would rest in the manner in which the County Councils, which were primarily concerned, applied themselves to the problem in the light of the powers which they would enjoy under the Act of 1929. He was very glad to hear the reference which the Author made to the necessity of close co-operation between the road maker and the vehicle manufacturer. There was a very definite relation between the two. The road reacted directly on the class of the vehicle which used it, and the expense of running a particular vehicle must depend in a very large degree upon the character of the road on which it ran. Speaking as a road engineer, he thought that owners of some classes of vehicles occasionally forgot that owing perhaps to some fault in design, or still more to the conditions to which it had been allowed to deteriorate, a vehicle might do more damage to a road within a given period than the value of the vehicle itself. Dealing with the complaint so often made of competition between the railway and the road, he would like to say that, so far as the road engineer was concerned, there was no question in his mind of competition with the railway, or with any other form of transport. The question of competition when it arose was a matter not for the road maker, but for the road user. To his mind—he thought to all their minds—those who were concerned with the administration of public money on highway expenditure were convinced of this fact, that not only the railway and the road, but the river and the canal each had its proper part to play in the problem of transport, and that a wise administration, whether national or local, would have regard to these considerations and shape its policy to that end.

Major E. G. E. Beaumont, O.B.E., said that the Author had touched upon some important matters, including the urgent necessity for establishing a definitely understood system of road signals and the improvement of road customs, so that there might be a reduction of the slur that there was at present upon mechanical transport, in view of the unsatisfactory frequency of accidents. The Author's statement regarding the substantial progress made in dealing with bridge schemes during 1928-29 was reassuring and active progress of the reconstruction work required all encouragement. While the extended use of pneumatic tyres constituted an excellent example of mutual help in relieving wear and tear of both vehicles and roads, improvements in design, tending towards reduction of axle loads and impact stresses upon the roads, so far as high capacity vehicles were concerned, were to be expected. Higher permitted speed of travel of trailer vehicles would lead to their more frequent use in the future and would assist in the relief of the roads.

Sir Henry Maybury, G.B.E., K.C.M.G., C.B., said that whilst agreeing with Mr. Gordon that there was the economic side to the road question, and naturally anyone dealing with the matter economically, from a national standpoint, must, as Major Cook had stated, have regard to other forms of transport; still, one was apt to lose sight of some of the advantages, other than traffic, which the road afforded to the community. He wondered how the housing situation could have developed had it not been for the net-work of roads which those engaged in housing were fortunate in finding available. Take the case of one of the new arterial roads. He was optimistic enough at one time to predict that on one particular road, if it were built, there would be thousands of houses erected in a very short time. He had lived to see that road

Digitized by Google

constructed, and over a length of about eleven miles there were now between four and five thousand houses erected adjacent to it.

Professor Clements, replying to the discussion, said that Col. Bressey had pressed for higher standards of road work. That required no pressing beyond this point, that to every engineer who laboured in any particular field of work which served his fellows, the pursuit of a higher standard was at all times engaging him. Mr. Chapman had put to him the problem of the two-way road. That was a problem which, like many other things, could only be settled by the consideration of the facts bearing upon the case in point. It was a question about which there could be no generalisation. It was impossible to say that a one-way traffic road or a two-way traffic road was going to be of universal application. Each treatment was appropriate to its own special conditions. Mr. Robinson had touched on a point in regard to which he felt very strongly. He had spoken from his own experience of the devolopment along the new public highways. The speaker did not think he had put it too high when he said that it destroyed the traffic value of the new artery. The authorities now entered upon certain new powers and duties under the Local Government Act, 1929. Careful planning, whether town-planning or regional planning, beforehand, could do much to reserve to a road its proper function as a traffic artery, and here again he would press for a solution along the lines of the development of nodal points adjacent to the traffic artery. Much could be done with the aid of a small loop road in the way of conserving to the use of the public the traffic artery for the purpose for which it was designed and created. He quite agreed that standard signs would not prevent accidents. Nothing would prevent accidents except the appreciation on the part of all users of the highway of the danger of such accidents and of the duty and obligation upon all to exercise care, caution and courtesy. The road engineer had borrowed freely from railway engineering practice, but the speaker thought he might say that he had borrowed those things which were useful and which could be preserved. He did not want the road engineer to borrow those things which were best left in the sphere of railway engineering.

Parliament and the Roads.

A WELL attended meeting of members was held in the House of Commons, recently, under the Chairmanship of Major Walter Elliot, to consider questions connected with the development and improvement of roads and bridges.

A valuable initial step in the direction of considering roads apart from the sphere of party politics was taken by Sir Edward Iliffe, Hon. Treasurer of the Roads Improvement Association, and, following Sir Edward Iliffe's resignation from the House, Major Elliot had interested himself in the matter.

After a short discussion, a Roads and Bridges Committee of the House of Commons was formally constituted. Major Walter Elliot was elected Chairman on the proposal of Mr. George Dallas, seconded by Col. Sir K. Vaughan-Morgan. Major Lloyd George and Mr. J. H. Palin were elected Vice-Chairmen, and Mr. D. J. Vaughan, Hon. Secretary to the Committee.

The membership of the Committee is at present as follows, with power to add:—

Capt. E. N. Bennett, Mr. D. Chater, Mr. J. Compton, Mr. G. Dallas, Mr. J. Chuter Ede, Major W. E. Elliot, M.C., Mr. J. E. Edmunds, Mr. Peter Freeman, Major Lloyd George, Mr. D. R. Grenfell, Mr. F. Kingsley, Mr. A. G. Gossling, Mr. D. Hopkin, Mr. Griffith, Mr. P. A. Harris, Mr. L. Hore-Belisha, Lt.-Com. J. M. Kenworthy, Mr. W. T. Kelly, Sir J. Lamb, Sir Murdoch MacDonald, K.C.M.G., C.B., Capt. P. MacDonald, Lt.-Col. Cecil Malone, Mr. W. Mansfield, Mr. G. Middleton, J.P., Mr. J. H. Moses, Mr. H. T. Muggeridge, Sir Douglas Newton, K.B.E., Rt. Hon. Major W. Ormsby-Gore, Mr. J. H. Palin, Mr. M. Philips Price, Sir Cooper Rawson, Mr. W. R. Raynes, Mr. L. de Rothschild, Mr. A. A. Somerville, Mr. D. J. Vaughan, Mr. J. Walker, Mr. W. Whiteley, Mr A. Smith, J.P., Mr. W. B. Taylor, Col. Sir K. Vaughan-Morgan, C.B.E., Lt.-Col. Watts-Morgan, D.S.O.

The following Sub-Committees were elected:—

(a) *Road Fund Administration and Unemployment.* — To take such action as may be necessary to accelerate the early commencement of carefully selected road and bridge work, and to watch that it is carried out under sound financial and administrative conditions. To make recommendation as to any fundamental changes in procedure desirable to achieve these results. (Convener—Mr. D. Chater).

(b) *Road Transport Legislation.*—To consider and report upon legislative proposals when introduced, and to make recommendations as to any amendments desirable. (Convener—Sir J. Lamb).

(c) *London Traffic—London Bridges and Tunnels.* — To consider questions connected with the provision of adequate facilities for the increasing traffic in London and the Home Counties. (Convener—Mr. A. Smith).

(d) *Bridges: Level Crossings: Motor Ways and Toll Barriers.*—(1) To investigate and take such action as may be necessary to promote or facilitate the negotiations with the public service companies concerned to enable weak bridges to be reconstructed and bridges substituted for level crossings. (2) To investigate and report upon proposals for the construction, at the whole cost of the Road Fund, of roads reserved specially for motor traffic. (Convener—Capt. P. MacDonald).

(e) *Co-ordination of Road and other forms of Inland Transport.*—To consider and make recommendations upon all matters relating to the co-ordination of transport. (Convener—Mr. George Dallas).

(f) *Roads in Dominions and Colonies Overseas.*—To secure the development of roads and motor traffic in countries for which Foreign, Colonial and India Offices are responsible to the House. (Convener—Maj. the Rt. Hon. Ormsby-Gore).

(g) *Road Design and Lay-Out: Road Signs and Signals.*—(Convener—Sir M. MacDonald).

Mr. Rees Jeffreys, Chairman of the Roads Improvement Association, in response to a request by Major Walter Elliot, reviewed some of the more important features connected with road development that would need serious and urgent consideration. He recalled the days before the advent of the Road Board when is was not possible to raise any question concerning roads in the House, as the Speaker ruled that Roads were the responsibility of Local Authorities and outside the purview of Parliament. The situation was different to-day. The State were paying a very substantial share of the cost of the maintenance as well as the improvement of the roads, and Parliament had a very definite duty to see that this expenditure was wisely and beneficially administered.

The Roads Improvement Association were willing to place Secretarial facilities at the disposal of the Committee, with the use of all its records, to enable the work of the Committee to be of the greatest value. Mr. D. J. Vaughan, M.P., had kindly consented to act as Hon. Secretary to the Committee.

Major Walter Elliot thanked the Roads Improvement Association for this help which the Committee gladly accepted. He pointed out how valuable this would be, as Members were unable to devote time exclusively to this important question: the co-operation of a great standing organisation, which had been in such close touch with road questions in all their phases for forty years, would be invaluable. It was only on the assurance that this assistance would be forthcoming, that he consented to undertake the Chairmanship of the Committee.

At a subsequent meeting of the non-party Roads and Bridges Committee of the House of Commons, Major Walter Elliot, M.P., presided.

Memoranda submitted by the Roads Improvement Association, dealing with various questions connected with road development and administration, were considered.

Particular attention is to be given to the acceleration of the actual commencement of road work. For some time now there have been numerous reports and statements regarding the volume of work that has been approved and authorised, but relatively little has actually been started. The Committee intend to emphasise that more attention should be given to the design and lay-out of roads, and point out that although improvements in the road vehicle have during the last thirty years been revolutionary the design of the track used by the vehicle has remained largely stationary.

It is felt that the development of road amenities is of the utmost importance and should receive the same executive attention as is now devoted to the construction of the actual carriageway and footpath. The Minister of Transport is to be invited to take the initiative in the systematic removal of dangerous corners and curves and in the reconstruction of weak bridges and the provision of new bridges for level crossings. This is a class of useful work that could be developed side by side and without interfering with general road development now being negotiated by Local Authorities.

Specialists in Multi-Wheeled Transport.

As operators of a fleet which includes 35 multi-wheeled vehicles, M.R.S., Ltd., of Preeson's Row, Liverpool, have built up a traffic organisation which is one of the finest in the country. Their total fleet of vehicles comprises about 70 units (including maintenance cars) the main constituents being Scammell six and eight wheelers, seven being six wheelers of 12/14 tons load capacity, 26 eight wheelers to carry 15/20 tons and 2 eight wheelers to carry 25 tons. Their resources also include five traction engines of the Fowler and of the Aveling and Porter type, together with a vast quantity of tackle necessary for the transport of heavy machinery, boilers, cranes, etc.

At the present time M.R.S., Ltd., have under construction an entirely new type of Scammell with multi-wheels capable of supporting a load of 40 tons. Another unit on order is a 14-wheeled machine to carry 100 tons. The motive unit will be similar to that of the present eight wheeler with the exception that it will be enormously geared down. From behind the engine, two exceptionally large steel pressings fall from the turntable and carry the front part of the platform which is constructed of built-up steel girders. There are two carriers, one of which has a platform length of 28 feet with a loading line of just over two feet from the ground. When this unit is employed there will be front steering wheels, four wheels in a line on oscillating axles under the turntable with two differentials. At the rear end there will be four wheels in a line, and immediately behind these there will be another set of four wheels, each set of four mounted on two short axles, so that the wheels oscillate and fit the camber of the road, each taking its due share of the load. The machine will have rubber springing, and four jacks will be built into the machine to permit of the whole of the platform lowering to the ground to expedite loading and off-loading, the axles and wheels being detachable. The other unit with a platform length of forty-one feet is similar in construction, with the exception of the last four trailer wheels. Owing to the total overall length of this carrier, back-end steering is essential and only four wheels are practical for this. There will be a four foot capstan wheel at the back, operated by two men seated at this end. The total length of this lorry will be 68 feet.

Another very interesting machine on order is a 35-ton Foden steam wagon. It will run on fuel oil and will incorporate several entirely new features.

M.R.S., Ltd., have depots at London, Manchester, Leeds, Birmingham, Newcastle-on-Tyne and Sheffield, and they have arrangements with a large number of sub-contractors in all parts of the country who collectively transport about two-thirds of the total average traffic. That is to say, the M.R.S. fleet as a separate entity, undertakes about one-third of the daily gross tonnages, and hired vehicles the remainder. Some of the sub-contractors are subsidised by M.R.S., Ltd., being financed in such a way, that when called upon, they can render the quality of transport service that is expected by, and of, the firm. Thus the order in which loads are allocated is as follows:—(1) the house fleet; (2) subsidised haulage contractors, and (3) other haulage contractors.

In the branch of business devoted to the transport of heavy engineering manufactures such as electrical plant, locomotives, cranes, girders, boilers, etc., in addition to the five road locomotives capable of hauling loads up to 100 tons, a vast quantity of tackle has to be employed. The firm's equipment includes 22 bogeys of various types for loads of ten tons up to 100 tons. Contracts, so far as they relate to boilers, more often than not, cover seating as well as carrying, but as a rule every job is a law unto itself and has to be dealt with on its merits according to the weight and size of the pieces for transport. The weight of the load, excepting when canal and railway bridges have to be traversed, is not the first anxiety. The main problem is the size of the pieces and the difficulty of loading, securing to the vehicle and afterwards lightening same. When awkward loads have to be taken long distances, it is necessary to make a preliminary road survey in order to avoid difficulties that might prove formidable obstacles.

One of the contracts recently executed was the conveyance of a Pullman coach from Nottingham to Glasgow. The length of the Pullman was 57 feet, and the height when loaded over 16 feet. Every road en route had to be well thought out and cars worked about 30 miles ahead of the job, finding bye-roads to avoid overhead bridges and road bridges governed by weight restrictions. In this case, two bridges close to Glasgow were encountered, there was no way round, and the coach was too high by inches for an overhead bridge. The only course open to the contractors was to take up the surface of the road under the bridges to get sufficient clearance. Of course they had to make the surface good afterwards. The trailer employed on this job had 16 wheels all with rubber tyres and roller bearings. Another exceptional job recently completed was the transport of four hammer blocks from Yorkshire to the Midlands. Each block weighed 65 or 71 tons. Prior to these pieces going on to the job, one had to be removed to another foundry three-quarters-of-a-mile away. A local contractor tried to move one of the blocks with four traction engines but failed and then commissioned a fifth. Yet with the type of bogey and tackle used by M.R.S., Ltd., on the journey of 100 miles, their largest engine was sufficient to do the haulage alone with a small engine in the rear to hold back the load when going downhill. This journey of 100 miles was completed in 27 hours running time. The total weight of each block, tackle and trailer was 88 tons. The engine weighed 17½ tons so that the total pull was 105 tons.

The most noteworthy work takes place on arrival at the site where usually the loads have to be taken off by tackle carried on the locomotive and placed in position. Recently, M.R.S., Ltd. transported a boiler measuring 16 ft. 9 ins. high, when loaded, and 17 ft. in diameter, weighing 50 tons, from the North-East Coast to Banbury, near Oxford. It had to be loaded on the flat, took up 17 feet of the road, and obviously completely filled many of the roads, 290 miles of which had to be traversed. It did not clear at least five bridges in transit, and had to be taken off the trailer and rolled under the bridges on rollers, and afterwards

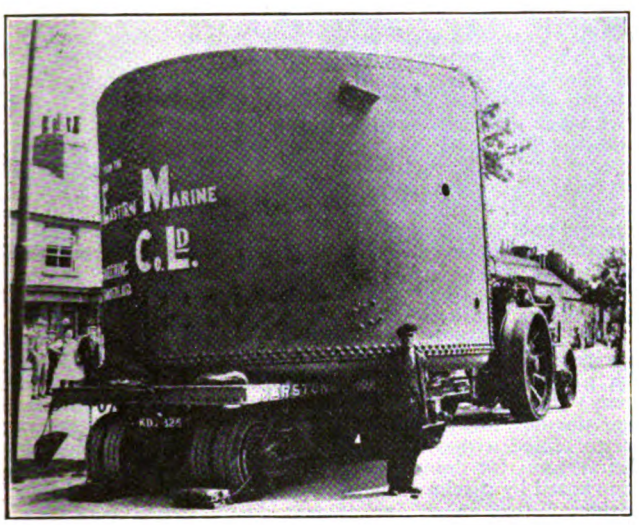
LEFT: A 32-TON SENTINEL-CAMMELL STEAM RAIL CAR BEING TRANSPORTED FROM NOTTINGHAM TO GLASGOW ON A 16-WHEELED EAGLE TRAILER. LENGTH OF LOAD, 57 FEET, HEIGHT WHEN LOADED, 16 FEET. RIGHT: ONE OF M.R.S., LTD. SCAMMELL 8-WHEELERS WITH A RUSTON & HORNSBY EXCAVATOR "ON BOARD."

Digitized by Google

re-loaded. One can imagine the tremendous task of unloading the bulk and weight on the road, and taking by hand under the bridge, and putting back again. On arrival at the site it was necessary to build a sleeper track over 250 yards long across some allotments, where the ground fell by 1 in 6, and wind the boiler by means of the engine down this track, finally placing it on to its prepared seat in the works.

Boilers, loco cranes, excavators, and such like heavy and large loads are done regularly in considerable quantities, every week by the Company, and as many as 28 contracts of heavy boilers and lifts have been going on at the same time. Each of these were lifts of over 25 tons each. At one time cranes and excavators were mainly forwarded in parts, but now the complete unit can be built up at the works and forwarded in a finished state ready for erection on reaching the destination, the Company undertaking the erection if required. The same practice is followed in regard to the dispatch of locomotives. The transport of girders and constructional ironwork is another important section and the Company undertakes erection.

M.R.S., Ltd., claim to carry anything, and during the last few months on the general transport side, substantial developments have taken place in the quantity of tonnage handled. Every day there are about 100 journeys be-

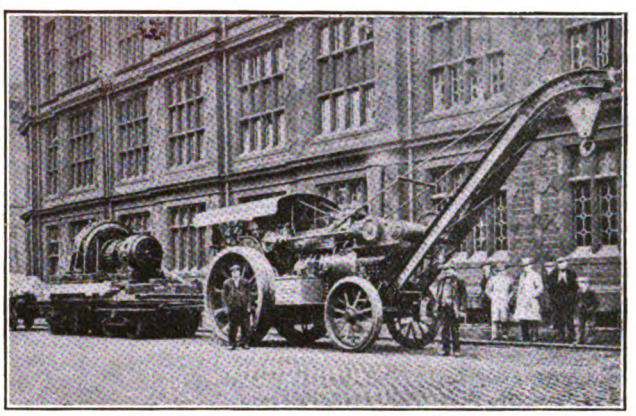


TRANSPORTING A 70-TON BOILER FROM SUNDERLAND TO BANBURY ON A 16-WHEEL TRAILER.

tween such places as Liverpool, Manchester, Leeds, Birmingham, Sheffield, Newcastle and London, which are the trunk routes. On one contract alone M.R.S., Ltd., carry about 1,000 tons per week. All the vehicles work a 24 hour day, outward goods going forward by night and return journeys made in the early hours the following day. In summer, journeys of about 100 miles commence about 9 p.m. and in winter at 6 p.m., and earlier for long distances. Generally speaking the departure time is adjusted to the hour at which the goods have to be delivered. Mileage is a secondary consideration and distances up to 200 miles are regularly undertaken. The various depots arrange for back loads. Each Scammell lorry is expected to earn a minimum of £12 per day irrespective of the mileage travelled. The average earnings per vehicle during a recent six months period was £58 19s. per week, but one of them during the week previous to our interview, earned no less than £135, and during the subsequent week was expected to even improve upon that excellent figure by touching £175. Results such as these can only be achieved by a great deal of intensive organisation and the close co-ordination of country depots with headquarters. The multi-wheelers are hired mainly on a time basis of 24 hours, and not on mileage, that is to say, that at the rate quoted the vehicle must be back at headquarters, or at a depot in time for the next outward load, the following evening. Considerable reliance has to be placed on the efficiency of driving staffs and, consequently, all drivers and assistants participate in a bonus scheme which is operated according to the following scale:—When the earnings of a multi-wheeled vehicle are between £55 and £60 per week the driver receives £1 and his assistant 10s.; £60 to £65, driver £2, assistant £1; £65 and over, driver £3, assistant £1 10s. Drivers are not called upon to look for traffic, which in its entirety, is sought out by the depot staffs. It is not uncommon for 33⅓% of the multi-wheeled vehicle drivers to earn a bonus. In addition to this, each driver qualifies for a supplementary bonus of £10 if he completes six months work without complaint.

M.R.S., Ltd., specialise in bulk traffic which may be analysed thus:—From Birmingham, iron sheets, machinery, tools, and metal goods generally; from Leeds, machinery; from Manchester, carbon black, extract, machinery, chemicals, timber; from London, tea, rubber, machinery, twine, fibres, pulp and paper, copper ore (M.R.S., Ltd., transport 50% of the tea that goes into Yorkshire); from Newcastle, iron plates; from Liverpool, general import cargoes. Loads are generally multiples of 20 tons, and as the capacity of the fleet is only one third of the total average traffic offering, it will be seen that there is a good residue of small loads (of four to eight tons) available for haulage contractors who receive the price of the job less ten per cent less two per cent. insurance. All loads are covered by a floating policy at up to £2,500 per week with liberty to increase on declaration.

In view of the great electrical developments that have taken place in all parts of the country, M.R.S., Ltd., handle much of the transport of drums of electric cables. Where the work is of good continuity, a traction engine with crane attachment is dispatched to the site to unload the drums of cable from the multi-wheeled lorries. As to operating costs of the Scammell lorries, the average approximate details are given, based on experience over a long period:—Drivers and assistants wages, £8 10s.;



ONE OF THE TRACTION ENGINES FITTED WITH A CRANE TO ASSIST IN LOADING AND UNLOADING OPERATIONS.

drivers and assistants bonus, £3; tax and insurance, £1 10s.; repairs and maintenance, £3; tyres (six wheelers), £3; tyres (eight wheelers), £3 5s.; drivers expenses, £3; oil and petrol (when the vehicle is earning £10 per day), £9; depreciation 20% per annum, £6 5s.

Perhaps it should be necessary to explain here that the maintenance department observes the same high standards of efficiency as the traffic department. By operating a fleet of uniform types of machine, the interchangeability of parts when necessary, is considerably facilitated. M.R.S., Ltd., ideal is to get a full day's work from every unit they employ, and consequently adopt the unit system of repairs and maintenance. Spare engines, gearboxes, axles, wheels, etc., are always available for changing over immediately should any of these units fail. A spare engine can be fitted to replace one now installed in about five hours. Thus no earning time on the lorry is wasted. Work proceeds on the old engine in the repair shops whilst the lorry is working and earning.

Overhead expenses are allowed for at about £5 per machine per week which is considered ample, having regard to the size of the fleet and the big quantity of traffic handled by hired vehicles. It is the policy of M.R.S., Ltd., to renew the Scammells after three years work. They do all their own repairs and maintenance, and each of their own lorries is reconditioned after about 18 months service. The chief garage, where all maintenance work is done, is situated in Lightbody Street where is installed a modern plant of machinery suitable for executing any class of repair work —to engines, chassis bodies, etc.

Members of the maintenance staff have at their call a group of nine private cars so as to be able to promptly render assistance if any of the revenue earning machines encounter trouble on the road.

National Traction Engine Owners' and Users' Association.

A HAPPY feature of the Annual General Meeting of the National Traction Engine Owners' and Users' Association, held at the Agricultural Hall, on December 12th last, was a presentation made to Major G. W. G. Allen, M.C., M.Inst.T., the Chairman of the Association.

The first business was the election of the President, Rt. Hon. Viscount Brentford, P.C., this being carried with acclamation after eulogistic speeches by the proposer and seconder. Mr. John Allen, O.B.E., J.P., was unanimously re-elected Vice-President, and a fine tribute was paid to his great services to the trade. The Vice-Chairmen, Messrs. N. E. Box, F. M. Elgar, J. Falconer, N. H. Gotobed and G. Thurlow were re-elected, and the Committee was re-elected with the addition of the names of Mr. A. R. Oliver and Mr. A. D. Currie.

Viscount Brentford, who received an enthusiastic reception, rose to present a magnificent rosebowl to Major Allen for his splendid services to the Association as Chairman, and particularly for his work in giving evidence before the Royal Commission on Transport. In doing so, Lord Brentford said that he had been fighting their battles in the House of Lords, and he had to get back at once as the Road Traffic Bill commenced its committee stage that afternoon. Major Allen expressed his thanks for the beautiful gift in a few well chosen words. After Lord Brentford had left Major Allen proceeded to enlarge on matters mentioned in the report which has engaged the attention of the Committee during the past year.

In the Report for the year ending 30th September last, which was adopted, it is mentioned that the past year had been an important one, and a number of matters of very great interest to Members had come before the Committee.

It was satisfactory to note that in the First Report of the Royal Commission on Transport, some of the most important of the suggestions put forward by the Association had been accepted, and some very important points gained, and the Committee felt that the grateful thanks of the Association were due to Major Allen for the excellent work he had done on behalf of the Trade generally. He had given much time and thought to the preparation and giving of his evidence before the Commission, and there was no doubt that it was bound to influence the new draft of the Road Traffic Bill greatly to the benefit of Members of the Association.

The Ministry of Transport had issued new regulations with regard to excessive noise, and the Committee desired to draw the attention of Members to those regulations, copies of which could be obtained from the Secretary, and they would recommend that all possible care should be used to prevent unnecessary and excessive noise.

The Bridges Act, 1929, was now on the Statute Book. The Committee had for many years taken a leading part in urging that fresh legislation was necessary on this subject, and whilst the Act did not go so far as they could have wished, it was welcomed as a measure intended to assist in improving the very unfair and unsatisfactory conditions which existed. The Act, however, made no mention of Level Crossings or Bridges *over* roads (with their consequent question of headroom). The Committee, therefore, decided to send out a circular letter to all Members, asking them to send in a list of such level crossings, and of bridges over roads, in their districts, so that a full list might be prepared for use at an opportune date.

The Committee would be grateful if Members would do all they could to render as complete and accurate reports as possible, when they were called for. Questionnaires were sent out on rare occasions, and only when it was essential that the full facts asked for should be known so that their representatives might, on behalf of members, put the most complete evidence before the authorities with whom they might be negotiating. The Committee hoped to press these matters forward during the forthcoming year, but they could not do so without the necessary detailed information.

On the 21st July last, a Member was conveying a heavy load (a transformer) from Walton-on-Thames to the neighbourhood of Banbury, when the engine skidded on Overthorpe Hill, and the load turned completely over, killing the steersman and seriously damaging the transformer and whole plant. The engine and trailers were rubber tyred, and had the latest improvements with regard to brakes, etc., but owing to the very slippery state of the road, the engine skidded down the hill. Other cases of similar accidents had been brought before the Committee, who had felt that it was time something should be done, and they were now in communication with the Minister of Transport in an endeavour to get some action taken as to the making of better roads that would withstand the heat, and damp weather. It was very often a question of efficiently gritting the roads, but in many cases Surveyors did not carry out the recommendations of the Minister of Transport.

Owing to a communication received from the Minister of Transport, the Committee had carefully considered the question of fitting spark arrestors to all engines; at the present time there was no specific Act of Parliament which stated that a spark arrestor must be used. If an engine caused a fire whilst it was travelling on the highway, it was no excuse for the Owner to say that his engine was fitted with a spark arrestor, and the Owner was liable for the damage caused by the fire. The Committee issued a circular letter warning Members that it would be wise to have a spark arrestor fitted, either in the smoke box, or on the chimney. Their reason for doing this was that a good many fires had been caused by sparks during the recent dry summer, and they considered that in so far as was possible the Owners of Locomotives were in duty bound to prevent such fires and inconvenience to the public.

The prices for Threshing, etc., prevailing in the different Districts for the 1929/30 Season, did not vary much from those of last Season.

In Parliament.

Traffic Signals. Major Glyn asked the Secretary of State for the Home Department what steps were now being taken, or were about to be taken, in the Metropolitan Police area to introduce automatic traffic signals; when legislation would be introduced in order that proceedings might be taken against persons who did not obey such signals, and thus make it possible to effect a reduction in the number of Metropolitan police on point duty; how many police constables were to-day so employed; and what was the total cost of these officers in pay and allowances? **The Under-Secretary of State for the Home Department** (Mr. Short), replying, said that the Minister of Transport, after consultation with the London Traffic Advisory Committee, had in hand arrangements for an experimental installation of traffic signals in a portion of Oxford Street, and a provision as to disobedience to the indications of traffic signals was included in Clause 45 of the Road Traffic Bill now under consideration in another place. The number of constables employed on traffic duty in the Metropolitan police district in a recent week was 1,423, including about 1,100 authorised for permanent point duty. The average annual cost per constable was about £320 without making any allowance for relief for sickness, etc.

Dazzling Headlights. Mr. Ormsby Gore asked the Minister of Transport whether he would request the Department of Scientific and Industrial Research to furnish him with a further report on the most modern devices and controls tried or adopted in different countries for dealing with the problem of dazzling headlights on road vehicles in time for publication before the House of Commons was asked to deal with the Road Traffic Bill? **The Minister of Transport**, in reply, said that so far as he was aware, the elimination of dazzle had not been the subject of investigation by the Department of Scientific and Industrial Research. The problem involved practical as well as scientific considerations and the technical officers of his Department were in constant touch with all modern developments. The Road Traffic Bill did not deal with the lighting of road vehicles, which was covered by the Road Transport Lighting Act, 1927, and he was considering the advisability of making a regulation under that Act.

Parking Places in London. Mr. Hall-Caine asked the Minister of Transport if he would consider extending the time at present allowed on parking places in the West End of London? **Mr. Herbert Morrison** said he saw no reason for extending the time at present allowed on parking places in any part of London. **Mr. Hall-Caine:** Is the hon. Gentleman aware that there is garage accommodation for only about a quarter of the vehicles that use the West End of London and that want to park, and that even when they do go into garages, the price is exorbitant for the poorer man? **Mr. Morrison:** With regard to the first part of the question, I am not satisfied, on the information before us that that is the case. In any case, we have to have some cognisance of the danger of our spending large sums of public money on street widenings and then having them, in turn, turned into free garage accommodation.

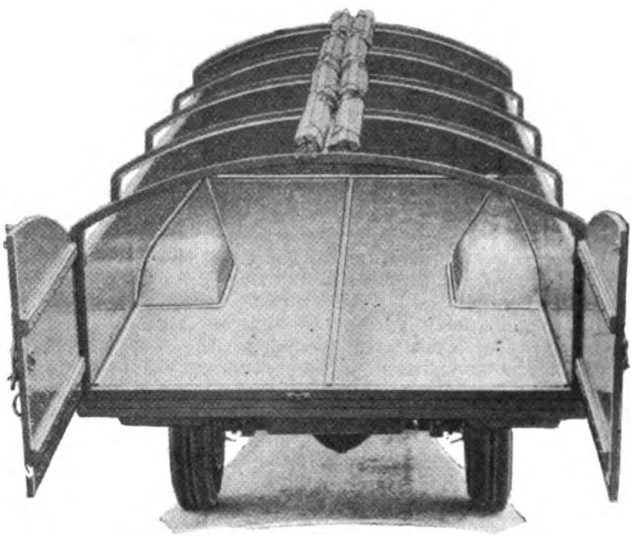
The Vulcan 30-cwt. "Stoke" Low Loader.

THE outstanding feature of the new Vulcan "Stoke" 30-cwt. tipping wagon, is its exceptionally low loading height, this being 26¾ in. only, with wheels shod with pneumatic tyres or 27½ in. in the case of solid tyres. The vehicle is built to the design of Mr. Totty, the assistant Cleansing Superintendent of Stoke-on-Trent, in collaboration with the Vulcan Motor and Engineering Co. (1906), Ltd., Crossens, Southport. It should also be noted that the low loading height is not obtained by fitting wheels of small diameter, the wheels are, in fact, of normal diameter. If solid tyres are fitted, the sizes are 720 m.m. by 90 m.m., single front, twin rear, on disc wheels, and in the case of pneumatics, Goodrich s.s. tyres, 32 in. by 6 in., single front, twin rear, are fitted, also on disc wheels.

Power is transmitted through a fabric-lined clutch to a four speed gear box, the top gear giving a speed of 15 m.p.h. at 1,000 r.p.m. engine speed.

From the gear box, power is transmitted through a tubular propeller shaft with flexible joints, to the overhead worm driven rear axle. Both brakes operate on large diameter drums on the rear wheels, and are of the internal expanding

THE VULCAN "STOKE" 30-CWT. LOW-LOADER.



SHOWING THE WHEEL ARCHES OVER NORMAL SIZED WHEELS MENTIONED IN TEXT.

The advantage of having normal sized wheels is that they allow the speed of an ordinary truck, and thus considerable time is saved in travelling to and from the dump.

The chassis is designed to carry a net load of 30 cwt. when fitted with a general purpose body of approximately 12 cwt. and the total unladen weight is then under 2 tons. The engine is a four cylinder monobloc casting, 85 m.m. bore, 130 m.m. stroke, R.A.C. rating 17.9 h.p. The head is detachable, and lugs are provided for lifting purpose. The cylinder block is secured to the aluminium crankcase by the main bearing bolts, which extend through the case. The camshaft and magneto are driven by a silent chain arranged as a triangular drive from the crankshaft pinion. Provision is made for adjustment externally under running conditions, for wear and stretch, by a jockey pulley running on large diameter ball bearings. A gear type pump submerged in the sump supplies oil under pressure to the main bearing big ends, cam shaft bearings and chain drive.

type. The road wheels are mounted on roller bearing hubs. Steering is by worm and wheel.

The dimensions are as follows:—wheelbase, 9 ft. 8 in., track—front 5 ft., rear 4 ft. 8 in., dash to centre of rear axle, 11 ft. 5 in., overall width, including wings, 5 ft. 8 in., dash to end of frame, 15 ft. 1 in., length overall, 16 ft. 3 in., turning circle, 36 ft. The equipment includes two electric head lamps, two electric side lamps, electric tail lamp, speedometer and electric horn.

This chassis is particularly suitable for refuse collection, and for this purpose it may be fitted with a steel lined end tipping body, incorporating the Edwards hydraulic tipping gear. The normal sized wheels necessitate wheel arches, which are tapered towards the front end, to avoid material lodging behind them when the body is tipped. The body holds 7 cubic yards. It is provided with angle iron hoops which carry roll-up canvas covers. The general arrangement may be gathered from the accompanying illustrations.

Pedestrians and the Road Traffic Bill.

A DEPUTATION from the Pedestrians' Association was received by the Minister of Transport, on 10th December, on the subject of the Road Traffic Bill, with special reference to accidents involving pedestrians.

The deputation expressed their strong objection to the proposal to abolish the speed limit for light cars and to the proposed limits in the case of other classes, which they considered too high. They did not consider that the provisions as to dangerous driving were a sufficient safeguard.

They also pressed for the construction and maintenance of suitable footpaths at the sides of all roads, and urged that grants from the Road Fund should only be made where the highway authority were prepared to make such provision for the safety and comfort of pedestrians.

Other points raised were the desirability of dealing with the problem of dazzling head-lamps and of ensuring the use of adequate and efficient brakes.

The deputation referred to the desirability of co-ordination between the various users of the road, and suggested the formation of a council of representatives of the various organisations interested to keep road problems under friendly review.

The Minister welcomed the formation of the Association and thanked the Deputation for placing their views before him in so fair and reasonable a spirit. He promised that they should receive careful consideration. He explained that the whole question of speed limits and dangerous driving was full of difficulty. They could rest assured, however, that his objects were identical with theirs, they only differed in their opinion as to which was the best method of attaining that end, namely, greater safety for all users of the road. With regard to headlights, he referred to the provisions of the Road Transport Lighting Act, 1927. As to footpaths, he claimed that the Ministry, under its general powers, were already doing all that the Deputation had asked; he admitted that in some cases the footpaths were not in as good a state as might be desired, but if any instances were reported to him he was always prepared to press the highway authority to take any necessary action. In conclusion, he said that in the event of the Association becoming really representative, he would give consideration to the question of consulting them in matters affecting pedestrians.

Transporting Priceless Works of Art.

QUITE recently art lovers were startled by the announcement that a Van Dyck masterpiece had been stolen during transit from Brussels to London. When the case arrived in London and was opened it was found that the picture had been cut cleanly from its frame. This news followed closely the good tidings that 800 masterpieces of Italian Painting had been safely delivered at Burlington House, where they now comprise the greatest art show ever seen.

Knowing that Van Oppen & Co., Ltd., the well-known international and overseas shipping and forwarding agents, whose chief office is at 90-91 Bartholomew Close, London, E.C.1, specialise in the transport of art treasures and were entrusted with the collection and delivery to the Royal Academy in London of many of these masterpieces, we called on Mr. W. H. Brothers, the firm's international removals manager. "Of course," we said, "you were not in charge of the transport arrangements in connection with this missing picture." Mr. Brothers smiled: "Of course we were not," he replied, "and if the picture had been dealt with in the same way as we pack and carry all pictures entrusted to our care it would have been delivered safely in London. We have had lift vans specially constructed for this class of work and the pictures are securely packed in zinc-lined cases by expert packers. The cases are placed in the vans which are then locked and sealed. The pictures are kept under our constant observation from the time they are handed over to us by the owners until they are safely back in their custody."

THE EXHIBITION OF ITALIAN ART.

In October last, Major A. A. Longden, D.S.O., the Secretary-General, informed Van Oppen & Co., Ltd., that in view of the satisfactory services rendered by them in connection with previous international art exhibitions the Committee had decided to appoint them the official agents for the collection and delivery to the Royal Academy in London of Italian paintings for the great Exhibition now in progress, and at the close of the Exhibition to return the pictures to their owners.

The firm were responsible for collecting the pictures from all European countries, with the exception of those in Italy, for the transport of which the Italian Government made themselves personally responsible. All the pictures were collected by the firm, packed and delivered safely to the Royal Academy. As far as possible the pictures were assembled at various points, and there placed, after packing in cases as above, in the specially constructed lift vans, but where this was not possible specially protected cases were made. The collection and transit of the pictures necessitated Van Oppen & Co., Ltd., having to enter into negotiations, simultaneously, with H.M. Customs, The Port of London Authority, steamship companies and railway companies, and, as can be readily understood, before these treasures were handed over to Van Oppen & Co., Ltd., the firm had to give absolute assurances to the owners of the pictures as to the routes to be taken and methods to be employed to ensure safe carriage. The time available to the firm for delivering some of the pictures to the Academy was very short. Some pictures were collected from the Louvre on a Thursday night, loaded into a van and delivered to the Academy in London on the Saturday morning. Customs regulations of the various countries had to be carefully observed, and the last consignment of pictures was delivered to the Academy only one hour before the time of opening for the press view.

As in the case of previous exhibitions, the Port of London Authority waived port rates and agreed to charge a specially low rate for dock dues. H.M. Customs arranged for an officer to be in attendance as and when required so that the vans could be conveyed under seal and the seals broken only upon arrival at the Royal Academy and in the presence of the exhibition authorities. The steamship companies and dock companies showed their public spirit by agreeing to convey these works of art at nominal rates, and without such co-operation it would be difficult, if not impossible, to hold such exhibitions and the public would be deprived of the opportunity of seeing such a wonderful collection.

Van Oppen & Co., Ltd., inform us that they offered to loan to the Italian Government their well-known lift vans, constructed specially for the transport of pictures, in which to pack the pictures coming from Italy, but in view of the dimensions of some of the pictures, statuary, etc., the Italian Government preferred to have vans specially constructed on the spot.

The firm made special arrangements to send a courier to Madrid to collect and convey a picture 20 ft. long and 9 ft. high belonging to H.M. The King of Spain, but the Committee, after carefully considering the matter, had to reluctantly relinquish the idea of bringing this enormous picture to London.

THE ENGLISH ART EXHIBITION IN BRUSSELS.

Van Oppen & Co., Ltd., were entrusted also with the work of collecting in this country, transporting to Brussels and returning to this country, the pictures for the historical exhibition of English art which opened in the Musee Moderne in October last and closed in December.

All the pictures were taken out and back without mishap or accident of any kind, and this in spite of the very bad weather which prevailed towards the end of December when the pictures were returned to this country. The firm might have hesitated to bring such valuable pictures home during the recent gales, but a promise had been given that the pictures would be returned to their owners by Christmas and distribution had to be made from the Royal Academy, London, at a time when the Italian pictures were already commencing to arrive.

Here again the firm's specially constructed lift vans were used. The pictures were collected from all over this country, assembled at the Royal Academy, packed and despatched to Brussels. After the Exhibition they were re-packed at the Musee Moderne. The Exhibition closed on a Sunday and the first consignment home had to be got ready on the Monday and despatched on the Tuesday, and upon arrival at the Academy they were checked and re-distributed to their owners.

Before leaving Brussels the lift vans were sealed in the presence of a Belgian Customs Officer, whilst a British Customs Officer attended at the Royal Academy to break the seals. Every courtesy was shown to the firm by the British Customs Authorities, and once more the Port of London Authority generously agreed to forego port rates in order to assist this important exhibition of British art.

The arrangements in Brussels were made and carried out by Van Oppen & Co., Ltd., in conjunction with their correspondents La Continentale Menkes, Brussels, whose expert packers assisted the staff sent from England.

Mr. Brothers personally conducted each van, both out and home, and superintended the stowage in the ship by special arrangement with the steamship company. In spite of all difficulties Van Oppen & Co., Ltd., adhered rigidly to the programme laid down by them.

New Road Milk Expresses.—A new type of express milk-tank lorry, for the fast conveyance of milk in bulk by road over long distances, is being tried experimentally by United Dairies. The new tankers, which are glass-lined, have six-wheels fitted with pneumatic tyres. Their capacity is 2,000 gallons, which is 500 gallons greater than that of the four-wheelers with solid tyres, introduced a few years ago into this country by United Dairies, of which the company now possesses a large fleet. The weight of the vehicles unladen, is 8 tons, 3 cwts. and their engines are of 40/60 h.p. Painted on the circular back plate of each of the new tanks is a reproduction of a large pictorial poster issued by the firm.

British Industries Fair. — In order to assist motorists visiting the British Industries' Fair, Birmingham, which takes place between February 17th and 28th, the R.A.C. has prepared a leaflet containing specially compiled maps indicating the approach roads from the surrounding towns and a recommended route encircling Birmingham, which avoids the heavy traffic in the centre of the city. Details of a route by which the Fair can be reached from Central Birmingham without traversing traffic-congested streets are also given. Copies of this leaflet can be obtained from the Midland Office of the Club, County Chambers, Corporation Street, Birmingham, or from the R.A.C., Pall Mall, London, S.W.1.

50 YEARS WITH STEAM ROLLERS.

To the Editor of THE WORLD'S CARRIERS.

SIR,—An interesting ceremony was performed at Rochester the other day, when gold watches were presented by the chairman of Aveling & Porter, Ltd., to 16 men who had been in the firm's service for 50 years or more. The steam roller has been such a familiar sight to most of us from our youth upwards that it comes as rather a shock to realise that these men have seen it develop almost from its inception, 62 years ago. Theirs has been the interesting experience of watching its evolution right from its first crude and cumbersome form which caused such consternation amongst horses and made the famous "Invicta" so apt a trademark! How little did the horse in those days realise that the engine which scared him so much was really a good friend—saving him many a lame foot, for until the late Mr. Thomas Aveling invented the steam roller, roads were made up by throwing down quantities of loose stones which were levelled out by passing traffic—a cruel proceeding for the animals which had to share in this duty.

The first steam roller was an enormous affair with the funnel between the back rollers, a huge front roller, a platform at axle height on both sides, and the driver stood on one side steering the machine with a large wooden wheel like the helm of a ship. In 1880, the steam roller had changed its form, and resembled a traction engine with rollers instead of wheels, and since the front rollers had to be tucked away under the smokebox, they were, according to modern ideas, ridiculously small. The saddle bracket and large front roller were introduced later, when the "Aveling" roller took on a shape similar to that of the present highly efficient machine.

These 16 men have also seen the introduction and development of the Aveling Diesel Roller, which is equipped with the slow-speed Blackstone engine, and has proved so economical and reliable.

In the course of their lives they have assisted in the construction of thousands of steam rollers, and hundreds of diesel rollers. The products of their labours have gone into many distant lands. Half a century ago the U.S.A. was one of the firm's best customers, and even to-day, Aveling & Porter rollers are working in many American cities. There are still a few American dependencies from which the British rollers have not been shut out by high tariffs, and these are still taking the firm's machines.

Iceland is a country not usually associated with the use of road rollers, but several Aveling and Porter rollers are working there, whilst at the opposite end of the earth, hundreds have been sent out to Australia and New Zealand.

The firm's rollers are a familiar sight miles up country in China, in India, and Africa, as well as in America and Europe. It is almost impossible to name a country, or even island of any size, where Aveling & Porter rollers cannot be found.

In War time, as well as in peace, the firm has played its part. Even in the Russo-Turkish war, Aveling traction engines were used for hauling heavy guns, and again in South Africa, they were employed on similar work. During the European War, many rollers carried, besides "Invicta" (which means "Unconquerable"), the devout wish, in chalk, "Roll on Duration."

The high regard in which Aveling and Porter rollers are held in all parts of the world, is due largely to the conscientious work of these veterans and their fellow workers, and enterprising pickpockets may be interested to learn that there are a number of men in the running for further gold watches, for, besides the 16 men with 50 years service, there are 19 with between 40 and 50 years service, 52 between 30 and 40 years, and 58 between 20 and 30 years—a total of 145 long service men—a fine record.

Yours faithfully,
AGRICULTURAL & GENERAL ENGINEERS, LTD.,
W. H. TEMPLE,
Publicity Department.

Aldwych House,
Aldwych, London, W.C.2.
6th January, 1930.

CANALS AND ROAD CONGESTION.

To the Editor of THE WORLD'S CARRIERS.

SIR,—There seems to be a possibility that the Government, in its anxiety to promote labour-absorbing development schemes, will concentrate on the roads and railways, and overlook the fact that the simultaneous development of our inland waterways is a necessary part of any sound scheme of transport improvement.

I have failed to observe, in the recent references to canal development, any practical suggestions for giving complete or partial effect to the recommendations of the Royal Commission on Canals and Inland Waterways, 1909, and so far as I can see, the Grand Union Canal Company's application for State assistance to increase the capacity of the London to Birmingham route is the only attempt so far made to exploit this great national asset on sound lines.

The present lack of co-ordination of our transport facilities, to which the Minister of Transport referred recently in the House of Commons, is, in my opinion, the chief cause of the chaos which exists on the roads of this country.

Why not then make greater use of our canals and inland waterways? They are ideal for the transport of heavy and bulky merchandise, such as coal, cement, iron, steel, timber, grain, oil and petrol.

Manufacturers and merchants who now send their raw materials and finished products by canal, not only help to relieve traffic congestion elsewhere, but effect considerable savings in transport costs—as much as from 5d. to 3/- a ton, according to evidence recently given before the Royal Commission on Transport.

Yours faithfully,
JOHN R. REMER.

House of Commons.
November 27th, 1929.

New Year Gifts.

WE acknowledge with thanks, New Year souvenirs which we have received in the form of calendars, diaries, memo blocks, pocket books, etc., from a number of readers and advertisers. These include:—

Wensley, Ltd., 68 Severn Grove, Cardiff.

Atlas Express Co., Ltd., 86 to 92 College Street, Aberdeen.

Trojan, Ltd., Purley Way, Croydon.

Walter Gammons, Ltd., 65/6 Basinghall Street, London, E.C.2.

John I. Thornycroft & Co., Ltd., Thornycroft House, Smith Square, Westminster, S.W.1.

The D.P. Battery Co., Ltd., Bakewell, Derbyshire.

Pennsylvania Railroad.

George Baker & Sons, Ltd., Hampton Park Works, Southampton.

P. & O. and British India Steam Navigation Companies, 122 Leadenhall Street, London, E.C.3.

Duff & Sons, 22 and 25 St. George's Road, Wimbledon.

Henry Green & Son (Haulage Contractors), Ltd., Rifle Street, Poplar, E.14.

Chloride Electrical Storage Co., Ltd., Clifton Junction, near Manchester.

Parry, Leon & Hayhoe, Ltd., Exploration Buildings, Commissioner Street, Johannesburg, South Africa.

Sentinel Waggon Works, Ltd., Shrewsbury.

Harvey Frost & Co., Ltd., 148/150 Great Portland Street, W.1.

Associated Equipment Co., Ltd., Windmill Lane, Southall, Middlesex.

Lancashire United Transport & Power Co., Ltd., Atherton, Lancs.

McNamara & Co. (1921), Ltd., 3 Hill Street, E.C.2.

Fodens, Ltd., Sandbach, Cheshire.

Travellers Insurance Association, Ltd., 26 Cannon Street, E.C.4.

Raybestos-Belaco, Ltd., Central House, Kingsway, W.C.2.

Daylight Fogs and Motor Lights. — The Automobile Association suggests that motorists should light their lamps during fogs in day time. Although the lights may not be of much assistance personally, they will indicate the location of vehicles to other road users.

Change of Address. — The London address of A. C. Wells & Co., Ltd., engineers and merchants, of Carnarvon Street, Cheetham, Manchester, is now at 4 Bradley's Buildings, White Lion Street, Islington, London, N.1. The phone number is North 1992.

Publications Received.

THE SHIPPING WORLD AFLOAT AND ASHORE. — Compiled and Edited by John A. Todd, M.A., B.L. (Sir Isaac Pitman & Sons, Ltd., Parker Street, Kingsway, W.C.2. Price 7/6 net.) This is a survey of the world's shipping, founded on lectures delivered at the City School of Commerce, Liverpool, of which School Mr. Todd is the Principal, and the book covers such matters as the ship, the engines, ship operating, trade routes, the shipbroker, passengers and emigrants, shipping office organization, owners' and employees' organizations, navigation, salvage, ports and harbours, coasting and inland transport, warehousing, and cold storage. Mr. Todd in the preface explains the main purpose of the work. He points out that the Liverpool School of Commerce has, since 1924, been experimenting in the provision of special courses for men engaged in the two chief trades of the locality—cotton and shipping, and in connection with these courses summaries of the lectures were prepared for the students. The lectures attracted so much attention that it was thought desirable to bring them all together in book form. The work of compiling and editing the summaries has been done by Mr. Todd, but in every case the text was submitted to the original lecturer, and for this supervision, as well as for permission to use the material, the compiler says he owes a very real debt to the lecturers. The object of the lectures was to give young men in every section of the shipping trade some notion of the work which they have never seen, but all of which, directly or indirectly, affects their own work. The increasing sub-division and specialisation of all branches of commerce, says Mr. Todd, make it impossible for any man to acquire direct experience of more than a very few branches of even his own trade, and it is, therefore, all the more necessary that he should have opportunities outside of his own office experience to learn something of these other branches and their place in the organisation of the trade as a whole.

CANALS AND INLAND WATERWAYS. — By George Cadbury, Managing Director of Cadbury Bros., Ltd., and Chairman of the Severn and Canal Carrying Co., Ltd., etc., and S. P. Dobbs, B.A., formerly Lecturer in Economics in the Universities of Toronto and Sheffield. (Sir Isaac Pitman & Sons, Ltd., Parker Street, Kingsway, W.C.2. Price 7/6 net.) The question of developing the canals in this country has lately been well to the fore, and on behalf of the Federation of British Industries and the National Union for Inland Waterways, Mr. Cadbury gave evidence recently before the Royal Commission on Transport and placed before them proposals for the economic development of our canals. In this book a most interesting description is given of the British canals and of the place filled by inland water transport in the national system Useful comparisons are drawn between canal transport on the Continent and in this country, and the future of British canals is hopefully discussed. In a foreword, Mr. Cadbury points out that the subject of canals is one that has been much misunderstood of recent years and there are comparatively few who appreciate the commercial existence or legitimate sphere of usefulness of the inland waterways, which penetrate to the very heart of the country. By those who study transport in its many forms, says Mr. Cadbury, canals are still found to have valuable functions; friction is reduced to a minimum, while wear and tear of the rolling stock hardly exists. It is, therefore, not surprising to find that waterways still provide the cheapest method of moving goods in bulk, and even in the matter of speed, with modern power-driven boats the time taken is not greatly in excess of rail carriage except by special express goods services. The preface to the book is written by the authors jointly. The following subjects are dealt with:—Canal Construction in Great Britain (1755-1830); Organisation and Finance of Early Canals; Economic and Social Effects of Canals; Railway Competition 1840-1905); Canal Construction and Maintenance; The Operation and Organisation of Canal Traffic; Canal Finance; Some Leading Inland Waterways; Foreign Waterways; Canal History since 1906; Rail and Road Competition, and The Future of British Canals. The book is excellently illustrated and well indexed.

SHIPPING DOCUMENTS (Second Edition).—By A. J. Hodgson, M.A. Camb., LL.B. Liverpool, Barrister-at-Law. (Effingham Wilson, 16, Copthall Avenue, London, E.C.2. Price 5/-.) In this new Edition a note dealing with the judicial interpretations since 1925, re the Carriage of Goods by Sea Act, has been added. A further note on the practice of issuing clean Bills of Lading for damaged cargo against a shipper's indemnity follows the text of the Bills of Lading Act, 1855, in Appendix III. These and other additions and amendments add to the utility of the book, (a) as an outline guide to those engaged in overseas trade, (b) as an index to the material Statutes and decisions of the Courts.

GERMAN TRAVELLING COMPANION. — By R. Lusum, Ph.D., Professor of Languages at the Regent Street Polytechnic, London. (Effingham Wilson, 16, Copthall Avenue, London, E.C.2. Price 2/-). This is a new handybook for the tourist and business man. Dr. Lusum is the author of several works on modern languages, for students of German, French, and Spanish, and his "Travelling Companion" has been arranged on practical lines, resulting from experience of actual needs of the present day. The German alphabet is explained with its phonetic pronunciation, all the most important phases of a journey by train, or a stay in the country, are taken into account, a vocabulary of about seven hundred words and phrases is given, and the appendices include tables of weights and measures, and German, English and American money equivalents. Altogether, this will be found a useful pocket vade mecum for the traveller.

GERMAN COMMERCIAL CORRESPONDENCE.—By R. Lusum, Ph.D., German Lecturer to the Regent Street Polytechnic, London. Effingham Wilson, 16, Copthall Avenue, London. E.C.2. Price 3/-). The rapidly reviving interest in the study of the German Language in commercial circles makes opportune the publication of this new business work by Dr. R. Lusum. As German Lecturer to the Regent Street Polytechnic, London, Dr. Lusum has a high reputation and is already author of numerous books on language subjects. His new "German Commercial Correspondence" contains more than 1,200 business terms and phrases. Exercises are set on many kinds of letters, which will prove invaluable to the young foreign correspondent. Every chapter is introduced by a short German text explaining the nature, and giving the general contents of the various kinds of letters occurring in commercial transactions. A German letter is followed by an English letter of the same kind followed again by the outlines of German and English letters to be made up into proper German letters, thereby giving the student a certain latitude of expression and encouraging him at the same time to think independently and to have confidence in himself. All letters and outlines are followed by a vocabulary.

Institute of Transport.

Water Transport Premium, 1929-30.

CONTRIBUTIONS are invited by the Institute of Transport in competition for the Water Transport Premium donated by the Dock and Harbour Authorities Association.

The premium, in the form of a gold medal, will be awarded for the contribution adjudged first in order of merit by the referees, on the following subject, viz.:—

> "Causes of and precautions against, congestion at ports, with special reference to the best methods of preventing congestion of traffic at ports."

The right is reserved to withhold the award if, in the opinion of the referees, acting on behalf of the Institute and the Association, none of the contributions submitted attains a sufficient standard of excellence.

A competitor must be a member of the Institute and/or of the staff of an Authority affiliated to the Dock and Harbour Authorities Association.

Contributions, which must not exceed 10,000 words, exclusive of tables, must be typewritten and submitted in triplicate, and must be delivered to the Secretary of the Institute of Transport, 15 Savoy Street, London, W.C.2, not later than June 30th, 1930. Each author must write under a *nom-de-plume* and enclose with his contribution his full name and address in a separate sealed envelope which must be endorsed with the *nom-de-plume*.

References to books, pamphlets or articles, etc., must be accompanied by explicit particulars thereof, to facilitate ready reference, and any extracts from other works must be shown by quotation marks, and their sources indicated.

The decision of the referees will be final and binding and will be notified to competitors not later than October 30th, 1930.

Omnibus Developments in the Counties of Gloucester, Monmouth and Hereford.

CONSIDERING the scattered character of the population of the counties of Gloucester and Hereford, and also the eastern portion of Monmouthshire, it is remarkable how the motor omnibus services have been developed during the past seven or eight years, until practically every main road and by-road of any importance has a regular service of omnibuses, if not daily, at least on those days which are important to the would-be traveller of the districts served, that is, the market days of the nearest large town.

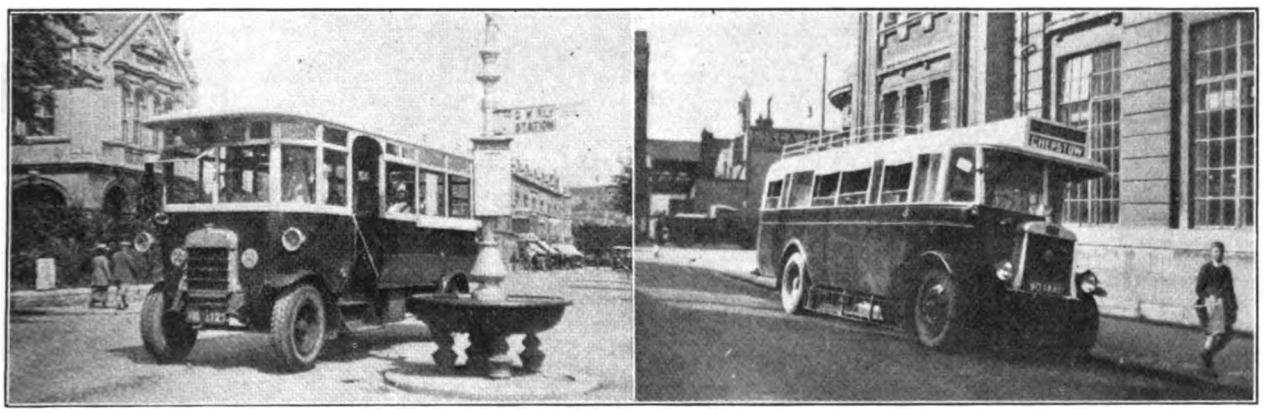
The volume of traffic on market days in these rural parts, constitutes in effect, the "peak load" period, and presents difficulties of its own to be dealt with by the bus operator, as it is often even more concentrated as regards time than the "rush-hour" traffic of the big cities and towns, and owing to the greater distances over which the passengers wish to travel, one vehicle cannot in most cases make two remunerative journeys over a given route.

Thus, it is found that nearly all special market day buses leave the towns shortly after the market is finished, for all destinations, and consequently a number of buses are kept by each concern specially to deal with this traffic. With larger concerns, the extra buses required are concentrated on one town one day, and another town the next day, this enabling the vehicles to be kept in constant employment.

The most important concern serving practically the whole of the area under review is the Red and White Services, Ltd., this concern being a combination of several other bus and coach companies previously operating separately, chief among them being The Hereford Transport, Ltd. "Gloster" (Red and White) Services, the South Monmouthshire Motor Co., Ltd., The Valleys Motor Bus Services, Ltd., and the Valleys (Ebbw Vale), Ltd. Headquarters of this concern is now at Lydney, Gloucestershire, main branch depots and offices being situated at Hereford, Monmouth, Gloucester, Abergavenny, Aberbeeg, Rhymney Bridge and Tredegar, etc., sub-depots being situated at strategic points for convenience of garaging vehicles in the various districts.

Altogether, there are now some 60 different routes which radiate chiefly from Hereford, Monmouth, Chepstow, Gloucester and Newport to Usk, Ross, Hay, Glasbury, Coleford, Lydney and Abergavenny, Pontypool, Abertillery, Tredegar, and the intervening towns and villages.

A number of special services operate from Hereford, Abergavenny and Monmouth on the respective market days at those places.



LEFT: 20-SEATER "BRISTOL" 2-TON TYPE, OPERATED IN FOREST OF DEAN, ETC., BY THE BRISTOL TRAMWAYS AND CARRIAGE CO., LTD. RIGHT: FISHER'S SERVICE—LEYLAND LION 32-SEATER.

What might be termed "trunk" services, are operated from: (1) Hereford to Newport (Mon.), 46 miles; (2) Newport to Gloucester, via Chepstow, 45 miles; (3) Gloucester and Monmouth, via Nailbridge, 30 miles.

Other main routes intersect the above, such as: Abergavenny to Glasbury, and from there to Hereford, Abergavenny to Monmouth, and also to Ross and Hereford; Ebbw Vale and Abertillery, etc., to Usk; and Tredegar to Dowlais, Blackwood and Abertysswg, etc.

Another development of this company's activities is the introduction of a group of daily long-distance express services connecting up the Monmouthshire Valley, and Cardiff and Hereford with Oxford, Reading, London and Birmingham via Gloucester, the latter city being made the centre for changing vehicles for passengers travelling between places not having a through service.

Week-end services (daily during the summer) are also run to Bournemouth, Weston-Super-Mare, Torquay and Plymouth.

The total fleet now operating is over 150 strong, and is comprised mainly of 14-seater Chevrolets, 20-seater Albions ("Viking" model), 32-seater Albions (30/60 h.p. overtype), 20-seater Reos, Thornycroft, and International chassis.

The mixture of the fleet has been occasioned by the absorption of undertakings in the various districts served, these

Digitized by Google

including Walkley's Transport Co., Lydney and Forest of Dean Services, and Blue Star Coaches, Ltd., and also the amalgamations to which reference has already been made.

The City of Hereford, which has a population of some 23,300 is also an important centre for the activities of the "Midland Red" Services, operated by the Birmingham and

CHEPSTOW BUS STAND.
LEFT TO RIGHT: A.E.C. "R.M.S." 26-SEATER; ALBION (20-SEATER), GLOSTER "RED AND WHITE" SERVICE; BRISTOL (20-SEATER), THE BRISTOL TRAMWAYS AND CARRIAGE CO.; THORNYCROFT (20-SEATER), FISHER'S SERVICES.

Midland Motor Omnibus Co., Ltd., this company running four or five services into Hereford daily, and also a local service in the city, and numerous other routes which operate on four or five days of the week, or on Wednesdays only, the Hereford market day. Leominster, Bromyard, Worcester, Ludlow, Eardisley, Hay, Gt. Malvern and Ross are served in addition to numerous villages and hamlets surrounding the towns enumerated, 48 different routes operating in the area.

The "S.O.S." type vehicles built by the company are, of course, exclusively employed, and have proved very popular with the public, and an economic proposition to the company, especially on the "thin" routes, which some years ago would have been ruled absolutely impossible.

Hereford is also served by the buses of the Hereford Motor Co., who run two short distance services from the city. The Blue Bus Service (owned by Mr. R. O. Darling, of Eardisley), runs his vehicles, A.E.C. 26-seaters, daily, and Mr. Yeoman, of Canon Pyon, operates Thornycroft Saloons between Weobley and Hereford.

At Monmouth and Gloucester, the services of the Bristol Tramways and Carriage Co., Ltd. are found, and daily services are run from Gloucester to Bristol, Evesham, Cheltenham, Nailsworth, Cinderford, Ledbury, Painswick, Ross and Hereford, Cirencester, Stroud, Wotton-under-Edge, and Chepstow.

From the last named picturesque historical town, other services radiate to Coleford, Ross, Monmouth and Lydney, and another route is run between Monmouth and Trellech.

All this company's vehicles are, of course, of their own manufacture, and on several routes, the 32-seater "Bristol" superbuses are now in service.

Chepstow, although having only a population of a little over 5,000, is quite a busy bus centre, and during the summer, large numbers of people visit the town and district.

In addition to the concerns already enumerated, the Great Western Railway Co., have taken over the "R.M.S." buses, previously owned by Mr. Rosser, of Usk. The services run from Chepstow to Monmouth, and Newport to Usk, Monmouth, Abergavenny and Pontypool.

Another concern, which employs Leyland "Lion" 31-seaters, and Thornycroft 20-seaters, is G. Fisher's service, of Penhow, a village situated about mid-way between Newport and Chepstow.

Between these two towns, two alternative routes are run—an hourly service on each being maintained daily, whilst an additional service is provided between Newport, Llanwern and Magor.

Another company operating the long distance type of service in this area, is Black and White Motorways, Ltd., of Cheltenham, whose vehicles maintain daily schedules as under:—London and Cardiff, via Gloucester and Chepstow; London and Hereford, via Gloucester; London and Ludlow, via Worcester; Birmingham and Bristol, via Gloucester. The Gloucester Corporation have also recently inaugurated a local motor-omnibus service within the city, with Vulcan saloon vehicles, further extensions being contemplated, including the abandonment of the existing tramways in favour of buses.

LEFT: ALBIONS (32-SEATER IN FOREGROUND) OPERATED BY GLOS., HEREFORD AND MON. (RED AND WHITE) SERVICES AT NEWPORT, MON. RIGHT: THE FAMILIAR "S.O.S." OPERATED BY THE MID LAND "RED" SERVICES, ON THE STAND AT HEREFORD.

Road Vehicles—Great Britain.

A RETURN has been issued by the Ministry of Transport giving particulars of the number of motor vehicles registered for the first time under the Roads Act, 1920, during the month of October, 1929. Copies (price 2/6d.) can be obtained from H.M. Stationary Office, Adastral House, Kingsway, W.C.2.

The return shows the number of each class of vehicle registered for the first time by each Licensing and Registration Authority analysed in detail according to various taxation scales, e.g., motor cars under headings of horse-power, goods vehicles under headings of unladen weight, hackney vehicles under headings of seating capacity, etc.

The number of new motor vehicles registered was 19,925 compared with 18,900 in October, 1928, the figures for the several classes being:—

	October, 1929.	October, 1928.
Cars taxed on horse power	9,853	10,425
Cycles	3,930	3,340
Hackney vehicles	557	595
Goods vehicles	5,105	4,135
Other vehicles	480	405
	19,925	18,900

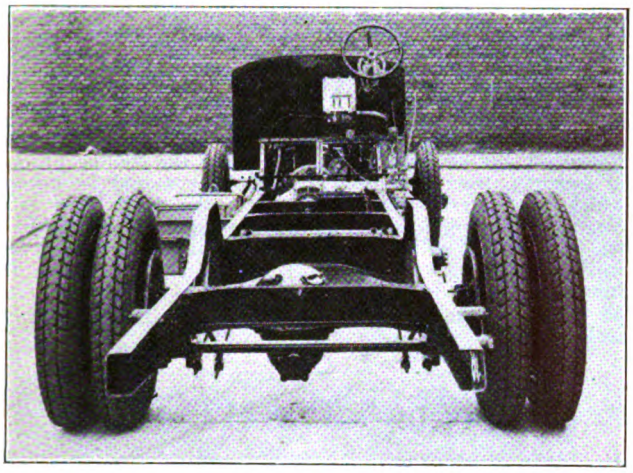
The Crossley "Hawk" Chassis.

THE "Hawk" chassis built by Crossley Motors, Ltd., Gorton, Manchester, is specially built for a 26-seater bus or coach body.

It is fitted with a four cylinder engine of 30/70 h.p. The



REAR VIEW OF THE 30/70 H.P. CROSSLEY "HAWK" CHASSIS.

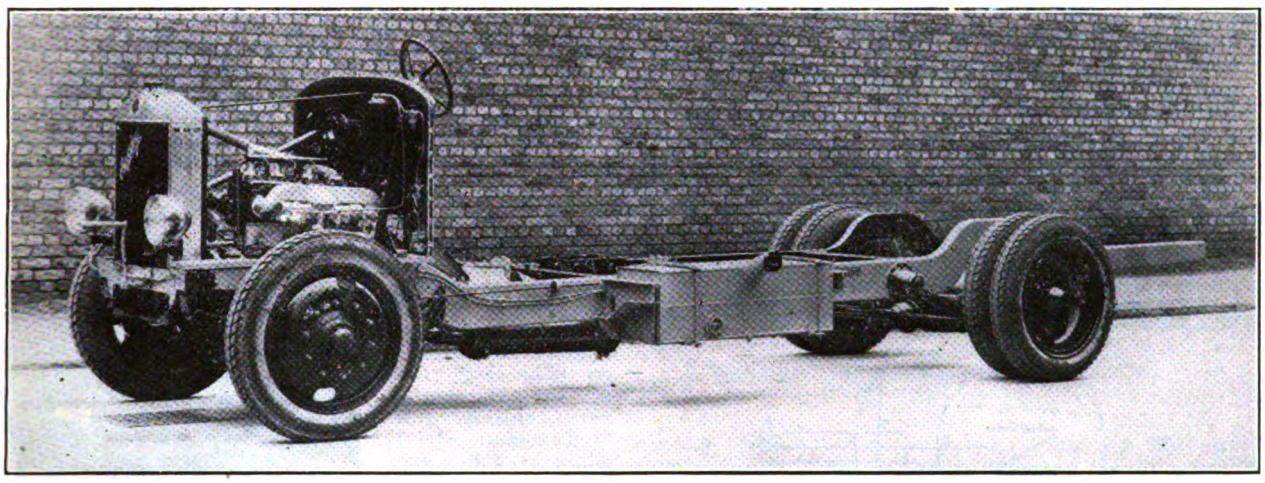
bore is 4 5/16 inches, and the stroke 5½ inches. 48 b.h.p. is developed at 1,000 r.p.m. The crankshaft is carried on five-bearings which are pressure lubricated. The oil pump is placed in the sump and driven from the end of the camshaft. The oiling is on the dry sump principle, the main body of the oil being retained in a separate chamber. The water for cooling is circulated by pump. Ignition is by magneto. The cylinders are cast in pairs, and are provided with detachable heads. Power is transmitted through a single plate clutch and double flexible coupling shaft to the four speed gear box. The gear shafts run on ball bearings. The gear ratios are as follows:—first 5.884 to 1, second, 3.29 to 1, third 1.88 to 1, fourth direct, and reverse 5.18 to 1. The back axle reduction is 5.20 to 1.

Transmission from the gear box to the back axle is by open propeller shaft with three universal joints, the centre joint dividing the shaft into two short lengths. The forward part is supported at the rear by a large self-aligning ball bearing. The rear axle is the full floating type with under driven worm gear. The road wheels are mounted on taper roller bearings. The wheels are shod with 36 in. x 6 in. S.S. pneumatic tyres, single front, twin rears, and the wheels themselves are of the detachable steel disc type with 10-bolt hubs.

Both hand and foot brakes are of the internal expanding type operating in large wheel drums. The four wheel brake is foot operated through the Dewandre Servo attachment. The hand brake acts on the rear wheels only.

The steering gear is the cam and lever type. The petrol tank is on the near side of the chassis, and holds 35½ gallons, and there is Autovac feed to the carburetter.

The dimensions are as follows:—Wheelbase 15 ft. 6 in.; track, front and rear 5 ft. 10½ in.; ground clearance 11 in.; dash to rear axle centre 13 ft. 3⅜ in.; overall chassis length 23 ft. 10⅜ in. The dynamo is driven from the front of the engine and the dynamo and accumulator capacity is suitable for two head lamps; two side lamps; 10 interior ½ amp. lamps; 2 indicator lamps; one Ruby rear lamp, and one dash lamp. The head lamps are supplied with the chassis. An engine starter is supplied at extra cost.



SIDE VIEW OF THE 30/70 H.P. CROSSLEY "HAWK" CHASSIS.

Presentation to Mr. C. Watling.

A HAPPY event took place at the Criterion New Restaurant, Norwich, at the close of the year, when the Sheriff, Mr. C. Watling, managing director of C. Watling, Ltd., the well-known transport contractors, of Westlegate, Norwich, entertained the employees and their wives, numbering 120, to dinner and a social evening, to enable the men to meet his son, Mr. Geoffrey Watling, who is about to join the staff.

Mr. C. Watling, addressing the company, referred to the days just forty years ago when, as a lone figure, he was driving the firm's first parcel cart in Norwich, and then he proceeded to trace the growth of the business to the present day. He said he felt sure the same goodwill would be shown to his son as he had always received himself. He paid tribute to those present, many of whom had over twenty and some over thirty years' service to their credit.

Mr. A. Aylward, of the Norwich office, Mr. C. R. Watling and Mr. J. Howe, of the Yarmouth and Lowestoft branches respectively, extended a warm welcome to Mr. Geoffrey Watling, who, in reply, expressed his pleasure at the opportunity given him of meeting the staff under such happy and pleasant conditions, and said he was looking forward to working with them and having an opportunity of pulling his weight in the business. He realised that these were times of great competition, but he was confident that if they all supported his father and himself loyally the business would continue to prosper. He hoped he would be able to look on them all as his friends even as he wished to be their friend.

The utmost enthusiasm was aroused when, on behalf of the staff, Mr. A. Aylward presented Mr. C. Watling with a handsome silver inkstand inscribed, "Charles F. Watling, Sheriff of Norwich, 1929-30, from the employees of C. Watling, Ltd.," together with an album containing a complete list of the subscribers names. Mrs. C. Watling, the co-director of the company, was presented with a case containing silver toilet requisites as a memento of the occasion.

In acknowledging the presentation, Mr. Watling said he was taken completely by surprise. He thanked them wholeheartedly for yet another proof of their friendship, and declared that this would probably be the happiest event of his year of office. Mrs. Watling also thanked the company for their kind gift.

A vote of thanks to the Sheriff and Mrs. Watling was proposed by Mr. W. Hardiment, seconded by Mr. A. Kybert, and carried with great enthusiasm and musical honours.

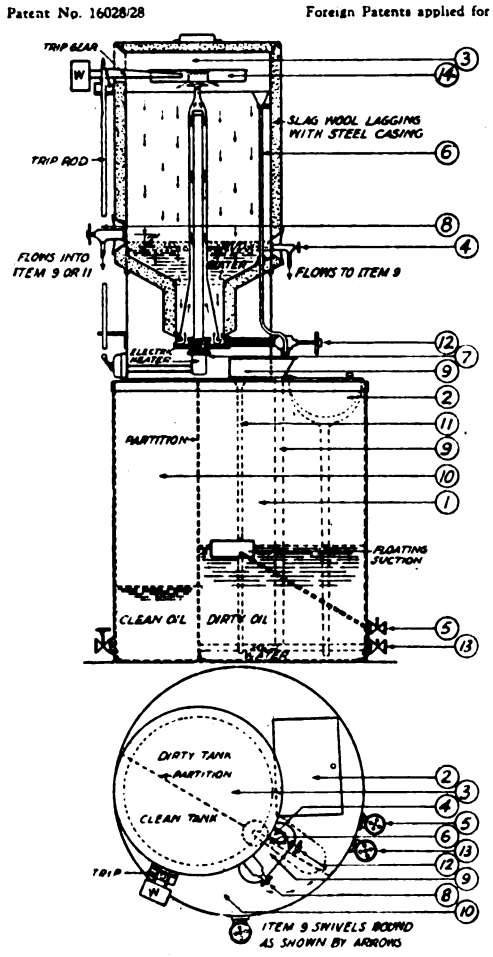
The Fox Electric Oil Cleaner.

THE Fox electric oil cleaner, is an apparatus for cleaning used lubricating oil, so that it may be used again. Oil in crank cases becomes dirty after a comparatively short mileage, but the oil itself has by no means lost its lubricating qualities, and if the oil could be kept permanently clean, the mileage obtained would be almost indefinite. An examination of a dirty crankcase oil will show that it contains from 1% to 2% of abrasive matter, and from 1% to 5% of foreign impurities. This oil, if allowed to remain in the engine, will, in time, injure the engine, whilst if drained, it is simply thrown away as being of no further use. If it can be cleaned, however, the economy resulting will be very appreciable. It is claimed for the Fox electric oil cleaner, supplied by Preston, Stallard & Co., Ltd., Triumph House, 189 Regent Street, London, W.1., that it will clean used oil so thoroughly



THE FOX PATENT ELECTRIC OIL CLEANER.

that it is practically as good as fresh oil. The cleaner is exceedingly simple in operation. Merely pour water and the dirty oil into the cleaning tank, and turn on the electric switch. The machine then operates itself, and when the cleaning process is completed, the current is automatically switched off. A residue of dirt and foreign matter is drained off by a tap, and by turning another tap, the re-refined oil is obtained in a perfectly clean and pure condition. 90% of the oil used is reclaimed in this way, and it is stated that the cost of treatment works out at less than ½d. per gallon with current at the rate of 1d. per unit. The apparatus consists mainly of two tanks, as may be seen in the accompanying illustration. The lower tank is divided by a vertical partition in two parts, which are used for the storage of dirty and clean oil respectively. The dirty oil tank holds 17 gallons, and the clean oil tank 14 gallons. The upper tank, which is thoroughly lagged, is the washing tank, and holds 5 gallons.

The method of operation is as follows:—The dirty oil is poured into the large compartment in the lower tank through a course strainer provided. The strainer is fitted with a pan and pipe leading to the bottom of the tank, where a settlement of some of the heavier impurities such as carbon and water, takes place, the cleaner oil rising to the surface. The water and sediment are drawn off through the drain valve. The partly cleaned oil is then drawn off and poured into the washing tank until it is filled to the required level. The washing tank has already been charged with water up to the required level marked (4) in the accompanying illustration. The electric heater is then switched on and the trip is set. As the temperature rises, the water circulates through the oil in the direction of the arrows, also shown in the illustration, and thoroughly washes it. When the temperature reaches 180 degrees F., the hot water rises up the centre tube and fills the trip tray (14), causing the trip to operate and switch off the electric supply. When the whole mass has cooled off, the process is finished. After the cooling process, in order to test for clear oil, a tap (4) should be opened, which lets water and mud drain into the dirty water tank. Next open tap (8) which is 2 in. above tap (4). The oil from tap (8) drops on to a polished plate, and it can easily be seen whether or not it is clean. If it is sufficiently clean, the funnel (9), which is on a pivot, is swung round, and the clear oil is allowed to flow into it and so down to the clean oil tank.

Glasgow's Travel Centre.

Thomson's Tours and World Travel Bureau.

"KING of the Highways," is the picturesque title that has been bestowed upon Mr. Andrew J. Thomson of Thomson's Tours and World Travel Bureau, Glasgow. Last year, over a million enquiries were dealt with and 50,000 official bookings recorded. The Bureau are agents for all the principal companies operating in England, Wales, Ireland, and Scotland. Last summer, several continental agencies were opened up. An additional agency arranged recently covers tours in Algiers and Morocco. The chief office of the Bureau is very centrally situated in Hope Street, while branch offices are working in Carlton Place and in New City Road. Mr. Thomson has done much to develop road passenger traffic in Scotland. As an instance of his enterprise, he arranged a contract for two coaches to take 60 of the military from Glasgow to Dover, a distance of some 500 miles, a contract that was satisfactorily carried out.

MR. ANDREW J. THOMSON.

The Safety Brake Regulator.—In the December issue of the *World's Carriers*, we gave an illustrated note concerning this Regulator, and for the information of our readers we now give the names of other Factors who are marketing this Regulator on behalf of the Company, S.B.R. Patents, Ltd., Marcol House, 293 Regent Street, S.W.1. The names are Hobday Bros., Ltd., Great Eastern Street, E.C.2., The East London Rubber Co., 29 Great Eastern Street, E.C.2., and G. T. Riches & Co., Ltd., 19 Store Street, W.C.1.

A.E.C. Orders.—Amongst orders recently received for their new range of passenger models, the Associated Equipment Company, Ltd., announce a contract from Thomas Tilling, Ltd., for 100 95 h.p. 6-cylinder "Regent" double-deck bus chassis. Other orders include a further 11 "Regent" double-deck buses for the East Surrey Traction Co., Ltd., and 10 95 h.p. 6-cylinder "Reliance" single-deck vehicles for the Southern Vectis Omnibus Co., Ltd., Isle of Wight.

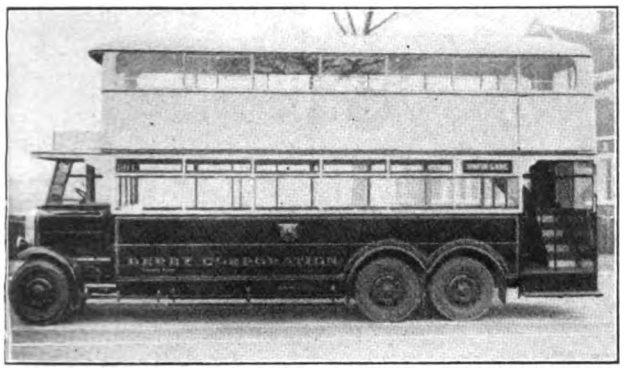
Motor Coach and Bus Notes.

Guy Six Wheelers.—Guy Motors, Ltd., Fallings Park, Wolverhampton, announce that the South Lancashire Transport Company have given them an order for ten trolley bus chassis and the Derby Corporation is putting into service a fleet of Guy six-wheeled petrol buses similar to the one here illustrated. Guy Motors, who are the pioneers of six-wheeled buses, have always claimed that the type gives a higher seat-weight ratio, increased comfort, greater earning power, a reduction in tyre wear, elimination of wheel spin and skidding, considerably reduced wear and tear on the roads and, generally speaking, greater advantages than could be provided by any type of four-wheeled vehicle. No fewer than 16 important Corporations and large numbers of private transport companies have Guy six-wheelers in service.



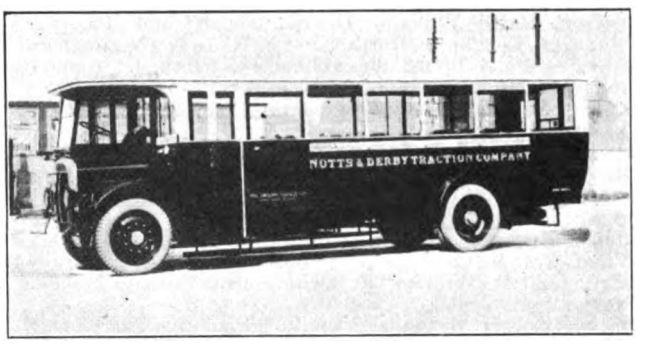
GUY SIX-WHEELED BUS FOR THE DERBY CORPORATION.

Karrier Passenger Vehicles.—We have received from Karrier Motors, Ltd., Karrier Works, Huddersfield, a copy of their latest catalogue "All Passenger Models." It contains complete specifications and illustrations. Copies will be sent to those interested on making application to the firm.

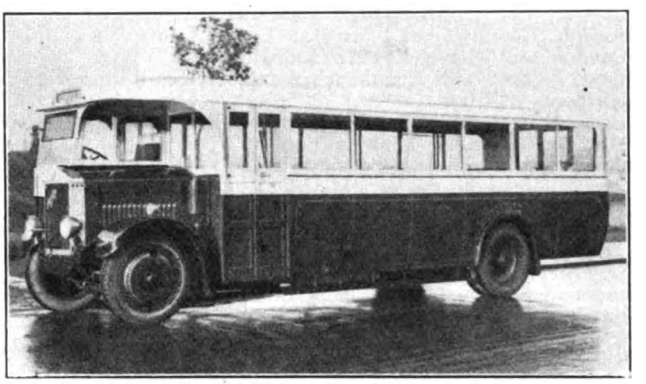
Orders for "Bristol" Passenger Vehicles.—The Bristol Tramways & Carriage Co., Ltd., have recently received a repeat order from the Doncaster Corporation for three "Bristol" Type "B" Light Passenger Chassis and a further repeat order from the County Borough of Rotherham for similar chassis.

Vacuum Servo Braking.—To the brake control of modern motor vehicles so much importance is attached that a recent publication describing and illustrating one of the most popular and efficient braking systems, namely, the Vacuum Servo Braking manufactured by the Westinghouse Brake & Saxby Signal Co., Ltd., 82, York Road, King's Cross, London, N.1, is of particular interest. We recommend this publication to our readers, who may obtain copies by making application to the firm.

"Express" Buses for the Notts. and Derby Traction Company.—Tilling-Stevens Motors, Ltd., 5, Iddesleigh House, Caxton Street, Westminster, London, S.W.1, have recently supplied a number of 30-seater "Express" buses, as shown in the accompanying illustration, to the Notts. and Derby Traction Company. The bodies were constructed by Strachans (Acton), Ltd.



ONE OF THE NOTTS. & DERBY TRACTION CO.'S TILLING-STEVENS "EXPRESS" BUSES.



A CROSSLEY "EAGLE" RECENTLY DELIVERED TO SYKES' MOTOR TOURS.

Crossley "Eagle."—Our photograph shows a 32-seater Crossley "Eagle" bus recently delivered to Mr. John Sykes, the well-known Manchester coach operator of Sykes Motor Tours, Sale, Cheshire.

National Safety First Association.

THREE new pamphlets, compiled by Lt.-Colonel J. A. A. Pickard, under the supervision of the Royal Automobile Club, the Automobile Association and the Commercial Motor Users' Association, will be issued to some three million motorists in Great Britain and Northern Ireland during 1930. They are supplied free of charge to registration authorities for issue by them with motor driving licences.

"On the Road 1930," is an entirely new pamphlet which will be issued to all motorists in Great Britain who renew their licences during 1930. Its principal purpose is to give information upon local bye-laws, regulations or requirements which are not universally known. For approximately one hundred of the principal cities and health resorts, an ingenious gazetteer has been compiled from information supplied by Chief Constables. There is an illustrated description of the new automatic traffic control light signals which are rapidly being installed in all the chief centres. The principal causes of accidents are set out, together with a few "Safety First" maxims.

"Road Sense 1930" (English edition). This pamphlet will only be issued to applicants for a *first* driving licence. Mr. Herbert Morrison, M.P., Minister of Transport, contributes a Foreword, concluding with the following exhortation:—"So whether you drive lorry, bus, tram, private car or motor-cycle, use your good sense as well as your road sense, and be a real Gentleman of the Road." The contents comprise (*inter alia*) sixteen safe driving rules, including illustrated descriptions of the latest officially recommended driver's signals, police signals, road signs, and automatic signals, and a list of those faults which most frequently cause accidents. This is the fifth of the series of annual pamphlets distributed with driving licences by the National Safety First Association, and collects from all the previous ones the essential points which the novice requires to know if he—or she—is to drive with proper safety and consideration.

"Road Sense 1930" (Northern Ireland Edition). A special edition of "Road Sense" has been compiled for distribution with every driving licence issued in Northern Ireland. Sir R. Dawson Bates, Minister of Home Affairs for Northern Ireland, contributes a Foreword, in which he invites the co-operation of every motorist.

The free issue of these pamphlets is confined to registration authorities. The N.S.F.A. cannot supply copies gratis and post free to motorists who want copies in advance of the issue or renewal of their driving licences, but if any motorist requires a copy of either in advance, he can obtain one, price fourpence, post free, on application to the publishers, the National Safety First Association, 119 Victoria Street, London, S.W.1.

Institute of Transport.

THE following gentlemen have been elected to membership of the Institute of Transport:—

MEMBERS.

Cameron, Alexander, Chairman of the Melbourne and Metropolitan Tramways Board.
Fryer, Edward Harpur, Deputy Secretary and Road Manager, Automobile Association.
Harrison, David William, District Goods and Passenger Manager, London & North Eastern Railway (Nottingham).
Hastie, Andrew, Traffic Superintendent, Synthetic Ammonia and Nitrates, Ltd. (Billingham-on-Tees).
Jackson, Clement, General Manager, Plymouth Corporation Transport Department.
Milne, James, C.S.I., General Manager, Great Western Railway.
More, John Rhys, General Manager, South African Railways and Harbours.
Pittard, Reginald George, Traffic Superintendent, Bristol Tramways & Carriage Co., Ltd.
Rudge, Charles William, Resident Agent, Aire and Calder Navigation (Goole).
Tarleton, Robert Alexander, Deputy Locomotive Carriage and Wagon Superintendent, Jodhpur Railway.
Waggett, Harold George, Goods Agent (Nottingham), London Midland and Scottish Railway.
Watson, Robert, Accountant, Edinburgh Corporation Transport Department.
Wilson, John, O.B.E., Chief Electrical Engineer, Buenos Aires Western Railway.
Wyatt, Horace, Secretary, Imperial Motor Transport Council.
Zedoff, John Axel, Stores Superintendent, Buenos Aires Great Southern Railway.

ASSOCIATE MEMBERS.

Atkinson, George Lewis, Mineral Traffic Controller (Hull), London and North Eastern Railway.
Aubert, Pierre Henri Emmanuel, South African Railways and Harbours (Olifantsfontein).
Austen, Robert Ebenezer, Manager, Springs (South Africa) Municipal Omnibus Undertakings.
Ayling, Arthur Edward, Southern Railway.
Banting, Montague Arthur, Metropolitan Railway.
Barkway, Charles James, Metropolitan and Great Central Joint Committee.
Beatley, Frank Edward Mamertus, Deputy Traffic Manager, Sierra Leone Government Railway.
Bennett, Eric Josiah, Metropolitan and London and North Eastern Railways (London).
Blackburn, Harry Arthur, General Manager and Engineer, Keighley Corporation Tramways and Omnibuses.
Blades, Arthur, Deputy Traffic Manager, Aire and Calder Navigation.
Bowyer, James Harold, London Midland and Scottish Railway (Stoke-on-Trent).
Brits, Henry Kleingbiel, South African Railways and Harbours (Dover).
Byford, Cecil, Assistant Traffic Manager, Port of Basrah.
Dagwell, Herbert Frederick, London and North Eastern Railway (London).
Earp, Alexander Kojiro, London Midland and Scottish Railway (Wolverhampton).
Eastop, William George, London and North Eastern Railway (London).
Fraser, Thomas, London and North Eastern Railway (Aberdeen).
Goodings, Geofrey George, London and North Eastern Railway (York).
Green, Frederick William, Great Western Railway (London).
Harrison, Albert Arthur, Assistant to District Goods Manager (Leeds), London and North Eastern Railway.
Hill, David, London and North Eastern Railway (Edinburgh).
Holland, William Carter, Chief of Rates—Commercial and General Sections—Central Argentine Railway (Buenos Aires).
Horton, Charles Raymond Roper, Traffic Manager (Nottingham), Trent Motor Traction Co., Ltd.
Jewitt, William Middleton, Aire and Calder Navigation (Wakefield).
Kirby, Arthur Sydney, London Midland and Scottish Railway (London).
Lavers, Reginald William Dawson, London and North Eastern Railway (York).
Mackenzie, Charles Howard, South African Railways and Harbours (Robinson).
Marson, Leslie Brittain, London and North Eastern Railway (Hull).
McClelland, Edward, London and North Eastern Railway (Newcastle-on-Tyne).
McIntosh, Alistair John, Great Western Railway.
Phillips, William Smith, London and North Eastern Railway (Aberdeen).
Pickering, William, Traffic Superintendent, Chesterfield Corporation Transport Department.
Pike, Percy Frank, Imperial Chemical Industries, Ltd.
Pride, Albert Thomas Leo, Chief Assistant to Stores Superintendent, Buenos Aires Great Southern Railway.
Quinn, Sydney Lawrence, Assistant General Manager, Brisbane City Council Tramways Department.
Richardson, William Ernest, General Manager and Electrical Engineer, Aberdare Urban District Council Electricity and Tramways Department.
Robbins, Roland Ernest, Assistant Transportation Officer, Bengal Nagpur Railway (Calcutta).
Rostin, Albert August, South African Railways and Harbours (East London).
Royston, James, London and North Eastern Railway.
Savage, Harold John Reginald, Southern Railway (Fleet, Hants).
Sewell, John Humphrey, London and North Eastern Railway (London).
Shipp, William George, London and North Eastern Railway (Bury St. Edmunds).
Sibey, Wilfrid Joseph, London and North Eastern Railway (York).
Sillar, Harold Richmond, London and North Eastern Railway (London).
Statham, Herbert Reginald, Assistant London District Passenger Manager, London and North Eastern Railway.
Taft, Lionel Jessop, London Midland and Scottish Railway (Derby).
Thomas, Charles Edward, District Locomotive Superintendent (Tucuman) Central Argentine Railway.
Thompson, William Henry, London Midland and Scottish Railway (Derby).
Venton, Henry Albert, Southern Railway (Paris).
Wheatley, Robert Michael, London and North Eastern Railway (London).
Worsfold, Ernest Patrick, Chief Assistant Automobile Engineer, British Electrical Federation, Ltd.

ASSOCIATES.

Bailey, Russell, Assistant General Manager, Charles Roberts & Co., Ltd. (Wakefield).
Campbell, Charles Douglas, Assistant Lecturer, University of Manchester.
Campbell, Frank, Director and Manager of Railway Department, Evans Thornton & Co. (Buenos Aires).
Irvine, John Edmond, The Yorkshire Patent Steam Wagon Co.
Ponsonby, Gilbert Jocelyn, Assistant in Transport, London School of Economics.
Surman, Frederick Gordon, Shipping Manager, Morris Motors (1926), Ltd., Cowley, Oxford.
Van Der Stempel, Theodore Marius, Assistant Editor, "Electric Railway Journal" (New York).
Wilkinson, Harry Coates, Transport Manager, H. Newsum, Sons & Co., Ltd., Gainsborough.

Highways. New R.A.C. Committee.

IT has been decided to form a new Committee of the Royal Automobile Club to be known as the Highways Committee, and Sir Henry Maybury has agreed to act as Chairman. The Committee has been formed to take over and co-ordinate that part of the work of the R.A.C. which relates to road construction and the paraphernalia employed in connection with traffic regulation. The Committee will deal with such matters as automatic traffic signals, road signs, warning signs, white lines, road cambers, kerbs, road surfaces, bye-passes, level crossings, dangerous corners, one-way streets, high hedges, ferries, toll bridges, parking places, and so forth. It will have power to carry out experiments and demonstrations, and will take opportunities as occasion arises to lay its views before Government Departments, police authorities, county and other councils surveyors, etc. It is anticipated that such a Committee having for its Chairman a man of such unparalleled experience in all road matters as Sir Henry Maybury, will be able to render incalculable service to all types of road users.

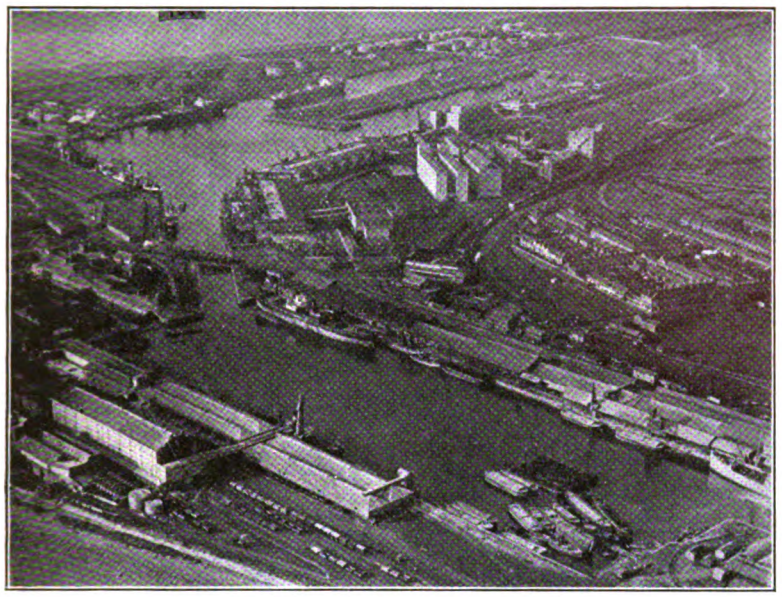
The Port of Bristol.

As one leaves the railway station and crosses the Bristol bridge, the glamour and romance of the great city falls like a veil over the traveller, who sees in the very heart of the city as he passes by, vessels of considerable size loading and unloading on the quayside immediately adjacent to the tramway centre. One's thoughts immediately go back to the great days of exploration and discovery, when Bristol, as the second port of the Kingdom, sent out its sailors and merchantmen to discover new worlds, and to open up new trade routes to hitherto unexplored countries. The Merchant Venturers of Bristol, however, do not merely remain as a thing of the past, full of interest as a vision of what once was, but they are known as a society carrying on good work at the present day, and instilling into the minds of the rising generation the high qualities of courage and enterprise which gave Bristol its high position.



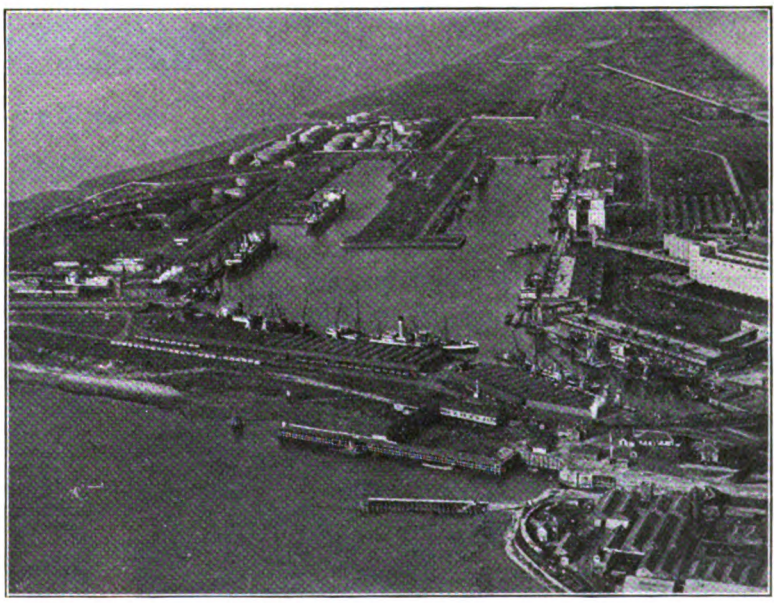
ROYAL EDWARD AND AVONMOUTH DOCKS FROM THE AIR.

The entire dock system of the port comprises the City Docks, in Bristol itself, the Royal Edward and Avonmouth Docks, at Avonmouth, and the Portishead Docks, on the other side of the mouth of the Avon, jutting out into the Severn itself, and the whole of the system is owned by the Corporation of Bristol and controlled by a very efficient Committee of the Corporation under the title of the Port of Bristol Authority.

It is interesting to record that the Port of Bristol has a history extending back over two thousand years, and for centuries it was second in importance only to London itself. It is renowned as the port from which John Cabot and his son Sebastian sailed in May, 1497, in a ship manned by Bristol sailors, who landed the following month on the continent of America and planted the British flag.

To come hurriedly to more modern times, progress during the past 120 years has been steady, and during the past 20 years, has been very rapid. It was between the years 1803 and 1809, that the Floating Harbour, which provided 83 acres of dock space for the City, was formed, coupled with the construction of the New Cut for the channel of the River Avon. 1848, the City of Bristol acquired the Dock Estate, and commenced a number of harbour improvements. In 1877, the Avonmouth Dock was opened, followed by the Portishead Dock in 1879. These docks were built by private enterprise, but were taken over by the Corporation in 1884. In 1908, the Royal Edward Dock was opened, having a lock 875 ft. long, and 100 ft. wide. During the Great War, extensive war services were carried on in the port, and the net register of tonnage of that period showed a tremendous increase. Between the years 1922 and 1928, extensive additions were made to the equipment of the Port, including the construction of the Eastern Arm of the Royal Edward Dock, which was opened by H.R.H. The Prince of Wales, on May 23rd, 1928. During the period since 1803, the net register of tonnage of the port has increased from approximately 300,000 tons to 3,370,000 tons.

While the older docks of the City are those upon which the prosperity of Bristol depended for so many years, it is perhaps better, in a brief review like this, to commence with the newer docks at Avonmouth, these being of the most modern and up-to-date character, equipped with machinery and accommodation for dealing with very large vessels and an enormous amount of traffic.



AERIAL VIEW OF ROYAL EDWARD DOCK.

Commencing with the Royal Edward Dock, there are two sheds, each 500 ft. long and 100 ft. wide, having two floors and a flat roof with railway access on both sides and facilities for loading into motor lorries at the ends o

PORTISHEAD DOCK. TIMBER WHARF ON RIGHT.

95 in No. 2 Granary, used for storage only, the grain being returned to the first granary for delivery. There are four granaries, which are interconnected.

In connection with the discharge of grain, there are five floating elevators which work on either side of a vessel, giving rapid discharge either to craft, barge, or travelling bands for storage in the granaries. There are also 15 barges, owned by the Port of Bristol Authority, to accelerate the discharge of grain from ocean steamers. At this dock there is outdoor accommodation for about 8,000 standards of timber on an area of 10 acres, and covered accommodation for about 6,600 standards.

The new Eastern Extension of the Royal Edward Dock is 1,700 ft. long and 400 ft. wide, and provides three deep-water berths on each side, having a total length of quay of 3,600 ft. and a water area of 21 acres. On the eastern side of this extension, there are two sheds and each shed. The sheds are built of ferro-concrete, and are equipped with six 30-cwt. electric roof cranes for each shed. Grain cargoes are discharged by floating elevators working from the holds of the vessels to hoppers on the quay, and are then delivered on to bands in a tunnel running under the front verandah of both sheds to the granaries at the rear, while general cargo is discharged by the electric cranes, and is delivered to the several floors either by cranes through the hatchways, or in the case of the ground floor, by means of electric trucks.

The cold stores, which were completed in 1920, at a cost of £160,000, are directly connected with the Transit Sheds by means of conveyor galleries and by these means the meat is conveyed to the cold chambers with the minimum exposure to the air. The total cold storage capacity is about 500,000 cubic feet.

The Royal Edward granaries and grain handling equipment are of the most up-to-date character and are on the silo principle, the capacity of the silos ranging from 60 to 400 tons of wheat each. There are 78 silos in No. 1 Granary, which are used for storage and delivery, and

EASTERN ARM, ROYAL EDWARD DOCK, SHOWING TRANSIT GRANARY.

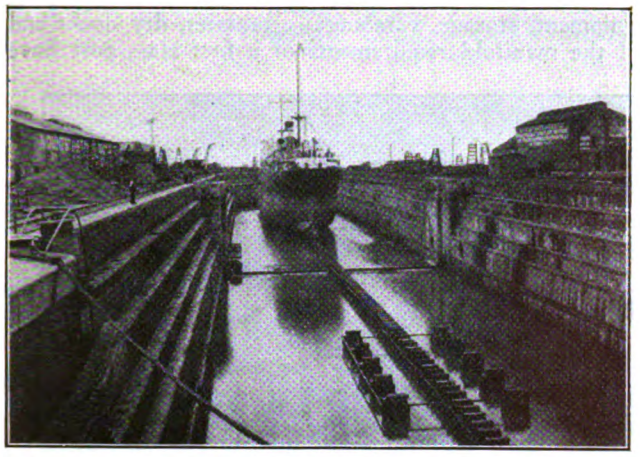
grain galleries of three floors each, these being 500 ft. long and 150 ft. wide.

The western arm is 580 ft. in length, and is designed for the discharge of oil vessels, timber cargoes and general

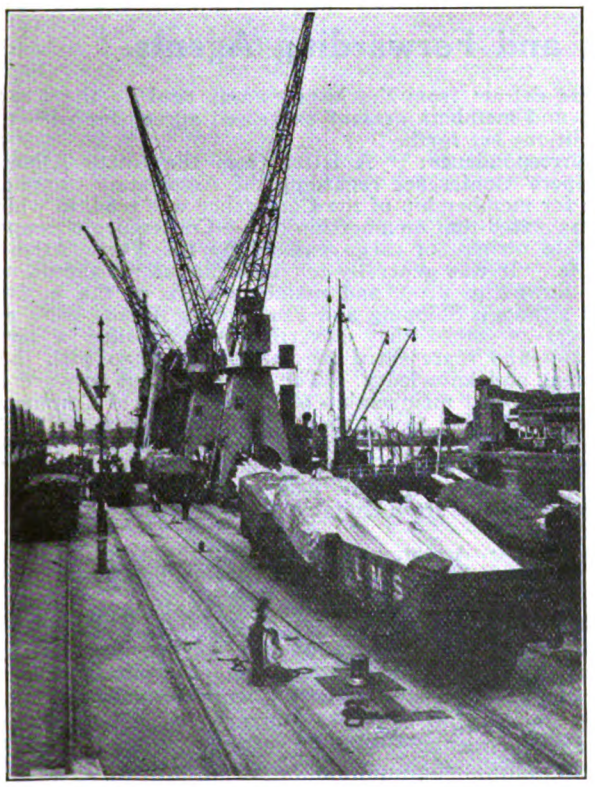


ROYAL EDWARD GRAVING DOCK.

open quay work. All the well-known oil importing companies have their installations in this part of the dock and the jetty, which is 340 ft. long, with the new wharf, accommodates all the oil carrying vessels entering the dock.

The Graving Dock—a very fine dock—is 875 ft. in length, and 850 ft. on the blocks, with a width of 100 ft. It is equipped with a 25-ton electric travelling crane and a steam travelling crane of smaller capacity.

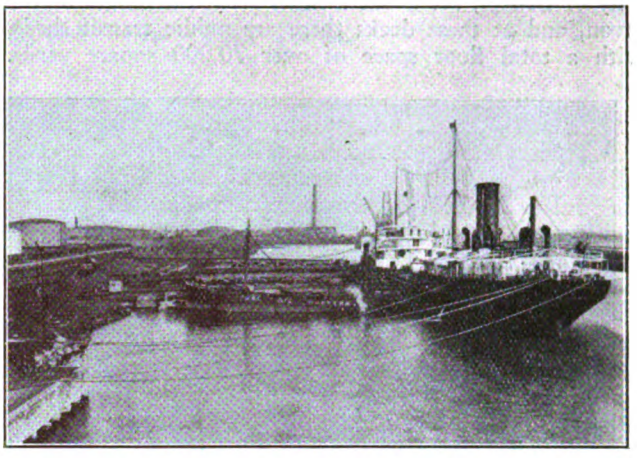
The Royal Edward Passenger Station has extensive accommodation for the comfort and saving of time of



DISCHARGING TIMBER, R. SHED, ROYAL EDWARD DOCK.

passengers and the expeditious handling of mails. This station is chiefly used at present for the passenger services with the West Indies, carried on by Elders and Fyffes' and Bethell, Gwyn's steamship lines from Australia and New Zealand, and the Henderson and Bibby lines straight from Rangoon.

There is a floating crane of a maximum lifting capacity



ROYAL EDWARD DOCK, OIL JETTY.

of 35 tons available for use at either of the docks within the Port.

ROYAL EDWARD DOCK TRANSIT SHED.

The Avonmouth Old Dock has extensive shed accommodation for general cargoes and grain handling and

storage. An important trade of this dock is the banana traffic of Elders and Fyffes, Ltd., with special mechanical handling appliances for the rapid discharge of bananas.

Digitized by Google

There is a service of two vessels weekly from Central America and the West Indies, with occasional shipments from the Canary Islands.

The City Docks, which are situated in the centre of the City of Bristol, are about 7 miles from the mouth of the Avon, and at these docks there are public transit sheds, with a total floor space of over 70,000 square yards. They are equipped with cranes and travelling gantries, granaries and grain sheds, cold stores and cattle lairs.

The Portishead Dock is 12 acres in extent, and is entered by a lock entrance 472 ft. long and 66 ft. wide. Here too is splendid accommodation and equipment for handling grain and timber cargoes and for petrol storage.

Whatever may be said for the principle of municipal ownership of ports and docks as contrasted with ownership by a semi-independent Port Authority or by Railway Companies, there is no doubt that Bristol, by its progressive spirit has not only kept the docks up to modern requirements, but has, by its foresight, provided facilities to meet all the requirements of the present day and its equipment, storage warehouses, granaries, dry docks and all the manifold requirements of a first class port have been provided to the full. A great point is made of the geographical position of Bristol, with its special facilities for direct shipment to the West, and its great hinterland of the Midlands with its many industries.

After a visit to the docks, one comes away not having lost the feeling of romance attaching to Bristol, but having added to it a great belief in the future of the Port under its able administrators and officials.

British Association of Shipping and Forwarding Agents.

A MEETING of the Council of the British Association of Shipping & Forwarding Agents was held on December 10th last, at which the following were present:—Chairman.—Mr. A. W. Heard (Jones, Heard & Co., Ltd., Newport, Mon.), Vice-Chairmen.—Mr. M. E. Duffett (J. D. Hewett & Co., Ltd., London), and Mr. N. N. Bird (Herbert Watson & Co., Ltd., Manchester), Members.—Mr. A. Faulkner (Crowe & Co. (London), Ltd., Manchester), Mr. F. J. Gerson (Rosenberg, Loewe & Co. Succrs., Ltd., London), Mr. W. O'Brien (G. W. Sheldon & Co., Ltd., Liverpool), Mr. G. W. Robertson (Robertson, Buckley & Co., Ltd., Liverpool), Mr. F. H. S. Rouse (American Express Co., Inc., London), Mr. C. E. Sanderson (Sanderson's Express, Ltd., Nottingham), and Miss L. M. Watson (Acting Secretary).

Apologies for absence were received from Mr. H. Heyman (Morison, Pollexfen & Blair, Ltd.), Mr. J. O. Wood (T. F. Wood & Co., Ltd.), Mr. A. MacCulloch (MacCulloch, McLellan & Pollok), Mr. W. H. James (James & Hodder), and Mr. W. H. Elder (W. H. Elder (Shipping), Ltd.).

The minutes of the last meeting, which had been circulated, were approved and signed as correct. Arising out of the Minutes, Mr. M. E. Duffett (Vice-Chairman) submitted an extract from the Minutes of the meeting of the London Shipping and Forwarding Agents' Conference, which included the following resolution:—

> That this Council is prepared to recommend to the members of the Conference in General Meeting that they should agree to the proposed increase of subscription to £4 4s. for the purpose of implementing the arrangements set out in the Sub-Committee's proposal, provided that the British Association of Shipping and Forwarding Agents at the same time undertakes to remit to the London Conference the sum of £2 2s. per annum per head in respect of any London firms who may take up membership with the British Association of Shipping and Forwarding Agents.

At that meeting it had been decided that "through the representatives on the British Association of Shipping and Forwarding Agents' Council, the latter body should be acquainted at its next meeting with the terms of the above resolution and invited to notify its acceptance of the arrangements with the conditions attached thereto."

The extract from the Minutes was read by the Chairman and members present expressed agreement with the conditions set forth.

Correspondence: A letter from the North Atlantic Shippers' Conference regarding the Association's application for membership of the Conference was read, in which it was stated that membership of the Conference was open only to owners of cargo passing by the North Atlantic Route. It was generally felt that the matter should not be allowed to drop, and members were of the opinion that although Shipping and Forwarding Agents were not owners of cargo they nevertheless controlled a large amount and represented the owners of cargo with their consent and knowledge. The view was put forward by a member that membership of the Chamber of Commerce should be a title to membership of the Conference. As there was some doubt about the terms of the original circular announcing the formation of the North Atlantic Shippers' Conference, Mr. Duffett agreed to refer to this circular and draft a suitable reply to the letter under discussion.

Accounts: A statement regarding the financial position of the Association was made by the Treasurer, which showed a satisfactory state of affairs.

International Federation of Forwarding Organisations: It was reported that a communication had been received from the International Federation concerning a draft of a code of General Transport Conditions most of which were valid in all countries and may, therefore, be considered as recognised trade customs. The Federation urged that the adoption and use of the conditions referred to would be the first step towards the establishment of uniform conditions throughout the Continent.

The Council have these conditions under consideration and will make their recommendations in due course.

Annual General Meeting: The Annual General Meeting of the Association was fixed to take place on Friday 17th January next at Leeds.

International Federation of Forwarding Organisations.

Proposed Usages and Conditions in the Forwarding Trade.

AT the meeting of the International Federation of Forwarding Organisations held in Berlin, on May 9th last, Doctor Weiss raised the question of the drawing up of a uniform set of trade usages and conditions of carriage for use in those countries where forwarding agents' organisations are affiliated to the International Federation. He said that judging from the trade customs and conditions of carriage existing in Czecho Slovakia, Germany, France, Netherlands, Scandinavian States, Denmark, Latvia, Switzerland, Hungary and Austria, many of the customs and conditions were more or less the same, but as they related to various branches of the forwarding trade they could not be adopted as a universal code. He proposed supplementing those usages and conditions, which were in effect identical, by adopting the Universal German Transport Conditions which had been very carefully compiled and were the result of agreement between the merchants and the forwarding agents and covered all the activities of the forwarding agent, and by so doing, they would provide the basis for the welding together of the main uses and conditions into a coherent whole, and build up a universal code of usages and conditions for the whole of Europe. His proposal could receive the consideration of associations affiliated to the Federation in all countries where, of course, trade customs and usages already existed, in order that they could communicate to the Federation the usages and conditions they wished to adopt for each particular country.

A draft set of general transport conditions which we print below have now been drawn up by the International Federation and circulated to affiliated bodies for consideration as to whether such conditions would be valid in the various countries represented within the Federation, and, further, whether such conditions could be introduced. The Federation points out that the draft does not deal with customs, but with conditions which have been laid down by forwarding agents themselves, with a view, after a period of use, to such conditions developing into recognised trade customs. It is pointed out that the adoption and use of the proposed conditions would be the first step towards the establishment of uniform conditions throughout the Continent.

Proposed General International Forwarding Conditions.

1. The forwarding agent is responsible for carrying out his instructions with ordinary commercial care and regard for the interests of his client.

2. These conditions cover all the work of the forwarding agent whether transport, freight, warehousing, commission or other business.

3. Goods are accepted for transport or warehousing only upon the basis of these conditions, and are furthermore subject to the rules, regulations, tariffs and conditions of Railways, Steamers or other means of transport utilised.

4. Failing a definite statement to the contrary, any quotation of a forwarding agent is only valid if accepted without delay, and then only for immediate use and subject to the quotation being referred to in the order to despatch.

5. Through-quotations are only valid for normal transport. In the absence of a special arrangement to the contrary, such quotations shall not be understood to include Railway petty charges, postages, stamps, insurance, duty, frontier charges, clearance charges, cranage, hire of tarpaulins, weighing charges, rent, snow and ice supplements or other expenses caused by interruptions in any part of the transport. All such charges are to be paid in addition.

6. An order for despatch must contain marks, numbers, quantity, packing and contents of the goods as well as all details necessary for the proper execution of the order. The consequences of incomplete or incorrect declaration are the risk of the client, and the forwarding agent is not bound to verify or to complete the details given to him. The agent is not bound to weigh the goods failing definite instructions in writing.

7. In the absence of sufficient instructions, the forwarding agent may, whilst protecting the interests of his client, use his own judgment as to route or means of transport.

8. The forwarding agent may group the goods together with goods of other clients failing definite written orders to the contrary.

9. If the forwarding agent accepts a consignment with a bill of freight drawn up by his client, he is entitled to make up a new bill of freight bearing his own and his client's name, failing definite orders to the contrary.

10. In the absence of agreement to that effect time of transit is not guaranteed, nor is a guarantee given to handle consignments in any particular order.

11. The forwarding agent is entitled to accept clauses on the freight documents owing to absence of or insufficiency of packing and to order goods to be warehoused en route if necessitated by interrupted or restricted traffic.

12. Events beyond the control of the forwarding agent which partially or completely prevent him from completing his duty (such as war, mobilisation, boycott, revolution, strike, lock-out, passive resistance, official embargo, interrupted communications, congestion of quays, shortage of trucks, interrupted navigation, riot, piracy, quarantine and an Act of God), whether affecting himself or his sub-contractors, free him from the responsibility for completing his contracts.

13. Should an order be cancelled, the forwarding agent, at his option, may claim payment of the agreed price less outlays not incurred, or, alternatively, a reasonable commission.

14. An order to despatch to a foreign destination shall be understood to include authority to clear through Customs if despatch to the final destination is not possible without such clearance.

15. An order to receive goods on arrival, empowers, but does not compel, the forwarding agent to pay out all freights, charges, duties, etc., resting on such goods.

16. Forwarding agents' accounts are payable on presentation. They shall be considered overdue without further demand if not settled at the expiration of 5 days from due date, unless local conditions stipulate a still earlier period.

17. The client must be responsible for all claims for freight, general average, duty, taxes and other dues made upon the forwarding agent as holder of the goods. The forwarding agent is entitled, failing such cover, to take all the necessary steps to protect himself.

18. Delivery shall be legally completed when the goods are handed on the premises of the addressee to any adult person belonging to the latter's business or household.

19. By acceptance of an insurance policy or covernote, the forwarding agent does not accept the responsibilities of the insurer; he must, however, take all necessary steps to protect any claim of the assured.

20. Failing written agreement to the contrary, the forwarding agent insures only on the conditions customary at his domicile, and not against breakage. In the case of objects having chiefly an artistic or sentimental value, such objects can only be insured against total loss. The duty of the forwarding agent as insurer is covered by his entering the goods on a general policy.

21. In the case of a claim, the client can only demand compensation up to the amount received by the forwarding agent from the insurer. The forwarding agent may fulfil his obligation by transferring his right of claim against the insurer to the assured. He is only bound to take up the claim on behalf of his client after written agreement with the client, and then only at the expense and risk of the latter.

22. For negotiating insurance, claiming of compensation and other duties undertaken in case of claim, the forwarding agent is entitled to additional remuneration.

23. The forwarding agent has a lien on all goods in his possession for all monies owing by the owner of the said goods, but this lien does not operate as regards the claims of one forwarding agent upon another.

24. In all his activities, the forwarding agent is only responsible for damages caused through his own negligence.

25. The forwarding agent is only responsible for money, documents, objects of art and valuable goods if the value and condition of such goods has been declared to him sufficiently early to enable him to refuse the order or, alternatively, to take the necessary precautions.

26. If any responsibility rests on the forwarding agent, he shall not be liable for more than:

(a) Sw. Frs. 2.—per kilo. gross weight, maximum Sw. Fr. 2,000 for any one claim.

(b) The declared value of the goods should such be less than under (a) above.

27. If goods are carried in groupage service, or at a through rate domicile to domicile, it is to be understood that the forwarding agent is only responsible as such, and not as a carrier.

28. Damages, even if not outwardly visible, must be notified in writing to the forwarding agent without delay, at latest within 4 days after delivery. Otherwise damage will be assumed to have taken place after delivery.

Digitized by Google

29. Warehousing may take place at the option of the warehouseman in his own or in hired premises.

30. The warehouseman is only obliged to assure the safety of his premises inasmuch as such premises are his own property, and local conditions require that they should be secured and/or watched. If he exercises reasonable care in the selection of his watchers he has fulfilled his obligations.

31. Failing specific agreement, the forwarding agent is not liable for any treatment or preservation of goods whilst in store.

32. Disposal of warehouse goods must be made in writing, and all the necessary particulars must be given.

33. If the forwarding agent undertakes the storage of goods, such goods shall be considered as a pledge for all monies claimed as a result of the warehousing contract, particularly for monies advanced on the goods and for rent.

34. The forwarding agent and/or warehouseman is not responsible for alteration in quality, decomposition, loss of weight or alteration due to heat, cold, water or other elements or for damage by rats, mice or moth.

The next General Meeting of the International Federation of Forwarding Organisations, will be held in Brussels towards the end of May. The actual date and full particulars of the meeting will be announced in due course.

London Shipping and Forwarding Agents' Conference.

A MEETING of the Council of the London Shipping and Forwarding Agents' Conference was held in the London Chamber of Commerce on Wednesday, December 11th last, when the following were present:—President.—Mr. M. E. Duffett (J. D. Hewett & Co., Ltd.); Members.—Mr. J. B. Taylor (Immediate Transportation Co., Ltd.), Mr. W. Woollett (Woollett, Airey & Co., Ltd.), Mr. W. Narracott (Van Oppen & Co., Ltd.), Mr. F. J. Gerson (Rosenberg, Loewe & Co. Succrs., Ltd.), Mr. F. H. S. Rouse (American Express Co., Inc.), Mr. E. W. Turvey (Nunzi & Co., Ltd.), Mr. E. A. Aves (Hon. Treasurer), Mr. H. Gilbert (G. W. Sheldon & Co., Ltd.), Mr. J. B. Ballantyne (J. B. Ballantyne & Co.), Mr. C. McEwan (Thos. Cook & Son, Ltd.), Mr. H. A. Crowe (Crowe & Co. (Ldn.), Ltd.), Mr. G. Perry (British Commercial Transport Co., Ltd.), and Miss L. M. Watson (Acting Secretary).

An apology for absence was received from Mr. H. K. Coppendale, of Messrs. Morison, Pollexfen & Blair, Ltd.

Correspondence.—(a) A communication was reported from the American Section of the Conference concerning Minimum Freights U.K. to New York. The American Section has had under consideration for some time the question of Minimum Freight Rates U.K. to New York. It is recognised that the present minimum freight rates (which are much higher than the minimum freight rates in force on the route New York to U.K.), restrict the export of samples and are harmful to British Trade. The American Section are doing everything in their power to bring about an alteration of this state of affairs and they have the support of the Council in their efforts.

(b) A letter was reported from a member-firm in which they asked if the Shipping Companies could be approached with a view to their issuing less cumbersome Bills of Lading. It was generally agreed that simplification and standardization of the Bills would be very desirable and the President agreed to see what could be done in the matter.

(c) A letter was reported from a member-firm in which they complained that in the German trade vessels were discharged no matter what the climatic conditions were. They found that goods were exposed to rain whilst still in the holds and that further damage was caused during the landing or the delivery overside operations. This complaint has already been taken up by the Council and it is still having their attention.

(d) The meeting had under consideration a circular issued by a Company of Steamship Agents which seemed to indicate that they were starting a Forwarding Agents' business. Several members reported that they had received similar circulars, which had been sent to their agents abroad. It was decided that efforts should be made to find out whether it was the intention of the Company in question to start business as Forwarding Agents in opposition to the members of the Conference.

(e) It was reported that a member-firm had complained that a certain Shipping Company, who had discharged at a berth where overside delivery was not possible, had not sufficiently reduced the landing charge in consideration of this. It was recalled that a similar complaint had been dealt with once before. The President agreed to take the matter up again with the Shipping Company concerned.

Reports from Sections.—(a) **Air Section:** The Chairman of the Air Section reported that the Section Committee had met on several occasions to discuss matters arising out of their interview with Imperial Airways on August 16th last. Some information concerning the data asked for by Imperial Airways had been received from members, but it was very limited because of the small number of agents directly interested and had not assisted the purpose of the enquiry. However, it had been unanimously agreed to seek and accept the concession of Imperial Airways, who are prepared to grant an A/A Rate on consignments exceeding 20 kilos and also establish with Imperial Airways the right of importers or their appointed agents to pass Customs Entry at Croydon, leaving actual clearance and delivery with Imperial Airways, Ltd. It was also reported that negotiations were taking place with Imperial Airways, Ltd., concerning matters of minor interest.

(b) **American Section:** The Chairman of the American Section reported correspondence concerning Through Bills of Lading and Minimum Freight Rates which was taking place between the Section and the New York Freight Forwarders & Brokers Association and the provincial Associations. He also reported that the Liverpool Association had taken up the question of Minimum Freights with certain Steamship Companies and he read letters which the Liverpool Association had received from the Steamship Companies concerned.

Insurance: The minutes of the last meeting of the Insurance Committee were read, from which it appeared that the scheme of insurance which the Committee had had under consideration was not considered suitable. The President asked if the Council were willing that this scheme should be dropped and the members present agreed to this. It was reported that the Committee recommended that a scheme on the lines of the one in force among German Forwarding Agents should be drawn up. It was therefore decided that a summary of the German scheme should be circulated to the members of the Council for their consideration and that members should be asked to send their comments thereon to the Secretary. It was felt that in this way a scheme might eventually be agreed upon which could be recommended for adoption by all the members of the Conference.

Over-Entry Certificates: It was recalled that at a previous meeting a letter had been read from a member-firm in which they stated that they were unable to obtain an Over-Entry Certificate for duty overpaid when goods were landed at their own wharves. In accordance with the decision at that meeting, other members of the Conference who own wharves had been asked to state their experience in this respect. A few replies were reported, and it was decided that the matter should be taken up with the Customs Authorities as had been suggested at the meeting when the matter was last discussed.

Great Western Ports.

THE Handbook of the Great Western Ports for the year 1930 contains a wealth of information concerning the Company's large Dock system. There are many illustrations and plans of the various Docks, and full particulars are given regarding rates and charges, cold storage and transit sheds, hoists and cranes, cross-Channel services, equipment, rebates from Dock charges, steamship services, warehouses, etc. This publication also contains some very interesting trade articles. The following Ports are dealt with amongst others:—Cardiff, Swansea, Newport, Barry, Port Talbot, Penarth, Plymouth, Milford Haven, Neath Llanelly and Burry Port, Briton Ferry, Fishguard, Weymouth, and Brentford. The headquarters of the Chief Docks Manager's Department are at Bute Docks, Cardiff.

Port of London Authority.

THE traffic figures for the Port of London for the eight months from April to November, 1929, make very encouraging reading. The following statement shows at a glance the total tonnage of shipping that arrived at and departed from the Port during that period compared with the total tonnage of shipping that used the ports of the United Kingdom :—

Traffic during eight months ended November, 1929.

	Net reg. tons.	Percentage increase compared with 1928.
All U.K. Ports	255,456,280	7.7
The Port of London	39,605,279	5.6

The figure of 39,605,279 net reg. tons for the Port ot London, is a record in the history of the Port, and is 2,098,281 net reg. tons higher than the similar period in 1928, the previous best.

Analysed a little further, the figures show that the tonnage of vessels with cargoes using all the ports of the United Kingdom during the eight months in question, increased by 7.6 per cent., and that London's increase in this category was 6.2 per cent.

Nearly 62 per cent. of the shipping that uses the Port of London, is accommodated in the Port of London Authority's Docks and consequently the accumulated tonnage that used the docks during the eight months to November, 1929, was a record in their long history.

The Port of London Authority's figures for goods show that the quantity of goods handled by them was 7.2 per cent. (98,640 tons) higher during the eight months ended November last, than during the similar period in 1928. An increase of 15.2 per cent. compared with 1928 on the goods warehoused was largely accounted for by additional shipments of softwood. There were also additional arrivals of fruit, vegetables and paper.

The tonnage of exports handled by the Port Authority during the eight months, increased by 3.6 per cent. compared with 1928, the total of 497,742 tons being the best since the corresponding eight months in 1920.

London's prosperity is due to a combination of circumstances. First place must be given to the vastly improved dock accommodation and equipmnt provided by the Port Authority during their 21 years' régime, together with the dredging of a wider and deeper navigable channel in the river. The development of industry in the South is playing no small part towards increased imports and exports, and the economies effected by the Port Authority, together with the benefit derived from de-rating, have made it possible to apply reduced charges, which, in the aggregate, represent a saving to shipowners and merchants using the Port at the rate of over £250,000 per annum.

• • • •

Mr. J. D. Gilbert, D.L., J.P., has been re-appointed to represent the Port of London Authority on the Thames Conservancy for the next three years.

• • • •

The Port of London Authority have made certain reductions in the dues on ships using the docks of the Authority, and have adopted a revised schedule of such rates, which came into force on the 1st January last. The principal alteration relates to vessels in Class I, *i.e.*, vessels laden from or for ports outside Europe, outside the Mediterranean Sea and the Black Sea. The rate on these ships, which was 2s. 2½d. per net registered ton less 10 per cent., has been reduced to a net figure of 1s. 10d. per net registered ton. There are several other alterations and revisions which are more or less consequential on the reduction to Class I ships. The saving to Shipowners represented by the new schedule is estimated at about £75,000 per annum.

• • • •

Following upon the completion of the million and a quarter pounds improvement scheme at West India and Millwall Dock, vessels of larger size are now using that system.

• • • •

Works at the docks involving an aggregate expenditure of nearly £55,000 were reported to the Port of London Authority at a recent meeting as having been completed during the past few months. These works, which, in an undertaking of smaller magnitude than the Port of London would be regarded as of the first importance, include renewal of quays, railway and crane tracks, hydraulic mains, renewal of floors and glazing roofs of sheds, overhaul of machinery, relaying of roads, repairing of lock gates, equipment of offices, provision of sanitary and washing accommodation and drainage.

• • • •

The jurisdiction of the Port of London Authority extends from Teddington to an imaginary line between Warden Point and Havengore Creek (Essex), a distance of nearly seventy miles.

News from all Parts.

Parry, Leon & Hayhoe's Office at Beira.—At the request of many of their clients throughout Rhodesia and the Union of South Africa, Parry, Leon & Hayhoe, Ltd., the well-known steamship, shipping, forwarding and insurance agents, have opened an office at Beira, Portuguese East Africa, and can now give the same efficient service at Beira as it has been their pleasure to render at the other ports. The Company have their own offices and stores at Cape Town, Durban, Port Elizabeth, Lourenco Marques, East London and Johannesburg, at all of which places they maintain an efficient staff, thoroughly conversant with the many and intricate requirements of the Customs, Harbour and Railway Departments.

New Passenger Steamboat for the G.W.R. — Messrs. Alexander Stephens, Linthouse, Glasgow, have at present under construction a new Passenger Steamer for the Great Western Railway, which is expected to be launched on the 15th January. The new vessel will be a fine addition to the Great Western Railway Company's Channel fleets; its dimensions will permit it to be used as an auxiliary for the Channel Islands Service as well as the Irish Service, and it is hoped the ship will be completed early in March, and will be available for the daylight service to the Channel Islands during next summer. As an auxiliary to the present very fine boats, the "St. Julien" and "St. Helier," there is no doubt that the new boat will be very much appreciated by the Channel Island passengers. The dimensions of the vessel are 290 ft. long, 41 ft. beam, and 17 ft. moulded depth. The propelling machinery is the latest Parsons improved single reduction gear turbines, supplied with steam from four oil-fired boilers, designed for a pressure of 230 lbs., and the vessel is expected to attain a speed of nearly 20 knots on trial. Special care has been taken in the sub-division of the vessel by a large number of watertight bulkheads. All watertight doors being controlled from the Bridge, and every device is provided for the safety of the passengers. The vessel and machinery throughout is being built under Lloyds Special Survey and to the latest Rules and Regulations of the Board of Trade, and the vessel will accommodate 1,000 passengers. A number of single-berth cabins are provided, the remainder being two-berth cabins. As the vessel is both a "Summer" and "Winter" boat, provision is being made for portable cabins on the promenade deck, which can be removed during summer to provide a tea lounge on port and starboard sides. Sleeping Accommodation is provided for 216 first class, and 116 third class passengers. As much deck space as possible is provided for by a special deck on a level with the navigation bridge, as well as ample spaces on boat and promenade decks. The vessel has been designed to reduce, as much as possible, "top hamper," and the stability of the vessel has been carefully considered to give maximum comfort to the passengers.

White Star Line Cruises for 1930.—In the first few months of 1930, five White Star Liners with a total tonnage of 108,579, will make nine cruises to the west Indies, or Mediterranean and Egypt. During these cruises a distance of close on 100,000 miles will be covered, close on 50 ports visited. A new feature of the White Star Line cruise schedule is the inauguration of cruises from England to the Mediterranean. The "Megantic," has been specially chosen to make these cruises, the first sailing being from Liverpool and Southampton on January 18th and 20th, respectively, and the second from Southampton on February 8th. These two pleasure cruises will each last 19 days, and are Cabin class only, a fact which gives the tourists the run of the ship. The steamship fare for each cruise need not exceed £30.

Southampton Docks.—Although it is not yet possible to refer to actual statistics in regard to shipping activities at the Southampton Docks during 1929 it is nevertheless apparent that new records have been established for shipping tonnage entering, and the number of passengers passing through the Docks. In each instance the yearly total registered for 1928 was surpassed during the eleven months ending November, 1929, and it is highly probable that the shipping tonnage using the Docks in 1929 will exceed that of the previous year by 1,500,000 tons. In this connection it is interesting to note that the amount of shipping handled has shown a substantial increase each successive year since 1924. Southampton's position as premier passenger port of the United Kingdom will be even more securely established when the final figures for 1929 are published as the record total of 1928 has been eclipsed by more than thirty thousand. Since 1921 the number of passengers dealt with annually has increased by nearly 200,000.

News from the Ports.

Merseyside Area.

Liverpool Shipping and Forwarding Agents' Association.—At the December meeting of the Council of the Liverpool Shipping and Forwarding Agents' Association, Mr. G. C. Horton was re-elected chairman, and Mr. W. R. Lloyd, vice-chairman for the ensuing year. Mr. A. G. Taylor, of Sutherland International Despatch, Ltd., 17 Brunswick Street, Liverpool, has been elected a member of the Council. Strong and representative as is the Association, the Council is not satisfied to let well alone, and being of the opinion that every forwarding agent practising in the city should be a member, is about to embark on another membership campaign. Mr. S. Leslie Jude, the secretary, suggested to the Council at their December meeting, certain methods of approaching non-members and these were approved by the Council. The Dinner Committee of the Association held a meeting in the early part of January with the object of completing the arrangements for the Annual Dinner which will be held at the Midland Adelphi Hotel, Liverpool, on Saturday, January 18th. We are informed that amongst the principal guests will be:—The Lord Mayor of Liverpool; Sir Edwin Stockton, J.P.; Mr. A. W. Heard (chairman, British Association of Shipping and Forwarding Agents); Mr. F. J. Marquis (Liverpool Organisation); the Collector of Customs (Liverpool); the Postmaster (Liverpool); Mr. M. E. Duffett (President, London Shipping and Forwarding Agents' Conference); Mr. H. P. Lumb (Manchester Shipping and Forwarding Agents' Conference); District Goods Manager (L.M.S.); the Chairman, Liverpool and District Railway Conference; the President of the Liverpool Consular Corps; and representatives of the Mersey Docks and Harbour Board and the Liverpool Chamber of Commerce.

New Shipping Service.—The Leyland Line have opened a new direct shipment service of fruit steamers from Porto Rico to Liverpool.

Primage. — The British and African steamship companies notify traders that the primage of ten per cent. now being charged has been increased to 20 per cent., half of which is to be returned promptly and the other half is to be paid within seven months of the half yearly claim for it. In addition, substantial rebates are to be allowed on the net freights received, i.e., less primage, and are to be paid within two weeks of the receipt of the quarterly claims for them. The outcome of these rebates will be to reduce substantially the net rates for the large number of shippers who confine their shipments to the lines maintaining regular services.

De-rating Benefit. — As from the 1st January, reduced charges have been made for the haulage of traffic between the dock estate and the railway stations at Liverpool. These reductions have been made possible by the saving in local rates on the dock estate which will be brought about by the Government De-rating Scheme.

"Fiercely Competitive."—Sir Thomas Royden, chairman of the Cunard Steamship Company, addressing a meeting of employees said no trade in the world was so fiercely competitive as that of the steamship owner who was in competition with a large number of foreign companies who were supported by their Governments with subsidies and given every conceivable form of financial assistance. British companies had to rely on giving the finest steamship service in the world.

All's Well.—Mr. R. D. Holt, ex-chairman of the Mersey Docks and Harbour Board, announces that there has been a very considerable improvement in trade during the last few months and the port of Liverpool is in a very satisfactory position.

Consular Corps.—Mr. Alberto Phillips, Consul-General for Chile has been re-elected president of the Liverpool Consular Corps for 1930.

Dock Board's New Chairman.—Mr. A. W. Bibby has been elected chairman of the Mersey Docks and Harbour Board for the ensuing year. The re-election of Mr. Richard D. Holt for another year would have been proposed but for the fact he is going on a foreign business tour which, probably, will last six months. Mr. Bibby, who, for many years, has been the nominee of the Ministry of Transport on the Dock Board, is senior partner in the firm of Messrs. Bibby Bros., and Co., Liverpool and London, and is chairman of the Bibby Steamship Co., Ltd.

Manchester Area.

Manchester Conference.—Mr. H. P. Lumb presided over a good attendance of members at the December meeting of the Manchester Shipping and Forwarding Agents' Conference. Most of the business was of a private character and concerned items that had been brought forward from previous meetings.

Ship Canal Progress.—News of satisfactory progress comes from the Manchester Ship Canal Company. For the first eleven months of this year the gross revenue receipts showed an increase of £19,000 over the corresponding period of last year, the returns being £1,302,441 and £1,283,381 respectively. The expansion in traffic has been regular throughout the year, except in the month of November, when a setback was experienced, traffic receipts for that month being £1,128 less than in November, 1928. In recent months some improvements have been effected in the steamship services to and from Manchester. Recently the railways at the port of Manchester have been extended and new plant and equipment installed, where required, including a 60-ton floating crane. At the lower end of the Canal the policy of providing more and more facilities for receiving and handling cargo is encouraging trade, particularly at Ellesmere Port and Stanlow. The total oil storage capacity at Stanlow is now about 110,000,000 gallons.

New Shipping Services.—Amongst recent developments in the shipping services of Manchester is that of the Reardon Smith Line, which entered the Pacific Coast-United Kingdom trade a little over twelve months ago with a monthly service homewards. The service has since been increased to a fortnightly one. As Furness Withy also maintain a fortnightly service with the Pacific Coast ports it will be seen that importers interested in this trade have excellent steamship services with Manchester. The resumption of trade with Russia has resulted in several steamers loading at Manchester, principally with textile machinery. Sailings have been at monthly intervals, and it is anticipated that the service will be continued and possibly increased.

Beneficial to Manchester.—The trade of the port, states the Manchester Ship Canal Co., should be favourably influenced by the recent decision of the Liverpool Corn Trades Association to amend its Future Delivery Contract form to include the tender of wheat at Manchester. Under the new contract wheat is deliverable ex store in Liverpool or at seller's option ex the grain stores of the Manchester Ship Canal Company at Manchester Docks. The storage room available to shippers has been enormously increased. The two grain elevators at Manchester Docks have a capacity of 3 million bushels (80,000 tons).

Shipment of Locomotives.—The dispatch of locomotives is becoming a feature of Manchester dock traffic. In November, twelve locomotives and tenders were shipped for India and two sleeping coaches for Port Sudan. The locomotives and tenders, which were shipped fully-assembled, were destined for the Bombay, Baroda and Central Indian Railways and the Assam-Bengal Railways.

Tyne and Tees Area.

Tyne Shipbuilding. — During 1929, the returns show, 69 vessels, of 284,161 total gross tons, were launched on the Tyne, as compared with 70 vessels and 315,012 tons in 1928—a decrease of one vessel and 30,851 tons. Only six firms are in operation, or about half the number there used to be before the war; but the capacity for production is very large, as the facilities are equal to all demands. Swan, Hunter, & Wigham Richardson, Ltd., again led in 1929, with an output of 28 vessels of 99,797 tons. The shipbuilding prospects on the Tyne for the present year are good, thanks mainly to the large number of oil tankers ordered for Norway. The total output of ships on the North-East coast is 206, with a tonnage of 729,417 tons.

Two Big Schemes.—For years the cross-river facilities at Shields and the future of Jarrow Slake have been debated, but now definite moves forward are announced. Thus, a survey is to be made officially in regard to the bridge or tube railway that is proposed at the mouth of the Tyne, which would give a continuous road from Berwick down the coast to Hull. Matters are progressing even more swiftly in connection with the future of Tyne

Digitized by Google

Dock and the development of Jarrow Slake; and the making of a 1,000 feet dry dock is even hinted at as within the bounds of probability.

Scotswood Bridge.—Newcastle City Council has decided to carry out the strengthening and widening of Armstrong Bridge, in conjunction with Durham County Council, at a cost of £32,400, to which there is a Government grant of 60 per cent.

Proposed New Dry Docks.—Sir George Renwick, ex-M.P. for Central Newcastle, is promoting a dry docks enterprise for the Tyne which should eventually provide work for 3,000 men. The site of the projected docks is the Renwick and Dalgliesh shipyard at Hebburn, an enterprise of Great War days which was completed just when the slump in shipbuilding commenced and has now been abandoned. Two docks are planned, each 600 to 700 ft. long. Sir George was one of the founders of the Manchester Dry Docks Co. in 1893 and has been its chairman ever since. Ten years earlier he formed the Tyne Pontoons and Dry Docks Co., afterwards sold to Swan, Hunters.

Humber Area.

Dock Extension at Hull.—Hull shipowners and merchants who have been pressing for some years for the completion of the King George Dock are pleased to know that the matter is at last receiving the active attention of the London and North Eastern Railway Company. A letter received by the Chamber of Commerce and Shipping from the Company intimates that the plans and estimates are well in hand for the south-west arm, the construction of which was interrupted by the war. The continual increase in the number of large-sized steamers visiting Hull makes the provision of this extra space absolutely imperative.

Stimulating Trade.—The Hull Development Committee is serving a very useful purpose in endeavouring to stimulate the trade of the port. It ascertained that trade was being lost to Sheffield owing to the lack of direct shipments between Hull and Calcutta and promptly took steps with the local companies interested to investigate the possibilities of setting up a line. The Aberdeen and Commonwealth Line, which maintains a regular service between Hull and Australia, made representations concerning the system in vogue in Hull of weighing Australian wheat, and the suggestion was advanced to the Corn Trade Association and the Chamber of Commerce that bags should be weighed four at a time. A number of other proposals have also been brought before the Chamber of Commerce with the view to improving the methods of discharge so as to increase the attractiveness of Hull as a port for liners sailing to a fixed itinerary.

Clyde and Forth Area.

Port Developments.—The report by the Port Facilities Committee which was appointed by the Chamber of Shipping of the United Kingdom recommends that the Port of Glasgow is one at which sound schemes of development are urgently required. The completion of the docks at Shieldhall is advocated.

Oil Tanker Repaired. — The Grangemouth Dockyard Co., Ltd., have completed extensive temporary repairs and strengthening work on the oil tanker motor ship, "British Chemist," which was seriously damaged some weeks ago by an explosion which took place on board the vessel. Before the damage to the ship's side could be dealt with she had to be listed to port to an angle of about 14 degrees and this was done by filling the undamaged port tanks. The portion of the shell blown out and hinged over was thus left exposed clear of water and was cut off by means of pneumatic cutting machines driven by compressed air obtained from the main compressor of the vessel. As can be understood the work had to be carried out under difficult conditions, but the Grangemouth Dockyard Coy. completed the big task in the most expeditious manner.

Too Steep Bridge. — The structure of the proposed bridge over the Clyde, at Finnieston, is causing some concern. The gradients at either end of the bridge are said to be too steep. A deputation comprising representatives of the Glasgow Horse and Motor Contractors' Association, the Scottish Co-operative Wholesale Transport Department, Messrs. Wordie & Co. and Messrs. Cowan & Co., carting contractors, and the L. & N.E. and L.M. & S. waited upon the sub-committee of the Corporation. The representatives pointed out that the proposed gradients were too steep for horse traffic and the Committee agreed to continue further consideration of the matter.

Obituary. — Two well-known gentlemen in shipping circles have passed away. Mr. William Brown, C.B.E., was the Managing Director of William Simons & Co., Ltd., Renfrew. Shipbuilding and engineering on the Clyde have lost in Mr. Brown one who was associated with development and progress for over 60 years. The late Mr. James Cormack was head of the firm of James Cormack & Co., Leith, who carry on an extensive trade with the Baltic ports. For a number of years Mr. Cormack represented the shipowners on Leith Dock Commission.

Methil Dock.—Mr. Thomas Stenhouse, Traffic Superintendent at Methil Dock, has retired after over 50 years service on the railway. He was a very popular figure and he carries into retirement the esteem of the shippers and merchants in the busy Fifeshire port.

South Wales Area.

Tippers and Trimmers Refusal.—The shipping congestion at South Wales ports arising from the large arrivals of vessels, delayed by storm weather, together led to the Employers Section of the South Wales Area Trimming Board requesting that from December 19th to after the Christmastide trimmers should work an extra two hours per shift with payment at eighteenpence per hour beyond scale in order to avert ships being diverted from the Bristol Channel ports. Notwithstanding that on December 19th, 58 vessels were awaiting berths and 250 vessels were expected to arrive at any time, the men's side of the Board declined the proposal. At Swansea the L.M.S. Coy. militated matters somewhat by putting on an extra gang. The men's argument was that a "state of emergency did not exist."

Hague Conference Results.—The Italian State Railways are now preparing to accept tenders for supply of 1,000,000 tons of Welsh and North Country coal for 1930 use, which was agreed upon at the Hague Conference. It is believed that the bulk of the deliveries will be Monmouthshire coals as these were specially favoured in the days when the Italian State Railways took, annually, 3,000,000 tons of Welsh coal. The representative of the Italian State Railways, Signor Dott. G. Mastrocinque has arrived at Cardiff to take charge of the shipment and supervising of the contracts. He is well known in South Wales, having in 1907 opened at Cardiff the Italian State Railways office, remaining until 1909 and returning in 1916 until 1919. He was subsequently head of the Italian Coal Commission at Essen, being in charge of the transit of reparation coal to Italy.

Obituary.—The death has occurred of Mr. J. Ralph Williams, Whitchurch, a well-known Cardiff docksman and a former director of Messrs. Watts, Watts & Coy., Cardiff and London.

Cardiff Steel Trade Development.—The largest blast furnace in the British Isles was "blown in" at Messrs. Guest, Keen and Nettlefords, Ltd., Dowlais Steel Works, East Moors, Cardiff, late in December. The furnace has an output capacity of 4,000 tons per week and will increase the Cardiff steel output by this amount. The second largest blast furnace, with 3,700 tons weekly output capacity, is at the same works.

Tin Plate Trade Prospects. — The prospects of the Welsh tin plate export trade for 1930 are on all hands reported very bright. Most manufacturers report being "well sold" over the first six months of the 1930 year. In 1929, an average working of 75 per cent. capacity was reached by South Wales tin plate works and at least ten per cent. increase is estimated for 1930.

Irish Ports.

Freights on Exports and Imports between the Irish Free State and Great Britain.—At a meeting of the Irish Cattle Traders' and Stock Owners' Association, held in Dublin, the question of high freights on exports and imports between the Irish Free State and Great Britain was discussed, and a resolution, on the proposition of Senator Counihan, was adopted as follows:—"That the Executive Committee of the Irish Cattle Traders' and Stock Owners' Association having regard to the exorbitant freights on exports and imports to and from Great Britain, due to lack of shipping competition at Irish ports, and to the fact that 95 per cent. of such exports and imports are with Great Britain, request the Free State Government to open up negotiation with the British Government with a view to the passing of legislation establishing a joint tribunal to fix maximum rates of freight between the two countries for live stock, agricultural produce, and all classes of merchandise passing between both countries." Copies of this resolution were directed to be sent to the President of the Free State Executive Council, and to the

Digitized by Google

Minister for Industry and Commerce. At the meeting it was incidentally learned that a Conference was to be held early this year between the transit companies and representatives of the producers and traders to consider the question of freights.

The Port of Sligo.—At the Annual Meeting of the Sligo Harbour Board, Mr. H. Campbell Perry was re-elected Chairman. In his address Mr. Perry referred to the improvements that were being made by the Harbour Board, and said that in view of the tendency for ships to become larger, the Board had decided to extend the new jetty by a further 24 feet, which, when completed, would give one continuous concrete jetty that would be 247 feet in length, and would accommodate any vessel likely to visit the Port of Sligo. In a review of the trade of the port during the past year, the chairman said that the figures would convince everyone that Sligo as a port on the north-west coast of Ireland was very much alive, and well to the front as a trading centre. The total revenue of the Harbour Board from shipping for the year ended November 30th, 1929, was £10,958, an increase of £602, over 1928; harbour dues for the past year were £3,324; import dues, £4,656; and export dues, £706, all of which showed increases compared with 1928.

Newry's Trade with Liverpool.—Mr. D. Barry, General Manager of the British and Irish Steampacket Company, recently intimated to the Newry Port and Harbour Trust that it was the intention of the Company to place a modern and up-to-date vessel on the Newry-Liverpool service by August next, provided that the Newry Canal was made fit for the passage of a steamer of 3—4 feet beam, otherwise the service would have to be suspended. The Harbour Trust decided that Mr. Barry's letter should be referred to a joint committee of Newry Urban Council and Harbour Board, as it was considered that it would be a serious matter for the port if the cross-Channel service were suspended at any time.

Newport Chamber of Commerce.

A VERY influential company met on the occasion of the Annual Dinner of the Newport Chamber of Commerce, under the Chairmanship of Mr. H. Ivor Smith, the President. Amongst those present were:—Rt. Hon. Sir Halford Mackinder, P.C., Mr. W. P. Miles, the High Sheriff of Monmouth, Councillor W. H. Brinsmead Williams, Mayor of Newport, Principal J. F. Rees, University College of South Wales, Mr. T. H. Mordey, Jr., J.P., President, Cardiff Chamber of Commerce, Mr. Chubb Jones, President, Swansea Chamber of Commerce, Mr. A. W. Heard, Chairman, British Association of Shipping & Forwarding Agents, Mr. M. E. Duffett, Chairman London Shipping & Forwarding Agents, and the Secretary, Councillor A. E. Pugh. It is interesting to record that Mr. W. E. Heard, of Jones, Heard & Co., one of the founders of the Chamber of Commerce, who occupied the position of President in 1889, is still enjoying good health at the advanced age of 93 years, and is very highly respected and honoured in Newport.

After dinner had been enjoyed, some excellent speeches were delivered dealing with the various toasts. The speakers included, Mr. T. H. Mordey. The Mayor of Newport, Sir Thomas W. Allen, Principal Rees, Mr. W. P. Miles, Mr. Chubb Jones and the Rev. Father D. Hickey. The speech of the evening, which was listened to with the closest attention by those present, was that delivered by Sir Halford Mackinder, the guest of the evening, who said he had been asked to be present that evening with the question on the lips of his hearers—"Watchman, what of the Night?"

Setting forth the position as he saw it, the speaker said there were certain things done upon which they were all agreed. They were importing more than ever, but they were exporting less than immediately before the War. There were more employed in this country than ever before, but they had also large numbers of unemployed. What was the matter? England's position at this time was, that she was suffering from the change of life! They were adapting themselves to a new condition of the World, and it was not a pleasing process. Rationalisation was not an agreeable process for those who were subject to it. It meant the side-tracking of many highly deserving people. Sir Halford quoted a sentence from a poem which he considered one of the greatest: "Wisdom lies in the masterful administration of the unforeseen."

Britain might retain the carrying trade and the banking trade, but ultimately the only basis on which she could be safe was that she should export the products of her industry. It was the trade of the united Empire with the outer World, which would be the basis of the prosperity of the British race of the future. That was true Imperialism; that was to give a real economic meaning to the Commonwealth of nations.

Overseas News.

Czechoslavakia. Imports and Exports of Motor Cars.—The Czechoslovak motor manufacturers are asking the Government to extend to the motor works the stipulations contained in Article 5 of the Convention relating to the abolition of restrictions on imports and exports that comes into force at the beginning of July. This Article allows of the maintenance or introduction of restrictions on imports and exports when the existence of certain brands of production is considered to be at stake.

Poland to Buy Four Cargo Boats.—A Warsaw message says the Ministry of Trade and Commerce has decided to purchase abroad four cargo boats in order to establish a new steamship line between Gdynia and the North Baltic ports.

New America-East Indies Line. Five New Vessels to be Used.—The Norwegian Klaveness Line is commencing a new service between American Pacific ports and Java and Sumatra. The route followed will be:—Shanghai, Hong Kong, Singapore, Penang, Belawan, South Sumatra, Java, Macassar and Balik Papan, whence steamers will return direct to America. The service on the North China route is to be provisionally combined with the Dutch East Indies service, but it is intended to maintain the Dutch Indies service with five new motor ships, namely, the "Pleasantville," "Cornville," "Roseville," "Granville," and "Leoville," each of 9,000 tons deadweight. The new line refuses to join the Dutch East Indies Freight Conference, and sharp competition with the Java Pacific line is to be expected shortly.

Spanish Mercantile Marine.—In order to stimulate national shipping enterprise, the Spanish Government has nominated a special committee, consisting of the Ministers of the Navy, Finance and Public Works, to draw a programme up for the expansion of the Spanish merchant marine, which now consists of 73,400 tons of sailing and 1,130,000 tons of steam and motorship. The new programme will provide for the construction of several high-speed liners and the institution of more frequent sailings between Spain and the United States, with New York as the terminus. The Committee will present a detailed report to the Government early this year.

New American Mail Boats. Postmaster General's Programme.—A Washington message says that the Postmaster General has announced that the replacements of ships on the thirteen ocean mail routes proposed by the Post Office Department would reach a total cost of 245,000,000 dollars (£49,000,000). The ships which will be built under this new construction programme include three Class One vessels of 45,000 tons with a speed of 28 knots, of which the total cost would be 90,000,000 dollars and which would ply on the North Atlantic route from New York to Cherbourg and Southampton, to be completed within six years; also four Class Two vessels, costing 32,000,000 dollars, to be completed within eight years for the New York-Plymouth-Cherbourg and Hamburg route; and four Class Three ships, costing 16,000,000 dollars, for the New York-Plymouth route, to be completed within eight years.

Dredges Required in Mexico.—A Mexico City message says that the Federal Government will shortly place orders for four large dredges, at an average price of 500,000 pesos (£50,000) each. The first delivered will be used for dredging the harbour of Vera Cruz, which, with an area of 550 acres, is the most important sea-port in Mexico.

Belgian Shipping Companies to Amalgamate.—It is announced that following a conference between the Ministers of Finance and Transport with the Minister of State, M. Francqui, an agreement was reached for the fusion of the Compagnie Maritime Belge du Congo and the Lloyd Royal Belge and the constitution of a new company with a capital of 150 million francs.

REUTERS TRADE SERVICE.—By special arrangement with Reuters Trade Service we are publishing news items from all parts of the world dealing with transport matters.

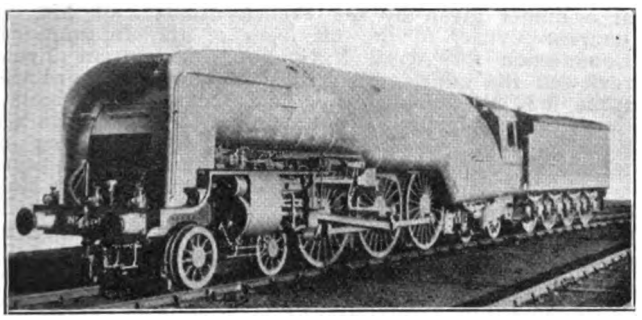
Railway Notes and News.

New Wonder Engine for the L.N.E.R.—The London and North Eastern Railway Company have recently completed a new locomotive of unique design for use on their East Coast Route express passenger services. In outward appearance this new engine is an entire departure from previous practice in locomotive design in this country and many of the constructional details are very novel. The boiler has been constructed to the extreme limits of the railway gauge and there is no room for a chimney to project above the boiler. The chimney has, therefore, been sunk within casing plates, which are so arranged as to throw the smoke upwards and clear of the driver's view from his position on the footplate. Considerable experimenting was undertaken, and the new outstanding design was arrived at by tests which were made with a model of the locomotive in a wind flume with air currents of speeds up to 50 m.p.h. The results indicate a bold departure from the conventional appearance. The importance of the engine driver of a modern express train having a perfectly clear view ahead is a matter of safety. The locomotive possesses the unusually high boiler pressure of 450 lbs. per sq. inch, which is the highest pressure which has ever been used for a British railway locomotive. The pressure hitherto used has been between 200 and 250 lbs. This high pressure has necessitated the use of a boiler of the water tube type, which has never previously been applied to a locomotive. The object of using high pressure is fuel economy. The new engine possesses a



THE L.N.E.R. HIGH PRESSURE COMPOUND EXPRESS LOCOMOTIVE NO. 10,000, REFERRED TO IN TEXT.

wheel arrangement 4—6—4, known as the "Baltic" type, this being the first tender locomotive with this wheel arrangement to be constructed and operated in this country. The 6 coupled driving wheels are 6 ft. 8 in. in diameter. One of the most striking features is that the whole of the air supplied to the firegrate is pre-heated, the supply being taken from the front of the smokebox, passing down a space between the boiler and the casings. The engine is a 4-cylinder compound. The two high pressure cylinders which are made of cast steel (a new feature) are 12 in. in diameter and 26 in. stroke driving on to the leading coupled wheels. The two low pressure cylinders are situated outside the frames and drive the intermediate pair of coupled wheels. They have a diameter of 20 in. and a stroke of 26 in. The new engine has been constructed entirely of British steel by British workmanship to the designs and inventions of Mr. H. N. Gresley, C.B.E., Chief Mechanical Engineer of the London and North Eastern Railway Company, and was constructed at the Railway Company's works at Darlington, the high pressure water tube boiler being supplied by Messrs. Yarrow and Company, of Glasgow, the well-known makers of marine water tube boilers, who collaborated with Mr. H. N. Gresley in the production of this unusual component. The engine is the longest and heaviest passenger locomotive in Great Britain, weighing with its tender of the well-known Flying Scotsman corridor type, nearly 170 tons.

Mr. R. H. Selbie's New Year Message.—The following New Year message from Mr. R. H. Selbie, Chairman of the Railway General Managers' Conference, is printed in the January issue of the *Railway Newsletter*:—The year that has just closed has been brighter than its predecessor for railway interests. Traffics generally have been better and the Companies mainly responsible for the heavy business, particularly coal for shipment, have shown substantial increases in gross receipts. Passenger traffic still lags behind in spite of the efforts made by the Companies to encourage it by means of special and reduced fares and improved services. There has not yet been time for the effect of the various agreements which have been entered into between the Railway Companies and the Proprietors of the principal Road Services to be felt but, if the usual result follows the elimination of unreasonable competition, the Railway Companies' passenger receipts should soon be once more on the upward grade. The working expenditure of all the Railway Companies has been assisted during the past year by the deduction of 2½ per cent. from salaries and wages which was first arranged by agreement with the Railway Trades Unions for a period from August, 1928, to November, 1929, and has since been renewed by mutual agreement for a further six months. The fact that it has been possible to make and to renew an agreement of this character without any outside interference is clear evidence of the better understanding that exists between railwaymen and their employers, and should go a long way towards re-establishing the confidence of the public in railway investments. There are signs of an awakening to the fact that, as the railways have long since ceased to hold any monopoly of the transport work of the country, they must, if they are to fulfil their proper functions, be freed from many of the hampering restrictions placed upon them when that monopoly existed. A great vista of possibilities is opened up by the introduction of this question and it is hoped that the coming year may see some progress made in their exploration. We look forward with great interest and no small amount of confidence to the year 1930.

News from the G.W.R. Magazine. — Writing in the January issue of the G.W.R. Magazine, Mr. James Milne, C.S.I., the General Manager of the Great Western Railway, says:—"My predecessor, Sir Felix Pole, was able to pay tribute to the staff of all departments on the results of their efforts during the previous year. To-day, I am proud to be able to record that still further progress has been made during the year that has just closed, and I venture to say that when the results of the year's working are published, they will demonstrate that the Great Western Railway continues to hold its high place in the world of transport. I would like to take this opportunity to thank all the officers and staff for the loyal support which they have given me since my appointment as General Manager. With a continuance of this support, we can look forward to further progress in 1930." The G.W.R. have 530 containers available for use in connection with the conveyance of various types of traffic. The first system of regional control of cartage operations has been established at Marlborough, embracing some 76 stations and 16 country lorry services. This scheme affords cartage facilities over an area of 1,000 square miles. Just a year ago on January 1st the first of the Rail-Road agreements sanctioned under the Railways Road Powers Act was announced. Since that time the Company have acquired a financial interest in practically all important Road Transport undertakings operating in G.W. territory.

Big G.W.R. Programme for 1930.—In addition to the £5,000,000 to be spent in connection with the Government's schemes to relieve unemployment and the £700,000 the capital equivalent of the Remission of Passenger Duty, the following items are included in the G.W.R. programme for 1930:—161 new passenger vehicles, 30 milk and perishable traffic vehicles, 2,771 freight wagons, 10 King class locomotives, 20 Hall class locomotives, 70 tank engines, 100 horse-drawn vehicles, 56 trailers, 21 modern type weigh-bridges, a new steamer for Fishguard-Rosslare route.

More Large Wagons for the L.N.E.R.—The L.N.E.R. are to construct 25 additional fifty-ton wagons for the conveyance of bricks and 125 twenty-ton wagons for the carriage of locomotive coal. This is in accordance with the London and North Eastern Railway Company's policy of providing large wagons wherever they can be usefully used. Wagons, each of which will hold forty tons, have been used by the L.N.E.R. for the past 27 years to carry coal from the Ashington Collieries to Blyth for shipment. At the present time there are 130 of these wagons in use. Wagons holding forty tons of coal are used for engine purposes.

Air Transport Notes.

Imperial Airways.—A recent issue of "Imperial Airways Gazette" contains some interesting information. The following statistics include for the first time the total figures for the European services, the Cairo, Baghdad, Basra service, from 1926 to March, 1929, and the England-India service, from March, 1929, until the end of October last. From April 1st, 1924, to October 31st, 1929. Miles flown, 5,328,663; passengers carried, 127,889; freight carried (tons), 4,189.5. Imperial Airways have recently taken delivery of the first three-engined small aeroplane, specially designed for long distance "air taxi" work. Several air traffic records have been broken recently. The total number of passengers carried across the Channel during October was far in excess of the figure for the month in any previous year. Although not actually the fastest on record, several remarkably rapid flights have been completed recently in 18-seater Argosy type air liners. The 320 mile journey from London to Cologne was covered in a flying time of only 145 minutes, which is the equivalent of 132 miles per hour over the ground. The same journey takes from 15 to 20 hours by boat and train. A sister ship carrying 17 passengers and a crew of three flew from London to Paris, 225 miles, at an average ground speed of 145 miles per hour. The first triple engined aeroplane which has been designed specially for long distance special charters, was recently taken delivery of by Imperial Airways. It is a Westland IV Cabin Monoplane. This little Monoplane has one long wing which passes right over the Passenger Cabin and is the highest part of the aeroplane. Four passengers are accommodated in an extremely comfortable cabin. Each has a separate cushioned arm-chair, two being arranged to face forward, and the remaining two aft. A small folding table is fixed beside each chair. The cabin is decorated in polished mahogany and whitewood, with curtained windows and a carpeted floor. Fitted above the windows are the usual racks for light luggage. The cabin is also fitted with a clock, and height and speed indicators, and by a system of ventilation, the temperature can be regulated at will by the passengers. A lavatory is situated aft of the passengers' saloon, and alongside the baggage compartment. As the passengers are seated under the wing they have an uninterrupted view of the ground below. The pilot and pilot engineer sit in an enclosed cockpit which is forward of the passenger cabin with a communicating door between. All the usual instruments and controls are included, and there is a fitting which is often seen on motor vehicles, but seldom on aircraft; a mirror in which the pilot can see the tail, also whether everything is clear, both in the air and on the ground, before he takes off. The landing wheels incorporate brakes which are designed to facilitate landing and taxying in confined spaces. The wide track of the wheels is an advantage for a 'plane used on special charters, as it sometimes is necessary to visit aerodromes where the ground is uneven. The widespread points of contact aid stability considerably when landing, taxying, or taking off. Power is provided by three Cirrus-Hermes engines, a higher powered development of the engine which was used on the light aeroplanes in which Squadron-Leader Hinkler flew to Australia, and Lady Bailey round South Africa. With the total horse power of 300, a cruising speed of 90 miles per hour is attained, and the machine can maintain height on two engines.

Cardiff's Aerodrome. — The Cardiff City Council has acquired a large site off the Splott foreshore for lay-out as an aerodrome and aeroplanes landing ground. The Council is to spend £17,000 on the development of this site, the work to be done including the building of a wall to bound off the site from the foreshore. Approval of the works has already been given.

Aerodrome Site for Swansea.—The Air Ministry has now suggested to the Swansea Council that the only suitable site for a municipal aerodrome for Swansea is at Fairwood Common, and the Swansea Parliamentary and General Purposes Committee has decided to expend all necessary monies in acquiring and developing the site.

Handley Page Clive.—In the December issue of the "Handley Page Bulletin" interesting details are given of the Handley Page "Clive." It is pointed out that the increasing importance which the British Royal Air Force authorities are attaching to heavy transport aircraft, or, as they are more generally called, troop carriers, was made clear in the report on the Kabul operations. The latest type of troop carrier ordered by the Royal Air Force is the Handley Page Clive. The design of the Clive has been largely the result of extensive experience with the Hinaidi. It is in every way a general purpose machine, and can be used for the transport of troops or supplies or as a bomber. It is by no means defenceless like some of the earlier troop carriers. In fact, it has been the deliberate aim of the designers to make the Clive a Service machine in the true sense of the word. With this object in view, two gun positions are provided with Scarff type rings. One is in the nose of the fuselage while the other is in the rear. Particular attention has been paid to attaining the highest possible degree of manœuvrability both in the air and on the ground. The fuselage is of metal, and is rectangular in section. It is covered with doped fabric. From the troop transport point of view the cabin has many new and interesting features. There is a row of windows on either side covered with gauze. Gauze is used to keep the cabin airy and comfortable, especially in hot climates. Folding seats are arranged along both sides of the cabin, and there are racks for the rifles. The Clive carries seventeen fully-armed men. There is accommodation in the cabin for two stretchers, the special large door enabling stretcher patients to be moved in and out with the least disturbance. Sling gear is provided over the door on the port side of the fuselage, and, if necessary, three spare engines and other weighty equipment may expeditiously be loaded into the cabin. Extra tanks for petrol may be carried either to increase the machine's range or for the refuelling of other aircraft after forced landings or at advanced aerodromes.

International Air Relations.—A Paris message says that at a dinner given by the French Minister of Air, M. Laurent Eynac, to the members of the International Commission for Aerial Navigation, M. Laurent Eynac reviewed the efforts of the Commission to co-ordinate from judicial, administrative and technical standpoints the rules applying to international aerial navigation. Such an aim, the Minister declared, by furthering international communications advanced the cause of peace and civilisation. The Canadian Minister, the Hon. Philippe Roy, spoke of the growth of aviation in Canada, and Air Vice-Marshal Sir Sefton Brancker summed up in a few words the importance of the ever-increasing development in the air services between Great Britain and the Continent.

£20,000 Prize for Aviation. Awarded to Curtiss Machine.—The first prize of £20,000 in the International Safe Aircraft competition organised by the "Daniel Guggenheim Fund for the promotion of Aeronautics" for the machine demonstrating the greatest advance in aerodynamic safety without loss of efficiency, has been awarded to the entry of the Curtiss Aeroplane and Motor Company, of the United States, says a New York message. Twenty-seven manufacturers entered planes, but only fifteen presented machines at Mitchell Field, Long Island, for testing and the Curtiss was the only entry to pass all the qualifying requirements. The judges included Mr. Orville Wright, the inventor, Mr. F. T. Davidson, Assistant-Secretary for War, Mr. W. P. MacCracken, Jr., and Admiral Byrd the famous Arctic explorer.

New International Air Port.—It has been decided to establish an international air port for aeroplanes and seaplanes at the Lac du Bourget, near Aix-les-Bains, Savoie.

Development of Air Transport in Spain.—The popularity of air travel in Spain has spurred the Supreme Air Council to further efforts, and there is every prospect that this year will see a big extension of passenger and mail services. According to official returns, the daily service from Madrid to Barcelona and Seville has been well patronised, none of the big three-engined 'planes having to make the journey empty. On many occasions they have had to leave passengers behind because all available accommodation was taken. The new lines under consideration would be one to Cape Juby (North Africa) and thence to the Canary Islands and another from Barcelona to the Balearic Islands. For the Balearic Islands, seaplanes would be used exclusively and for the Canaries, aeroplanes would make the link between Spain and Cape Juby and amphibians would be used for the rest of the distance. So far nearly all the machines employed for the services have been imported from abroad, but arrangements are being pushed forward for the erection of aircraft factories in Spain.

Merseyside Notes.

FROM OUR OWN CORRESPONDENT.

Liverpool Cart and Motor Owners' Association. — Arrangements are being made for the Annual General Meeting of members of the Liverpool Cart and Motor Owners' Association. This will be held towards the end of this month in the Common Hall, Hackins Hey, Liverpool.

Municipal Transport Officer.—At the January meeting of the Liverpool Corporation Health Committee, a motion will be submitted to the effect that a transport officer be appointed to be responsible for the supervision of all transport connected with the Committee.

Institute of Transport.—The next meeting of the Manchester and Liverpool and District Section of the Institute of Transport will be held at the Midland Hotel, Manchester, on 24th January, when Mr. C. Travis will speak on the subject of "The Railways of Africa."

Proposed Purchase of 50 Buses.—Liverpool Corporation Tramways Committee recommended the City Council at its meeting on 2nd January, to accept the following tenders:—20 Karrier 6-wheel 6-cylinder chassis at £1,010 each; 10 Guy 6-wheel 6-cylinder chassis at £1,012 each; 10 Thornycroft 6-wheel 6-cylinder chassis at £910 each; 10 Vulcan 4-wheel 6-cylinder chassis at £715 each.

Liverpool Short Cart and Motor Owners.—At the time of writing, the date of the Annual Meeting of the Liverpool Short Cart and Motor Owners' Association has not been fixed, but the writer is informed that it will probably be held towards the end of this month. Trade is fairly satisfactory, but what distresses short cart and motor owners is the decision of the Liverpool Corporation Health Committee to give the first preference for available work to the municipally owned stud of horses and wagons.

Personal.—Mr. C. F. Rymer, of Rymers Motor Tours, has returned to Liverpool after a business tour in Canada and the U.S.A., where he has been gathering impressions on different aspects of transport. He considers that Liverpool, with its "tramways mind" is too conservative in transport methods.

Transport Men at Dinner.—Members of the Port Sunlight Traffic Department held their Annual Dinner on December 20th. Mr. G. B. Lissenden presided. This was primarily a "family gathering" and such speeches as there were, were brief and seasonably felicitous.

Horse Haulage Preferred.—Liverpool short cart and motor owners have been a little perturbed by the decision of the local Health Committee that in future no motor wagons be hired until all the Health Committee's horses are fully employed. The respective merits of horse and motor haulage are dealt with in reports by the City Treasurer, the City Engineer, and the Chief Veterinary Officer, and after considering these, the Committee decided by nine votes to six that the Corporation stud of horses be maintained at its usual strength. A proposal that the question be postponed for three months, pending further and better tests of the two systems, was defeated.

18 Tons Limit.—A firm was summoned at Birkenhead for permitting a steam wagon and a trailer owned by them to exceed the maximum regulation weight allowed on the Woodside floating roadway. The lorry was loaded with cases of machinery. The driver said he was not responsible for the load; he was only paid to drive. It was found that the wagon weighed 12 tons, 5 cwts., 1 quarter, and the trailer 7 tons, 8 cwts., 2 quarters, making a total weight of 19 tons, 13 cwts., 3 quarters. The maximum weight allowed was 18 tons, and defendants weight was consequently 1 ton, 13 cwts., 3 quarters above the weight allowed. Defendants were fined 20s.

Motor Bus Tyre Tenders.—Tenders submitted by the Dunlop Rubber Co., Ltd., and Henley's Tyre and Rubber Company, Ltd., for the supply and maintenance of motor omnibus tyres for the twelve months ending 31st December, 1930, has been recommended for acceptance by the Liverpool Tramways Committee.

A Close Preserve.—Birkenhead Town Council has decided not to grant permission to Rymer's Tours, Ltd., Liverpool, Dutton's Motors, Hoylake, and the Tourist Motor Coaches (Southampton), Ltd., to ply for hire in the town for long distance services.

Co-operation.—A working arrangement has been entered into between the Wrexham and District Motor Transport Company and the Great Western Railway Company in connection with the future bus service in the Wrexham area. It is understood that the operation of the service will remain virtually under the control of the Transport Co., and it is probable that the area over which the service operates will be extended.

Road Traffic Bill.—Sir Josiah Stamp was one of the principal speakers at the Annual Dinner of the Liverpool Shipbrokers Benevolent Society. He said he regarded the draft Road Traffic Bill as going a good way towards the solving of the traffic riddle. He particularly hoped that the restrictions dealing with the dangers of the road would pass into law. The whole question of co-operation between not only road and rail transport, but with coastwise shipping services as well, was receiving close consideration and would help, he believed, in a solution of the problem industrially and financially. Sir Percy Bates, who urged the need of co-operation between the four Merseyside boroughs, said "transportation is the biggest thing in civilisation, and unless we realise that we shall be back numbers."

More Buses for Morecambe. — Morecambe-Heysham Corporation intends to borrow £2,600 for the purchase of four omnibuses.

To Go Forward.—Lancashire County Council has decided that "pending further information with regard to the Government Road Traffic Bill, the Bill promoted by the Lancashire County Council for the establishment of a traffic board and area committees for Lancashire should be proceeded with and deposited in Parliament."

Report on Trolley Buses.—Liverpool Tramways Committee submitted to the City Council on 2nd January a report on the relative merits of trackless trolley vehicles and petrol buses. "Liverpool Corporation" states the report, "has no Parliamentary powers to operate trackless trolley vehicles, but such powers are being sought in the Bill which is now being promoted by the Corporation. Trackless trolley vehicles have been tested in connection with different undertakings and adopted chiefly in the smaller towns. They form a type of vehicle between the tramcar and the petrol driven bus, and as such might be of service on established routes where there is not sufficient traffic to justify renewal of the permanent way, but more traffic than can economically be met by the operation of the petrol driven motor bus. From particulars obtained from other towns, it is found that the running costs per car mile of the trackless trolley vehicle are slightly lower than those of a tramcar, but the annual capital charge per car mile is higher, and as it is of smaller seating capacity than the tramcar, the costs per seat mile are in favour of the tramcar, which is the most economical vehicle to operate in well populated districts where frequent services are required. Trackless trolley vehicles are cheaper to operate than motor buses if a reasonable frequent service is required, but in new districts where only an infrequent service is required, the petrol bus is cheaper, as the capital expenditure is much less than for inaugurating a trolley bus service. Each district needs separate consideration as to which is the most suitable type of vehicle for service to meet the requirements of the present residents, as well as having regard to future developments of the district."

Municipal Haulage Contracts.—From time to time one hears expressed the suspicion that aspirants for municipal haulage work are not observing the established conditions of hours and wages for employees. Liverpool Corporation is taking steps to deal with such complaints as reach them, by appointing an investigator whose business it will be to see that the terms of the fair wage clause are being adhered to.

More Co-ordination. — The L.M.S. Railway Company has reached an agreement with the Ribble Motor Services, Ltd., as a result of which the railway company will be partners with the Ribble in the conduct of their road services. It is a condition of the agreement that unless the railway company acquire a number of ordinary shares sufficient to give the railway company a holding equal to the largest other individual ordinary shareholder, the agreement is to be cancelled.

Up-to-date.—The Watch Committee of the Bournemouth Corporation is considering a letter from Mr. W. W. Graham, of the Hants. and Dorset Motor Services, Ltd., asking for permission to substitute six of the latest low double deck covered top buses and three ordinary new 35-seater single deck buses for those at present in use on the Lymington Service.

Motor Hire.—The Works Committee of the Portsmouth Corporation recommends the following tenders for motor hire:—Mr. G. Park, for the supply of 3-ton lorries with tipping bodies at £2 7s. 6d. per lorry per day; Mr. E. Byng, for lorries without tipping bodies at £2 5s. 3d. each per day; and Mr. T. Cobb, for 30-cwt. lorries at £1 8s. each per day.

Digitized by Google

Manchester Notes.

FROM OUR OWN CORRESPONDENT.

Drivers' Hours.—Motor drivers' hours have always been the subject of much anxious thought in South West Lancashire transport circles, and whilst there is a big body of orthodox opinion on the matter, organised haulage firms and drivers have always had to contend against freelance operators, sometimes owner-drivers, who decline to be bound by agreements. The clause in the Government's proposed motor legislation is likely to make a big contribution towards uniformity. At present there is a 48 hour week for Manchester drivers, and all work after 54 hours is paid for as overtime. What tends more than anything else to prolong the working day is not driving time but the time spent waiting to be loaded at warehouses, etc.

Committee of Road Users.—One of the most representative transport organisations in the provinces is the Manchester Committee of Road Users of which Lieut.-Col. Sir J. Nall is president, Mr. R. C. Reynolds, O.B.E., chairman, and Mr. H. Howard Robinson, A.M.Inst.T., hon. secretary. During the last few months traffic problems, which have been very much in the ascendant, have been engaging attention and have been the subject of frequent consultations between the Committee, as representatives of the road users, and the City Corporation. The two latest adherents to the Manchester Committee of Road Users are the Manchester and District Conference of Railway Companies and the Royal Automobile Club. The other constituents are:—Amalgamated Horse and Motor Owners' Association, C.M.U.A., Conference of Manchester Carriers, Manchester Transport (Owners') Association, National Traction Engine Owners' Association, Manchester Owner Drivers' Association, the Automobile Association, and the United Road Transport Workers' Association of England.

Bus Service Sold.—The arrangements recently made by Mr. J. R. Tognarelli for the sale of his Manchester bus service to the joint undertakers—the Bolton, Salford, Manchester and Oldham Corporations and the Lancashire United Transport Co., has become effective. The only changes so far as the public are concerned are that the through service to Manchester which Mr. Tognarelli formerly operated is abandoned and the whole of the buses stop at fixed places en route. Though the number of buses per hour is not increased, they are evened out so as to give regular services at intervals of 12 minutes in the morning and 10 minutes in the afternoon. Each of the five authorities has contributed to the purchase price in proportion to the mileage operated by the Tognarelli service in their respective districts, and the fleet of 22 buses has been divided amongst them as follows:—Manchester Corporation, six; Salford Corporation, six; Lancashire United Transport Co, six; Bolton Corporation, two; and Oldham Corporation, two.

Transport in Cotton Industry.—Mr. A. A. Townend, M.P., in an address to the Manchester Athenaeum Textile Society, dealt with the problems of transport in the cotton industry. He said there was no reason why amalgamation in relation to bulk purchase should not be carried forward to the next stage—amalgamation of the firms in the different districts for the purpose of transporting the material by rail in bulk instead of in separate consignments. In every area where there were a good number of mills a bureau could be established to arrange for the transport of material in bulk. It would be an easy matter to allocate the charges to the different firms. The firms in the trade might also consider the question of a contract for the carrying of their goods. The railway companies might agree to a lump sum for a year's transport.

New Type of Traffic Signal.—Manchester Watch Committee is experimenting with a new type of three-way automatic traffic signal. A set of four signals has been erected at the crossing corners of Market Street, Corporation Street and Cross Street. Each signal lamp has three light faces.

To Retire.—Mr. H. Mozley, the general manager of the Tramways and Omnibus Committee of the Burnley Corporation, is to retire on superannuation on March 31st next after 29 years service with the Corporation. Arrangements are being made to appoint a successor.

Protection for Traffic Constables.—With the object of providing extra protection to constables who direct traffic at dark corners, the Chief Constable of Salford is having experiments made with a new type of belt, which is studded with red reflectors similar to those used at the rear of bicycles. If the belt comes up to expectations, it will in time form part of the equipment of all the men doing point duty.

Yorkshire Notes.

FROM OUR OWN CORRESPONDENT.

Railway Inquiries.—The activities of the railway companies in investigating the possibilities of making arrangements with some of the Corporations having passenger transport services have not been dropped, although recently there have been no announcements to make concerning acquisitions or the making of agreements in the West Yorkshire area. The Corporations which have been approached recently do not appear to be so ready to make arrangements as some of the earlier ones were.

Dangerous Roads.—Work on the roads has recently been fraught with considerable personal danger, in view of the frost. Weather conditions have been of the worst, and although certain climatic conditions can be forecasted the difficulty has been that there has been no means of knowing what would be experienced during a short journey. Fog and floods cannot be countered, and these have been experienced at their worst in the level portions of the county in the York and Selby districts. More treacherous than either, however, has been the frequent recurrence of frost which has made the roads impassable, but impassable only in short stretches, so that drivers have been unable to avoid skidding. A few weeks ago in a certain district of Bradford collisions were innumerable, while a few days later a similar state of affairs was recorded on one stretch of road in Wharfedale.

Rapid Loading.—A new system of loading road stone is being tried by the London, Midland and Scottish Railway Company at Keighley, where a large amount of limestone is being dealt with in connection with the construction of a new sewage works. The railway company is using wagons with four hoppers such as are used for coaling ships at Heysham and Fleetwood. The containers are lifted by a travelling steam crane, which is kept in readiness, and the stone is dumped direct into motor lorries without man handling. In this way considerable saving in time is being effected, and the economy over hand lifting is clearly apparent.

Farriers in Competition.—Speaking to the competitors at the Yorkshire Cart Horse Shoeing Championship at Leeds, Mr. T. W. Clayton, who won the gold medal at the Royal Show in 1911, urged that the weight of shoes should be reduced, and that this would lead to a longer and more comfortable life for the horse. Regarding complaints of bad road surfaces Mr. Clayton said if suitable shoes were properly adjusted, allowing the horse's frog to touch the ground, slipping and lameness would be prevented. The results of the various competitions were as follows:—Open Championship—J. Broadhead, Elland; 2, J. Rowlinson, Halifax; 3, W. Milner, Elland; 4, E. T. Snowden, Hebden Bridge. Open Journeymen's Class—J. Rowlinson; 2, W. Milner; 3, H. Masters, Halifax. Novice Class—H. Masters; 2, H. Scarborough, Haworth: 3, H. Drabble, Holmfield. Junior Class—C. Firth, Dewsbury; 2, H. Drabble; 3, J. Collins, Otley.

Extensions at York.—The York Tramways Committee is faced with the enlargement of its fleet of omnibuses very shortly, and having no garage accommodation it is proposed to erect a new garage for omnibuses at the central tram sheds at Fulford. Accommodation is to be provided at a cost of £9,000 for the structure, and £1,000 for pumps and apparatus.

New Railless Services. — Bradford is faced with the prospect of a very big conversion of its tramway routes to either railless or motor bus services in a comparatively short space of time, and in view of this fact the conversion of the Allerton route to railless is being closely watched. Already the Greengates route has been converted to motor bus operation, and probably there will be room for comparison here which will result on a decision being made on a point of somewhat far reaching importance.

Limitation of Traffic.—Congestion of traffic is a matter which is receiving a good deal of attention in the West Riding just now, and this appears to be the principal ground for objecting to licences for new motor omnibus services, though why motor omnibus services should be the only services to be limited is a question which cannot be satisfactorily settled. At Otley, for instance, the local Council has been perturbed at the number of vehicles passing through a "bottle neck" in the centre of the town, and discussed the matter in regard to the granting of further licences when application was made by the Hedna Bus Company to extend their service from Bradford to Yeadon to Otley. The Council has delegated its powers to the local Motor Omnibus Licensing Committee, which includes a number of local authorities, and the Committee has granted the licences.

Hull Notes.

FROM OUR OWN CORRESPONDENT.

Bus Drivers' Hours.—This subject continues to engage the active attention of the Hull and District Joint Advisory Committee. Representatives of the bus companies waited upon the Committee and were informed that they adhered to their previous decision that the companies should accept a condition that the working week of a driver of an omnibus should not exceed 60 hours. In reply they pointed out that Section 18 of the Road Traffic Bill, now before Parliament, provides that a driver shall not be on duty for any continuous period of more than five hours, or, for more than ten hours in the aggregate per day, and suggested that the Committee should defer discussion on the matter. To this the Committee agreed, but they decided to have a further meeting on the subject if the Road Traffic Bill does not become law this session.

Railway Licences. — The London and North Eastern Railway Company have written to the Hull and District Licensing Advisory Committee stating that they have been negotiating with several large omnibus companies with the object of co-ordinating services on the roads and that this had prevented them operating the licences to run bus services between Hull and Doncaster and Hull and Leeds. They asked for the renewal of the licences for the current year. The Committee's officer, Sergeant Basford, pointed out that the licences had never been taken up by the company, and the Committee decided to inform the company that they must apply for their renewal when they are in a position to operate the services.

Too Little Time.—Swanland Parish Council have complained that the time allowed for the Hull, Swanland and Ferriby bus service is too small and necessitates excessive and dangerous speeds in order that the drivers may comply with the time-table. The matter is receiving the attention of the Licensing Committee.

Tramway Men's Good Fairy.—This is the light in which the Hull tramway volunteers regard Lady Houston. Her interposition in their case focussed the attention of the entire country on it in a manner nothing else could have done, and made its discussion in Parliament inevitable. Her generosity has provided each of the 115 men threatened with dismissal by the Socialist majority of the City Council with a New Year's gift of £8 7s. 6d., and, in addition, has assured them of the necessary funds wherewith to test the legality of the Council's action. The case has already been before a Judge of the High Court and on the Corporation agreeing not to carry the resolution into effect in the meantime the application for an injunction stands adjourned until January 17th. There is every probability of it developing into one of the most important of its kind ever decided.

Haulage Problem.—An interesting visitor to the Hull Chemical and Engineering Society was Mr. Norman E. Box, the well-known Manchester haulage contractor, who addressed them on the subject of heavy haulage. He declared that few of the public were aware what enormous loads were carried by road nowadays and explained that that was due to many of them being moved at night or in the early morning when few people were about. It was not the weight of the load which presented the difficulty, so much as the shape, and in this connection he related that on one occasion all the lamp-posts between Stocksbridge and Manchester, a distance of about sixteen miles, had to be removed to permit the passage of a ship's rudder, 24 feet wide. Another interesting occurrence mentioned by him took place at the railway bridge at Wetherby. Measurement showed a clearance of a few inches, but just as the motor vehicle was going under the bridge a train passed overhead and was sufficient to depress it and to jam the load.

Road Tars. — After visiting the Hull works of the British Gas Light Coy., Ltd., the members of the East Riding Surveyors' Association discussed road tars and their application. Mr. Harold E. Copp, the gas company's engineer and manager, commented on what he described as the small amount of tar at present used on roads. His company wanted to know surveyors' requirements in that direction in order that they could meet them. He was inclined to the opinion that mixtures of British made tars and imported bitumen would solve their difficulties. Mr. F. W. Bricknell, formerly Hull City Engineer, declared that there were scores of miles of roads in Yorkshire which were a disgrace to any official. If such roads were given a coat of tar when in the right condition the ratepayers would be saved a tremendous amount of money. "Use more tar for your own good and that of the ratepayers," was his advice.

South Wales Notes.

FROM OUR OWN CORRESPONDENT.

Carmarthenshire Firm's Enterprise.—The West Wales Motors, Ltd., Ammanford, have commenced a daily service of buses from Ammanford and Llandebie to Swansea via Pontardulais. This service has long been projected but was held up by local authorities refusals of sanction.

Conviction Quashed.—With regard to the report in our Law Cases columns in the December issue that Mr. E. Snow, Merthyr Tydfil, had obtained from the Divisional Court an order calling on the Neath Justices to show cause why a conviction by them of Mr. Snow for alleged overcrowding of a bus should not be quashed, the High Court, has, subsequently, quashed the conviction on Mr. Snow's application, the Justices making no appearance. The case involved an interesting point of law on licensing (Road Fund) issue and use.

For Through Traffic.—The Cardiff City Council is to spend £460,000, all but £69,000 being derived from grants, in making an orbital road for through South Wales traffic use to avoid the need of such traffic passing through city centre. The road will switch from the main South Wales road at Rumney Bridge, at the entrance to Cardiff on the Newport Road, northward and westward to make a flattened arc round the city on the north side and rejoining the main road at Ely Bridge, on the other side of the city, on the Cowbridge Road end of the South Wales main road.

Co-ordinating Long Distance Services Licensing.—The South Wales local authorities are conferring on a co-ordinated and uniform policy of licences issue for long distance services from South Wales.

A Ministry Ruling. — The Ministry of Transport has given its ruling in the matter of the appeal made by Imperial Motors, Abercynon (proprietor, Mr. W. J. Davies), against the suspension of their licences and services on the route Cardiff—Pontypridd—Aberdare. The Cardiff Council alleged that there had been breach of running conditions by the service, including the running of buses additional to those licensed, and on this ground suspended the four bus services of the firm on this route. In making appeal to the Ministry the Company asked that six licences be issued for the route. The Ministry decision is that the stopping of the service was too harsh a penalty for the alleged offences, even supposing them to have been committed. It advises the Council to issue six licences to the firm and remarks that it is of opinion that local authorities should always issue extra licences to those normally required to permit bus proprietors to run extra services when by special occasions they are required.

Local Men for Local Services.—Some of the area local authorities have resolved to insist as a condition of licence issue that local men be employed on locally licensed services. Where the services licensed are through area services these authorities propose to insist that their area quota of employees be taken by the licensed companies. This does not mean that present employment will be disturbed but that as vacancies arise local demands will have to be met. The proposal may cause trouble to proprietors.

Haulage.—Whilst keenness of competition is said to make haulage trade improvement slow, if steady, there has been one direction in which outlet has been found for West Wales haulage contractors willing to make long distance journeys. The tin-plate carrying, one is assured, to London and England centres generally, from South-West Wales, is greatly increasing as far as road distribution of plates is concerned. As recent companies reports indicate increased works activities, following improved demand; during the New Year the prospects of haulage in this connection are good.

Merthyr Progress.—The Merthyr Corporation is to buy four new buses for addition to its municipal fleet. Increasingly encouraging financial reports have been presented in recent months to the Bus Committee. The joint municipal service with the Cardiff Corporation between Merthyr and Cardiff will be commenced much earlier than was thought possible.

For Reconsideration.—The Merthyr Watch Committee has now agreed to reconsider its refusal of licences for the route Merthyr—Cardiff to Messrs. W. J. Davies and Son, Merthyr, and the firm's legal representatives are to submit the company's claims to be licensed. Reconsideration is promised, too, of the application of Messrs. Jones Bros., Treharris, who wish to run six buses between Merthyr and Treharris. Further refusal of licences has, however, been made to Messrs C. Davies & Son, Dowlais; Gerald King, Pontypridd; Imperial Motor Coy., Abercynon and King's Garage Coy., Mountain Ash.

North-East Coast Notes.

FROM OUR OWN CORRESPONDENT.

New County Surveyor.—Mr. Alexander Cheyne, Deputy County Surveyor of Durham, was, on December 27th, elected unanimously as County Surveyor of Northumberland. Mr. Cheyne has been in the service of Durham County Council 16 years, five of which as Deputy Surveyor. He will take up his new duties at the end of March. He has been Assistant County Surveyor of Breconshire and Salop County Councils; and is an Associate Member of the Institution of Civil Engineers and of the County Surveyors' Society; a Fellow of the Surveyors' Institution, and a member of the Institution of Municipal and County Engineers. During the war Mr. Cheyne supervised the construction and maintenance of roads in France and elsewhere; and in November, 1923, he was put in charge of the department engaged in preparing plans and contracts for the most extensive programme of bridge construction ever undertaken by Durham County Council.

Expert Opinion.—Mr. John Petrie, general manager of the Northern General Transport Co., Ltd., interviewed as to the new Transport Bill, said that the speed of motor buses had been increasing too much of late years, and it was about time that legislation was passed on the matter. A limit of 30 miles an hour was perhaps a little low; 35 miles was much better as a maximum; but it was very wise to "cut" the hours of duty. On the long distance journeys, from what he heard, drivers had no sleep at all, and that was obviously a danger to travellers. An official of United Automobile Services, Ltd., pointed out to the writer that they already comply with the proposed restrictions, having no schedules over 30 miles an hour.

Traffic Bill and Removals.—Mr. A. E. Millard, President of the Furniture Warehousemen and Removers' Association, who is a director of Messrs. Robson & Sons, Ltd., Newcastle, spoke to the point at a recent meeting of the local Chamber of Commerce's Railway Committee Mr. Millard said that his Association's chief criticism of the new Road Traffic Bill was against Section 18, which, as it stood, would, they considered, be very detrimental to the interests of their industry and inflict great hardships on clients by inconveniencing them as well as by increasing costs quite unnecessarily. The Section limits the time for which drivers of certain vehicles may remain continuously on duty; but Mr. Millard asked what precisely it meant. He was afraid, he added, that the Bill, if it became law in its present form, would divert a lot more traffic to the railways. It was certainly full of anomalies and complications, and needed expert interpretation. The Secretary of the Chamber, Mr. Herbert Shaw, said that, as a magistrate, he had come to the conclusion that no one could estimate speed accurately. It was agreed that he should refer all the points raised to the London headquarters of Chambers of Commerce.

South Shields Buses.—The Ministry of Transport's decision regarding the running of privately-owned buses at South Shields, the outcome of an inquiry held in July, does not support the licensing authority in imposing certain conditions to the licences of the Northern General Transport Co. and other bus concerns running in and out of the borough. One of these is of especial interest. It had been set forth that the licensees should pay trade union rates of wages to drivers and conductors; but the decision states—"The Minister considers it to be undesirable that, in connection with the granting of licences, a licensing authority should become a wage-fixing authority, and so supersede the usual negotiating machinery for settling conditions of service."

Faster Trams.—The new manager of Sunderland Corporation trams, Mr. Charles A. Hopkins, is a great believer in speeding up the system. About 50 per cent. of the track, he says, needs renewal, at a cost of £75,000; while he would like to replace the present fleet of cars by new ones which will be much faster. An experimental car is said by the Press to "run more like a high-powered motor car"; and, comments Mr. Hopkins, "all this talk of 'scrap the trams' is nonsense!"

Question of Colour.—The 15 new Leyland buses acquired by United Automobile Services, Ltd., for North-East area routes are painted dark green, instead of yellow like the old fleet; while Newcastle Corporation Transport Committee has definitely adopted royal blue for its new buses in place of the previous light blue, which it has been found is too costly to maintain.

Road-Rail Tickets.—Since the L.N.E.R. acquired a controlling interest in many motor bus companies in the North-East area, travel tickets available either by rail or road are gradually being introduced.

Midland Notes.

FROM OUR OWN CORRESPONDENT.

British Industries Fair.—Prospects for the success of the Heavy Section of the British Industries Fair, which opens in Birmingham on February 17th, are good and only a few stands, all of comparatively small dimensions, are now available to last minute exhibitors. Some of the late comers have been disappointed in not being able to secure the space they desire. Transport interests are strongly represented.

Birmingham's Big Traffic Difficulties.—As the years pass the difficulties of traffic congestion in Birmingham become more pronounced. Two proposals are now in hand: (1) Abolition of the trams in favour of an underground system, (2) a one-way road system providing two lines for traffic—slow and quick moving. There is no doubt that the one-way traffic idea would be put into practice but for opposition from shopkeepers, who believe their trade will be interfered with by any restrictions on traffic. As to the tube proposal, opinions are more varied. Generally it is regarded as too expensive and not a sure cure. One set of opinion favours the electrification of the local railways and the construction of overhead tracks—and there is very little doubt that this would prove a great boon. Anyway, the problem is a big one, and the remedy, to give satisfaction, must be big too. Many people think that the whole problem can be solved by developing existing transport means rather than by the construction of a tube.

Developments at Walsall.—Walsall Town Council has decided to promote a Bill to acquire powers for extending the borough, acquiring trams and, if necessary, substituting buses in Wednesbury and Darlaston, making new roads, a central bus station and generally opening up the centre of the town.

Crowding.—The Hanley and other Potteries authorities are making a stand against the overcrowding of buses.

Busy Crewe.—Since the policy of reorganisation, which started two years ago, Crewe has been very busy. The output during the past year was the heaviest of any single year. Recently the building of the hundredth new type locomotive in nine months has been completed.

Rights of Coaches on the Road.—The point arose at a Wolverhampton Police Court hearing at the end of December as to whether a Corporation, which runs a transport service along a defined route, can act judicially in deciding to refuse a licence to a private transport company desiring to operate vehicles on the same route. Three summonses were heard against Tours and Transport, Ltd., King Street, Wolverhampton, for plying for hire without a hackney carriage licence. Mr. T. P. Haslam, for the Transport Company, said there was a dispute between the Corporation and the Company and the Ministry of Transport had been communicated with. The point was whether the Borough Council had acted judicially in deciding not to grant the necessary licence to run the service. Since the question was before the Ministry, he suggested the summonses should be suspended, pending a decision. Mr. Haslam also urged that a private company need not apply for a licence if their vehicles were suitable and had been passed as hackney carriages. "The Corporation," said Mr. Haslam, "are desirous of getting a monopoly." Was it right that a private company should be subjugated for that reason? The Corporation had acted arbitrarily and not judicially in refusing to grant the licence. Mr. E. E. King (Deputy Town Clerk) said it would be wrong to go into the merits of the dispute since it was the subject of a judicial inquiry by the Ministry of Transport. There was an appeal pending against the refusal of the renewal of the licence. Evidence showed that on December 10th and 11th the Company ran a motor coach service from Railway Street, Wolverhampton, to Bridgnorth, a route over which Wolverhampton Corporation ran a service. The facts showed that there had been a deliberate breach of the law. Until the Watch Committee's decision had been upset, he submitted, it was final and effective, and suggested that the proper course was for the company to have refrained until there had been an inquiry. The company was fined 10/- in one case and 25/- costs and ordered to pay 25/- costs in the other two. The Stipendiary (Mr. Bertram Grimley) said when an Act of Parliament said persons must apply to the Corporation for a licence and the application was refused, persons who continued could not exonerate themselves by saying they were appealing to the Ministry of Transport. If a licence was refused the proper course was to wait until the Ministry had given a decision. He had no power, so far as he knew, to suspend his decision until that of the Ministry had been given.

Scottish Notes.

FROM OUR OWN CORRESPONDENT.

Tramway Manager's Message.—The annual message to his staff by Mr. Lachlan Mackinnon, the General Manager of the Glasgow Corporation transport services, is always interesting. This year he says there is ahead a continual challenge to better service. "The new and re-conditioned cars are without doubt bringing increased patronage and are meeting with approval, but this alone will not retain our patrons and attract new customers. There must be a continual striving to make the best better. . . . Statistics show the tramcar is still the safest of all vehicles." Referring to accidents Mr. Mackinnon states: "Faster service is demanded but we cannot afford to sacrifice safety for speed. Passengers should always have time to board and alight in perfect safety. Conductors should warn alighting passengers to be careful and boarding passengers to hold tight."

Rolling Stock.—The rolling stock of the Glasgow Corporation at the end of the year consisted of 54 double bogie cars; 323 reconstructed cars; the upper saloons of 105 cars have been completely enclosed; bow collectors are now fitted to 78 cars; magnetic sand gear is fitted to high speed cars in addition to the air operated sand gear; rheostats which were formerly subjected to over heating have been altered and baffle plates fitted to divert hot air to the back of the platform. There are now 123 double-deck buses and 16 single-deck buses in the service, and the delivery of 100 additional buses has begun so that within a month or two there will be running about 230 buses which is exclusive of the old type still in service.

Rail and Road Services.—No agreement has yet been reached between the railway companies and the Glasgow Corporation Transport Committee on the question of co-ordinating services. The Corporation propose that the municipal services should have a monopoly for buses and trams within the area now served by the tram services—from Kilbarchan to Airdrie. The railway companies offered a monopoly within the city conditional on the Corporation agreeing to 50 per cent. ownership of bus services in the outside area and a complete monopoly for the railway companies of traffic beyond that area. The Transport Committee declined this proposal.

Opening out Rothesay.—Plans for a class 1 18 foot highway round the Island of Bute have been approved by the Ministry of Transport. At the present time there are no county highways north of Port Bannatyne and Ettrick Bay. There are private roads near Kilmichael but they are not suitable for tourist traffic. The new road will also make motor ferry communications between Bute and the mainland possible. When completed the plans will open up some of the finest scenery in Scotland and make Rothesay more popular.

Ship Canal.—It is likely that the Inter-Departmental Committee, appointed to consider the question of the Mid-Scotland Ship Canal, will hold its first meeting soon. The conclusions reached will be submitted to the Government. There has not been any great interest taken in the subject although several county bodies are urging forward the matter, but many practical difficulties lie in front of all proposed schemes. The cost of building a canal to-day would be very high for one thing.

New Bus Route.—A new bus service between Glasgow, Greenock and Gourock has been started, the route being by way of Govan, Renfrew, Inchinnan, Bishopton, Langbank, and Port Glasgow. The L.M. & S. Railway Co., in conjunction with the Greenock Motor Services, are undertaking the service, the vehicles used being 32 seaters, Albion chassis.

Noisy Motor Lorry.—The first prosecution of its kind was heard in the Glasgow Sheriff Court when an owner was charged with permitting his motor lorry to be used when it was causing excessive noises. There was faulty adjustment, too much play in the front wheel bearings, steering pins and rods, a broken rear spring, loose driver's cabin, and loose engine. A fine of £1 was imposed. The case had been brought as a warning to owners to make sure that their vehicles were in a proper state of repair when they were put on the street.

Reconstruction after Fire.—Messrs. Wordie & Co., the well-known Glasgow carriers, have been granted permission to reconstruct their offices, joiners' shop, and stores in their Dumbarton Road branch which were burned out some months ago.

Disastrous Dundee Fire.—Fourteen motor coaches and a motor car were destroyed by a fire in the premises of Messrs. Thomas Russell & Sons, Douglas Foundry, Graham Street, Dundee. Stores containing a large quantity of petrol and oil were fortunately not involved.

Northern Ireland Notes.

FROM OUR OWN CORRESPONDENT.

Double Deck Omnibuses in Northern Ireland.—The Northern Ireland Ministry of Home Affairs have at last agreed to licence double deck omnibuses, and the Belfast Corporation will invite tenders for six of these vehicles at an early date. For a long time the Home Department held out against the "double-deckers," and their change of mind follows some very earnest persuasion on the part of those responsible for Ulster road passenger transport. Mr. W. Chamberlain, the general manager of the Belfast Corporation Tramways, took a leading part in convincing the Ministry of Home Affairs, and no doubt even half a dozen double-deckers will assist him in his efforts to place the Belfast undertaking on a sound basis. Mr. Chamberlain came about a couple of years ago from Leeds, where he was general manager, and in this comparatively short time he has instilled an atmosphere of life and vigour into the department he controls.

New Tramcars for Belfast.—Fifty new tramcars are also to be bought by the Belfast Tramways Committee, in addition to the six double deck buses, so the cry of "scrap the trams," which arose here as elsewhere, is not to be carried into effect. Mr. Chamberlain coined a phrase, I think, when he described the trams as a "not out of date service." It seems to fit the case exactly. In the Parliamentary Bill which the Corporation is now promoting, power is being sought to run vehicles of the trackless trolley type. There are no indications that the power, if secured, will be used, for the present at all events.

Port of Derry.—For the thirteenth time in the history of the city, the tonnage entering the port of Derry has exceeded the million mark. Last year's figure is 1,026,170 tons, a decrease of about 96,000 tons as compared with 1928. One hundred years ago the tonnage was made up of 48,912 home trade and 7,537 foreign trade. In 1929 home trade accounted for 306,470 tons, and foreign trade for 87,459 tons, the balance of 632,241 tons being represented by the trans-Atlantic steamers which put in at the Foyle. The million mark in the port returns was first reached in 1890.

Port of Belfast.—At the Port of Belfast the net register tonnage cleared up to the 14th December totalled 3,281,000 tons, an increase of 255,400 tons over 1928. During the past twelve months 470 vessels arrived at the harbour from foreign ports, their nationality being as follows:—British, 319; Dutch, 50; American, 47; German, 25; Norwegian, 13; Greek, 11; Danish, 9; Swedish, 6; Italian, 2; French, 1; Japanese, 1; Lithuanian, 1. Their cargoes were as follows:—General, 366; maize, wheat, etc., 47; timber, 25; cement, 12; phosphate, 7; oil, 6; pyrites, 5; machinery, 3; slates, ore, etc., 4; wood pulp, 1; dried fruit, 1; oilcake, 1; tar, 1. The consignees were:—R. & H. Hall, Ltd., 25; W. & R. Barnett, Ltd., grain merchants, 21; Richardson's Chemical Works, 10; W. J. Copeland & Co., timber merchants, 7; J. P. Corry & Co., timber merchants, 7; M'Cue, Dick & Co., timber merchants, 4; Geo. Rankin & Co., 3; French Cement Co., 3; Workman, Clark & Co., Ltd., shipbuilders, 3; Harland & Wolff, Ltd., shipbuilders, 2; Anglo-American Oil Co., 2; James A. Beck & Son, Ltd., wholesale chemists and oil merchants, 2; Ruddell, Harvey & Co., timber merchants, 2; Connolly, Shaw & Co., Ltd., 1; T. J. English, 1; Isaac Andrews & Son, flour millers, 1; T. Dixon & Sons, Ltd., timber merchants, 1; British Mexican Petroleum Co., Ltd., 1; J. M'Caughey & Co., Ltd., 1; Irwin & Sellers, Ltd., timber merchants, 1; Oilit Supply Co., 1; Belfast Gas Works, 1; and Shell-Mex Co., Ltd., 1. The Harbour Board announce that preparations are beginning for the construction of the new dock, which will add greatly to the harbour accommodation. Last month they received delivery of a 150-ton hammer-head crane, electrically driven. It will be used for the repair and fitting out of vessels, and will improve Belfast as a shipbuilding port. During the year they also installed three additional 5-ton electric cranes at the Albert Quay.

Railways and Road Transport.—A fleet of four new Leyland Tiger omnibuses has been acquired by the L.M.S. Railway Co. (Northern Counties Committee), and they will maintain a road passenger service between Belfast, Ballyclare and places en route. The buses are of the latest type, with six-cylinder engines and low pressure heating, and they were purchased from Messrs. Alister, Kirk & Co., Dunbar Street, Belfast.

Appointment.—Mr. J. Quirey, C.B.E., who has just been appointed vice-president of the Railway Traffic Board and Commercial Sections of the L.M.S., is a native of Monkstown, near Belfast.

Digitized by Google

Irish Free State Notes.

FROM OUR OWN CORRESPONDENT.

Control of Road Traffic in the Irish Free State. — In Dail Eireann, last month, General R. Mulcahy, Minister for Local Government, was granted leave to introduce the Road Traffic Bill, 1929. The purpose of the Bill is: "To amend and consolidate the law relating to the following matters, viz.—the classification and construction of mechanically propelled vehicles; the licensing of drivers of such vehicles; the speed at which such vehicles may be driven; the management of mechanically propelled vehicles in public places; the lighting of all classes of vehicles; the licensing and regulation of public service vehicles, and the drivers and conductors thereof; the control of traffic in cities and towns; to make provision for the insurance by owners of mechanically propelled vehicles against liabilities incurred in respect of the user of such vehicles; and for other matters incidental to the matters aforesaid." The Dail was adjourned until February 12th.

Omnibus Traffic in the Irish Free State.—Figures relating to omnibus traffic in the Irish Free State for the ten months, 1st January to 31st October last, are given in the returns issued recently by the Ministry for Industry and Commerce, from which it appears that the number of passengers carried by buses in the Irish Free State for the first ten months of the year 1929 was 39,721,000, as compared with 24,376,000 for the corresponding period in 1928; that the total vehicle miles traversed in the January—October, 1929, period was 19,166,000, as against 13,349,000 in the corresponding ten months of 1928; and that the gross receipts for the ten months of 1929 was £684,643, as compared with £506,732 for the first ten months of 1928. These returns show how bus traffic continues to increase on Free State roads, and how the country and people are served by such traffic.

Customs Inspection of Vehicles Crossing the Irish Border.—An order amending the regulations governing the inspection of vehicles and their loads on the border Customs stations has been issued. This new order sets forth that vehicles entering the Irish Free State from Northern Ireland shall proceed from the frontier to the Customs station, and on leaving the Free State for Northern Ireland shall proceed from the Customs station to the frontier station, and that all acts required by the Customs regulations shall be done at the Customs stations on such routes. A schedule of approved routes for entering or leaving the Free State across the border was given with the order for the information of those engaged in transport trading.

Export of Tractors from Cork.—During the past nine months Cork has become a great port for the export of tractors. From the Irish Free State Trade Returns, issued recently, it appeared that for the seven months from 1st April to 31st October last, tractors to the value of £1,234,253 were shipped from Cork to various Continental destinations, including Russia, which was supplied with considerable quantities of Cork-made tractors. The export of tractors from Cork is a constantly expanding trade. For instance, the value of tractors and parts shipped from Cork during the month of April last was £146,861, while for October last it had increased to £296,081 for that month.

Coat of Arms of Londonderry City to be used on Buses.—At a meeting of the Motor Omnibus Committee of the Londonderry Corporation a letter was read from Messrs. Catherwood, Ltd., bus owners, requesting permission to use the Londonderry Coat of Arms on the City service buses. The Committee approved of the suggestion and decided to grant the request, subject to conditions to be laid down by the Solicitor of the Corporation. The Coat of Arms on the buses will enhance the appearance of the vehicles, which have become popular in Londonderry.

Bus Traffic a Serious Problem in Dublin. — In the Dublin District Court, District Justice Cussen, arising out of a case brought against a bus driver, said that the bus traffic in Dublin was presenting a serious problem. There were now in Dublin some 400 buses, and about 16,000 private motor cars. During the past nine months the number of deaths in street accidents was remarkably large, and it was becoming more and more imperative that the signals and the orders of the Civic Guards should be strictly and promptly obeyed. He believed that the element of speed was of the utmost importance, and he felt that speed had been responsible for the holocaust of victims in their midst during the past nine months. The speed limit of 20 miles per hour must be observed, and in all cases where the Civic Guards proved that it had been exceeded, he would convict.

Annual Social Reunion of the Society of Irish Motor Traders, Ltd.—The Fourth Annual Dinner of the Society of Irish Motor Traders, Ltd., held in the Aberdeen Hall, of the Gresham Hotel, Dublin, on December 19th, was presided over by Mr. J. J. Reddy, President of the Society. Mr. Eamoun Duggan, T.D., Parliamentary Secretary to the Executive Council of the Irish Free State, responded to the toast of "Ireland," and in the course of his remarks said that he had come to the conclusion that in the very near future it would be necessary in Dublin to provide parking for motor cars either overground or underground. He suggested to them all that the very best service they could give to the State was to be optimistic. The Government had expended some millions of pounds on roads in the Irish Free State without imposing any great burden on the taxpayers. They wanted visitors to come to Ireland, and they had good grounds for boosting their own country. They had in Ireland as good roads as could be found anywhere in Europe. The Society of Irish Motor Traders had a special mission as far as bringing visitors was concerned. Mr. P. F. Quinlan, of Limerick, proposed the toast of "Our Guests," and said that the motor trade as such was not consulted as much by the Government as its importance warranted. The toast of the "Society of Irish Motor Traders, Ltd." was proposed by Mr. Bailey Young, President of the Scottish Motor Traders' Association.

Plea for Canals.

PROPOSALS for the economic development of canals in this country were placed before the Royal Commission on Transport, in the House of Lords last month, by Mr. George Cadbury, on behalf of the Federation of British Industries and the National Union for Inland Waterways.

Mr. Cadbury submitted a memorandum suggesting improvements in existing waterways with a view of adding to their efficiency. These included the following proposals:—

The amalgamation of all inland waterways into groups uncontrolled by other competing interests, on the lines of the recommendations contained in the Second Report of the Committee on Inland Waterways (1921) under Mr. Neville Chamberlain.

The relief from stamp duty which was given to the Railway Companies under the Grouping Act, 1921, should be extended to Canal Companies carrying out amalgamations under the recommendations of the Committee on Inland Waterways.

Canal Companies should be given wider powers to raise capital and should be put on the same footing as railways in this respect.

State Unemployment Relief Schemes should include the improvement of certain canals, so as to increase the capacity of the waterways with resultant decrease in working costs.

The encouragement of mechanical propulsion for craft using the waterways, and adequate terminal facilities at traffic centres.

Opinion was expressed that the Ministry of Transport should set up a department especially responsible for all questions relating to canals and inland waterways.

Mr. Cadbury mentioned the Grand Union Canal Company as an example of successful amalgamation, pointing out that among the advantages which had accrued were that a through route between London and Birmingham was now available, the question of tolls was in the hands of one authority and any weak points in the organisation could be easily dealt with. But before general amalgamation could be effected he believed Government action would be necessary, as there was no sign that the railway companies owning canals were willing to adopt the principle of amalgamation.

Law Cases.

CLEARER REGULATIONS NEEDED.

It was suggested in a prosecution at Birkenhead police court recently, that the Mersey Docks and Harbour Board should make their regulations governing the use of the floating roadways less liable to misunderstanding. The case was one in which a motor haulage contractor was summoned. It was stated that the maximum weight for a six-wheeled vehicle using the floating roadway at Woodside, was fifteen tons, but that defendant's wagon, with its load of grain, loaded on it at one of the flour mills at Birkenhead docks, exceeded this.

Mr. Winn Edwards, solicitor of Oswestry, contended that, according to the regulations issued by the Dock Board, defendant's vehicle could carry up to six tons for each of the three axles, as the axles were more than ten feet apart.

Mr. H. Denton, for the Dock Board, drew attention to the notice in which it stated "Six-wheeled vehicles . . . 15 tons."

Defendant was fined 10s. but costs were disallowed.

ALLEGED AIDING AND ABETTING. APPEAL SUCCEEDS.

IN a King's Bench Divisional Court, composed of the Lord Chief Justice and Justices Avory and Talbot, on December 2nd, Mr. Ernest Edward Snow, omnibus proprietor, of Lower High Street, Merthyr Tydfil, appealed with success against a conviction by the Neath Justices and a fine of £5 imposed on him for "aiding and abetting" one of his bus conductors to carry in his vehicle more passengers than the vehicle was licensed to hold.

The case came before the court on a rule obtained by Mr. Snow that called on the Neath justices to shew cause why the conviction should not be quashed.

Mr. T. R. C. Goff (for Mr. Snow), said the justices had not appeared, although they had sworn an affidavit. It transpired that one of Mr. Snow's bus conductors was summoned for being in charge of a vehicle that was licensed to carry 14 passengers, and which was, in fact, carrying 11 adults and 5 children. Mr. Snow was charged with "aiding and abetting" his employee in the offence, and was fined. The summons was issued on June 3rd, last; two months after the alleged offence, which was said to be against Section II of the Roads Act, 1920, that dealt with penalties for evading Excise licence duties. It would appear that the Minister of Transport had stated that two children could be counted as one adult for the purpose of computing the carrying capacity of a licensed vehicle, and Mr. Snow wrote to the Minister about that matter. He had received no answer when the summons was due to be heard, so he arranged, through the Chief Constable of Merthyr Tydfil, that the case should be adjourned. That adjournment was agreed to by Neath justices, and Mr. Snow heard no more about the matter until he read in the newspapers that the summons had been tried in his absence and he had been fined £5. His first point now was that the justices had no jurisdiction to so adjourn the case and then deal with it in his absence.

The justices had sworn an affidavit in which they denied lack of jurisdiction. They stated that, when they agreed to the adjournment of the case, they fixed the hearing for a date three weeks ahead. They said that Mr. Snow could not be heard to complain that he did not receive written notice of the date of the actual hearing, when the justices, receiving a telephoned request for adjournment, gave a telephoned answer that notified the date to which the case was adjourned.

Mr. Goff said it might appear that the case of Mr. Snow now was an ungrateful one, but, as the justices had not notified him about the adjourned hearing, he was in just as bad a condition as he would have been had the case not been adjourned at all. He had no answer from the Minister of Transport until nearly the end of June.

Mr. Goff added that when the summons was read, after conviction, it was found that the justices had not stated under what statute the proceedings had been taken. When asked under what section and Act they imposed the fine, they said. "Section 13 of the Finance Act, 1920." As a matter of fact, that section disclosed no such penalty or offence, and his contention was, therefore, that the justices had proceeded under the wrong statute and the conviction could not stand.

The court allowed the appeal, the Lord Chief Justice observing that it was tolerably clear that the justices decision could not stand, because they had stated that the penalty or fine was imposed under Section 13 of the Finance Act, whereas that section did not disclose any such penalty or offence. With regard to Counsel's first point, there was much to be said, but it was not, in the circumstances, necessary to say it. The conviction would, therefore, be quashed and the justice's order set aside.

OVERCROWDING A TROLLEY CAR.

KINGS Bench Divisional Court: The Lord Chief Justice and Justices Avory and Swift.

Mr. George Bell, Superintendent of Police for Bradford (Yorks.), appealed against a decision of the East Morley (Bradford) Justices, who had declined to convict Frank Jagger, a conductor of one of the Bradford Corporation trolley tram cars, for an offence against Section 14 of the Railway Passenger Duty Act, 1842, viz., allowing a stage carriage that was constructed to hold 36 passengers to be overcrowded and to carry 59 adults and one infant.

Mr. Morley, who appeared for the appellant, said the whole point was whether the defendant was protected by a Private Act of the Corporation of Bradford and whether that private act prevented the court from calling the vehicle a stage carriage so as to bring it inside the Act of 1842.

The summons was brought under the Railway Passengers Duty Act 1842, which prohibited the overcrowding of stage carriages plying for hire. This particular trolley car was run regularly on a route between Bradford and Clayton, and there is no doubt that it was overcrowded. Counsel added that the Act of 1842 was embraced by the Light Locomotives on Highways Act, 1896, and such things as trolley cars come within the category of stage carriages. There was, however, a section of the Bradford Corporation Act, 1910, which purported to lay it down that no vehicle used on the tramway system in Bradford should be deemed to be a light locomotive within the meaning of the Act of 1869. The justices held that the trolley car was overcrowded, and was plying for hire over a fixed route, but, having regard to the provisions of the section of the Bradford Corporation Act, 1910 it was not a stage carriage as meant by the Act of 1842. But, the justices also said, were it not for the local Act of 1910, they would have held that an offence had been committed in consequence of the provision of the Light Locomotives on Highways Act, 1896.

The Lord Chief Justice remarked that it was extraordinary that a local Act should defeat the provisions of a general Act passed for the protection of the public.

Mr. Morley replied that it was, and he suggested that the Court would strive to see that such a local Act should not have any effect that would so deprive the public of the protection that Parliament intended should be extended.

The Lord Chief Justice pointed out that the Light Locomotives on Highways Act said that any light locomotive on the highway should be deemed to be a carriage.

Mr. R. M. Montgomery, K.C. (for the respondent), explained that, although there seemed no legislative enactment to prevent overcrowding of tramcars in Bradford, the matter was governed by by-laws adopted from those prepared by the Board of Trade.

The Lord Chief Justice: If a person who owns a motor bus in Bradford overcrowded, he can be prosecuted for running a stage carriage holding too many passengers, but the municipal authorities seemed to be able to overcrowd their trolley cars as much as they liked.

Mr. Montgomery: Yes, to the limit of the by-laws.

The Court allowed the appeal with costs, and added that the case should go back to the justices with the expression of opinion that the defendant should be dealt with for an offence against the Act of 1842.

The Lord Chief Justice said that the justices were satisfied that the vehicle was overcrowded: it contained, in fact, nearly twice the maximum number of passengers that the law allowed. They also found that the vehicle was plying for hire upon a regular route by stages. Finally they said that but for the provision of the Bradford Corporation Act, 1910, they would have convicted respondent of an offence under the Act of 1842.

The real question was narrowed down to this: was it true to say that by reason of Section 14 of the Bradford Corporation Act, the respondent must be held not to have committed the offence? The point of the matter for the purposes of the present case seemed that it was said before the justices that the vehicle could not be regarded as a stage carriage unless it came within that category by reason of the Light Locomotives on Highways Act, 1869, and, inasmuch as the local Act provided that such a vehicle was not to be deemed a light locomotive, it followed that there was no reason whereby the vehicle could be truly represented as a stage carriage. "Now in my opinion," went on his Lordship, "that is an extremely fallacious argument: it is exemplified by the commonest of all the fallacies which could be illustrated by the

Digitized by Google

following example. It might be said that some men with red hair travelled from London to Liverpool, also, no men without red hair every travelled from London to Liverpool. No doubt, if those vehicles were light locomotives within the meaning of the Act of 1869, it would be perfectly obvious that they were stage carriages. It seems to me to be a perfectly complete *non sequita* to say that they cannot be stage carriages on any other grounds if they failed to come within the category. It seems to me, therefore, that the argument presented to the justices cannot succeed, and the appeal must be allowed with costs, and the case will go back to the justices with the expression of opinion that an offence has been committed."

Justices Avory and Swift concurred.

ALLEGED UNLAWFUL PLYING FOR HIRE.

BEFORE the Swansea Stipendiary Magistrate, Sir E. Marley Samson, K.C., legal points bearing on the prosecution of bus proprietors for alleged unlawful plying for hire were discussed and decided upon.

Defendants were Mr. V. E. Jones, Mr. Thomas Roderick, Mr. John Homes and Mr. Stanley Parkyn, all bus proprietors of the Swansea District, who were summoned for alleged plying for hire without the assent of the Swansea Corporation. Mr. W. E. Gough, bus proprietor, Mountain Ash, and the A. T. Morse Automobile Coy., Cardiff, were also similarly summoned.

Mr. Walter Samuel, M.P., was Counsel for the defendants, and Mr. T. B. Bowen appeared to prosecute.

The evidence against all the accused, was that they plied buses on divers dates which were not licensed to ply, and that they claimed there was no plying, but that their buses were run on private hire system.

Mr. Samuel submitted that the summonses were out of order and must be dismissed on point of law. The summonses were issued by the Swansea police, in the name of Mr. Thomas Rawson, Chief-Constable, and it was counsel's contention that the police could not instigate such a prosecution without having been instructed to do so by the resolution of the Swansea Corporation, the aggrieved party. Counsel contended that there must be a specific council instruction to prosecute in each case and that a general warrant to prosecute by corporation resolution was not sufficient.

The stipendiary adjourned the case a week in order that the points raised might be considered and that the corporation instruction might be produced if it were available and necessary to make the summonses in order.

At the resumed hearing of the summonses, Mr. Bowen, in reply to the stipendiary, said that he could not produce instructions from the Swansea Corporation, by resolution, to the police to commence summonses in these cases.

Giving judgment, the Stipendiary said that the cases must be dismissed. A peculiar situation had arisen in this matter as result of a High Court (Divisional Court) judgment given in May of this year. Prior to this judgment, it was generally conceded that the police might issue such summonses for illegal plying for hire, but since that judgment, this was no longer lawful, and the specific instruction by the corporation to the police was necessary before the police could institute such summonses. As opportunity had been given to the prosecution to produce such authorisation if it existed, and they had failed to do so, the cases would be dismissed with costs against the police in amount of £5 5s. in respect to counsel's appearance, and two guineas for each of the solicitors instructing counsel.

On November 28th, the same defendants again appeared before the Stipendiary, summoned for alleged unlawful plying for hire. This time evidence was produced showing the Corporation's instruction for the prosecution to be made.

For the defence it was submitted that the cases were identical with those at the last hearing, and could not be heard. The submission was that "the summonses having already been heard, they had been put in peril" and the cases were covered by the dismissal last ordered. In other words, they could not be tried twice for the same offence.

The prosecution case was that new information having been laid, and the summonses authorised, they could now be recommenced.

After hearing evidence, the Stipendiary said that the Chief Constable had been now given authority to prosecute. The defence had not established the plea of "autrefois acquit." If the cases were carefully examined, it would be found that the test to apply was whether or not the accused person had ever stood in jeopardy of a conviction, or whether the case had been heard and decided on its merits. If the Court had no jurisdiction to hear and determine, and the proceedings failed because of that, the accused person had never stood in jeopardy. All the defendants were convicted of one offence, but in further cases there would be adjournment *sine die*, to see if there would be appeal on the point of law raised as to whether the cases could be heard or were really decided upon on the first dismissal.

WHAT IS A LICENCE?

THE question as to whether there had been proper authority for launching proceedings against Ribble Motor Services, Ltd., was raised before the Burnley magistrates on the hearing of summonses in respect of plying for hire with an unlicensed vehicle. There was no dispute as to the facts.

The Deputy Town Clerk of Burnley, said that the main question was not the one as to what was plying for hire, but rather, what was a licence. Defendants were licensed at Burnley to ply for hire in connection with certain routes, one of which was to Bury. They had extended this particular route to Manchester. The point was as to whether or not the licence issued, entitled them to ply for hire at Burnley in connection with a Manchester service. One of the conditions of the Burnley licences was that the vehicles should only travel on prescribed routes. The Burnley Watch Committee licensed another service to ply for hire locally in connection with a Manchester service, and they held that this service provided adequate travelling facilities for the public. If the contention of defendants was correct, that having obtained a licence in connection with a service to Bury, they could also ply for hire at Burnley for a Manchester service, then the whole licensing of routes was removed. It would mean that a person only needed to get a licence to the borough boundary. He contended that defendants' licences were conditional ones.

Mr. Lustgarten argued that Ribble Motor Services had plied for hire at Burnley for a number of years in regard to this particular service, Burnley to Manchester, which also meant Burnley to Bury and Manchester. It was neither law nor sense to hold that when defendants indicated that they were going somewhere beyond Bury, when they got there that they had committed a breach of the conditions which the Burnley Corporation had laid down.

Giving their decision, the chairman (Mr. Flack), said the Bench decided that the proceedings were properly instituted. They inflicted a fine of £2 and special costs in each case. Mr. Blackhurst, Preston, who represented defendants, asked for a case to be stated for appeal.

National Show of Ponies.—The National Pony Society, of 12 Hanover Square, London, have issued the schedule of their coming show of ponies at the Royal Agricultural Hall on Friday and Saturday, March 7th and 8th, 1930. The classification embraces a very wide field and facilities are provided for the exhibition of every type of pony. There is an increased range of 17 classes for polo ponies of all ages, three for children's riding ponies, and classes for all the various native breeds of this country, viz:—Dales, Dartmoor, Exmoor, Fell, Highland, New Forest, Shetland and Welsh, so that the show should provide an excellent opportunity of comparing all the various types of ponies.

Motor Notes.

A 20-ton Carrimore.—The accompanying photograph shows one of the new 20-ton Carrimore-Lynx climbing the steepest part of West Hill with full load. The photograph was taken on the steepest part of the hill which is 1 in 6, although this is not apparent in the photograph. We are informed that the machine made a standing start on this gradient without difficulty.

ONE OF THE NEW 20-TON CARRIMORE LYNX 8-WHEELERS.

CARTER, PATERSON'S NEW 4-TON ALBION.

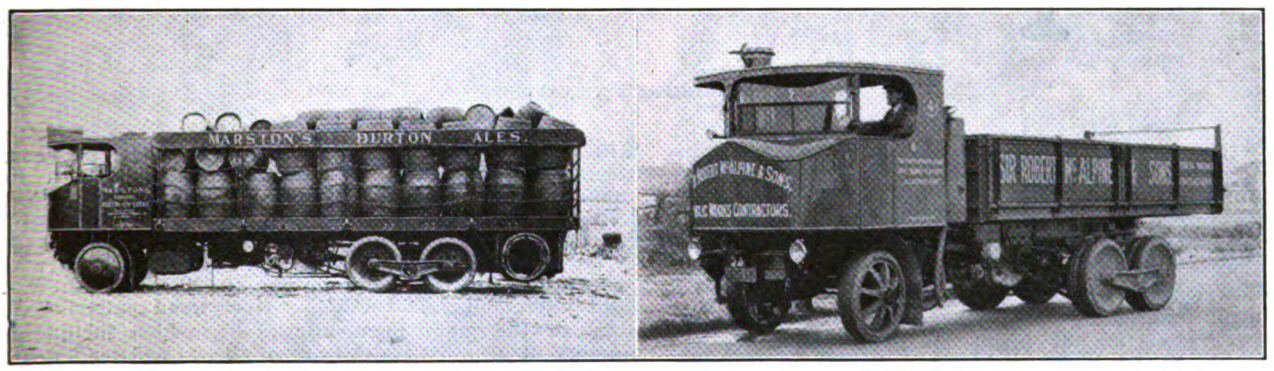
Glico No. 1.—Glico Petroleum, Ltd., Alexandra House, Queen Square, London, W.C.1, announce that their well-known motor spirit Carburine is in future to be known by the new brand name "Glico No. 1. The Anti-Pinking Spirit."

Sentinel Six-Wheelers.—The two accompanying photographs show Sentinel's D.G.6 vehicles recently delivered, one to Marston, Thompson & Evershed, Ltd., brewers, of Burton-on-Trent, and the other to Sir Robert McAlpine & Sons, for work in connection with their Mersey Tunnel contract. The brewery vehicle carries regularly the equivalent to 65 barrels of beer and is fitted with an auxiliary bunker beneath the frame and an extra water tank to enable it to do non-stop journeys. Marston, Thompson & Evershed, Ltd., have recently taken delivery of two of these vehicles. Sir Robert McAlpine's vehicle is one of six recently delivered, all of which are fitted with three way tipping bodies.

"Just-Rite" Grinding Compound.—Most garages and engineering works have had experience of Clover grinding compound in its original grease-mixed form, but not so many are familiar with the water-mixed variety marketed under the name Clover "Just-Rite" compound. Brown Brothers, Ltd., who handle these abrasives, state that it cuts with remarkable rapidity. An important feature of "Just-Rite" is its ability to remain workable, even though the job in hand has to be left for a while. No hardening up like cement as might be expected with a water-mixed compound. It is obtainable in two grades, medium and coarse, in two ounce tins, price 1/3 retail. Either grade does the entire job, it being a matter of choice which grade is used.

Carter, Paterson's New Albion.—Our photograph shows a 4-ton overtype Albion chassis on pneumatic tyres with special metal body underframe. This machine was exhibited on Carter, Paterson's stand at Olympia and is for their use.

Chassis Prices for 1930.—We have received the following 1930 chassis price lists:—Commer Cars, Ltd., Luton.—30-cwt. type 30 G.P., £365; 2-ton type G.2., £465; 2½/3-ton type 23 G.N., £555 with solid tyres, £610 with pneumatic tyres; 4-ton type 4 G.N., £750 with solid tyres, £825 with pneumatic; 5-ton type 5 G.N., £795, solid tyres, £895 pneumatic; 6/7-ton type G.6., £935 solid tyres, £995 pneumatic; 20-seater "Invader," £495, and 32/50 seater "Avenger," £995. Karrier Motors, Ltd., Huddersfield.—40-cwt. type "CY2," £470 on solid tyres, £495 pneumatic; 50-cwt. type "CYR," £475 solid tyres; 60-cwt. type "CWY," £565 solid tyres, £610 pneumatic; 80-cwt. type "GH4," £695 solid tyres, £755 pneumatic; 100-cwt. type "GH5," £750 solid tyres, £830 pneumatic; 120-cwt. type "K5," £890 solid tyres, £990 pneumatic tyres; 140-cwt. type "K7," £950 solid tyres, £1,025 pneumatic; 240-cwt. type "K6" tractor, £980 solid tyres, £1,085 pneumatic; 100-cwt. type "FM6," £1,075 pneumatic tyres; 100-cwt. type "RM6," £1,050 pneumatic; 180-cwt. type "KWF6," £1,355 pneumatic; 160-cwt. type "KWR6," £1,330 pneumatic; 240-cwt. type "TT" tractor, £770 pneumatic; 20-seater "Cutter," £675 pneumatic;



THE TWO SENTINEL D.G.6 SIX-WHEELERS REFERRED TO IN TEXT.

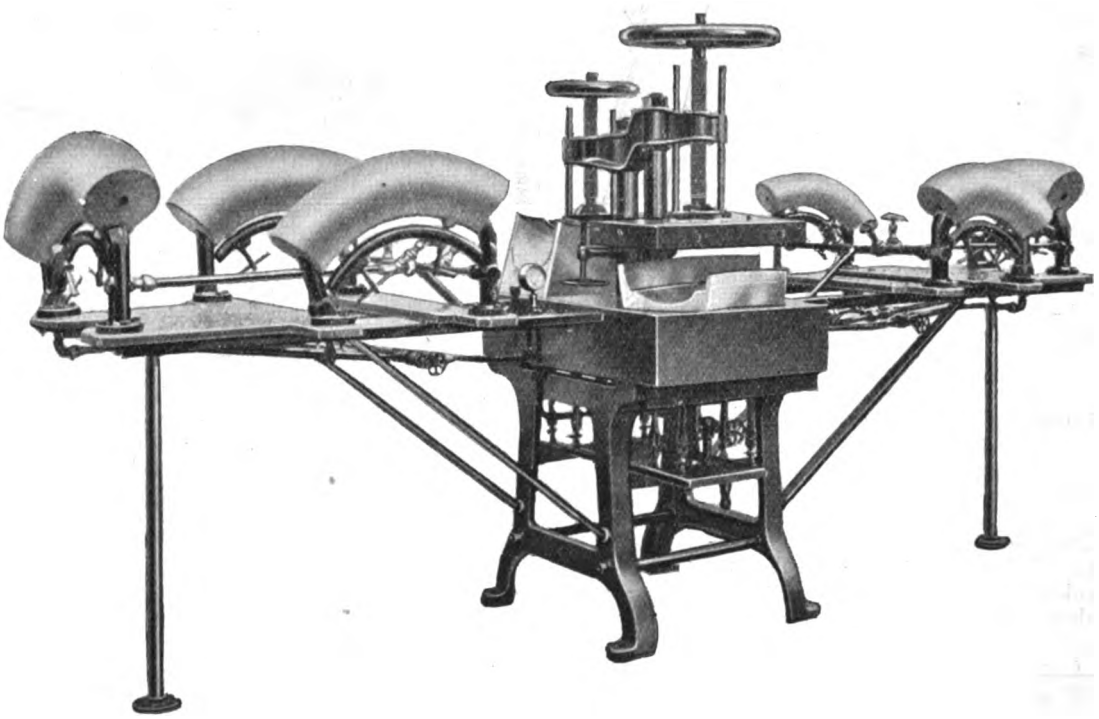
Digitized by Google

28-seater "Coaster," £725 pneumatic; 35-seater "Chaser 4," £950 pneumatic; 26-seater "Chaser 4," £950 pneumatic; 35-seater "Chaser 6," £1,050 pneumatic; 26-seater type "Chaser 6," £1,050 pneumatic; 40-seater "Clipper," £1,350 pneumatic; 68-seater "Consort," £1,525 pneumatic. Latil Industrial Vehicles, Ltd., 11, Albert Embankment, London, S.E.11.—30-35-cwt. type "JB," straight or dropped frame, £350; 30-35-cwt. type "JB," long chassis, straight frame, £395; 20-seater type "KBp," £435; 2-2½-ton type "KB2," £435; 5-ton type "NP5LL" low loader, without wheel arch, £695; 5-ton type "NTP" lorry tractor, £725; 5-ton type "JB2T" tractor, with instantaneous and automatic coupling, £495; 5-ton type "JB2T" trailer, with instantaneous and automatic coupling, £165; 6-ton type "B5" express chassis, normal straight, £925; 6-ton type "B5" express chassis, long, straight, £960; 6-ton type "B5" express chassis, long, dropped, £990; 10-ton type "TL" road tractor, £625; heavy duty tractor type "KTL," £655; agricultural and forestry tractor type "KTL," £655; 30-ton tractor type "TAR4," £1,250.

The HF. Omnipress Vulcanizer.—With the advent of giant pneumatic tyres as fitted to omnibuses and chars-a-banc, it has been necessary to consider special repairing apparatus, and Harvey Frost & Co., Ltd., 148-150, Great Portland Street, London, W.1, who are recognised the world over as the introducers of vulcanizing apparatus for general repairs, saw this need and are now in a position to offer appliances which they state will effectively repair all sizes of giant pneumatic tyres up to and including 9 in. This new vulcanizer is known as the Omnipress and is a machine which will deal with the smallest sized tyre from 90 m.m. up to 9 in., and the Company assures us that all those installing such equipments are certain of being in a position to repair effectively any type of damaged tyre offered to them. For the specialist, who only wishes to undertake tyre repairs up to 6 in., then the HF A.1. press will give complete satisfaction. From the illustration of the Omnipress vulcanizer it will be seen that with the powerful screw attachment fitted, extreme pressure can be obtained which is most essential when dealing with the repairs of giant tyres. Harvey Frost also are now offering a Dual Salvage Crane which really comprises an open truck body and powerful crane, permitting the chassis to which it is attached to be used for general cartage work. In this connection the crane is a valuable asset as it enables loads up to 1-ton to be lifted from the ground level on to the truck body but when the need arises the crane is immediately available for salvage work. The truck body is 9 ft. 6 in. long, 5 ft. 6 in. wide and 2 ft. deep but can be altered to suit requirements. Each of the two independent hoists has a capacity of 30-cwt., the winches being operated from either or both sides of the vehicle as convenient. The jib is arranged to fold back against the driver's cab when not in use leaving an almost unrestricted floor space for goods. Steadying jacks are affixed to the tailboards for use when heavy loads are carried on the crane and a special type telescopic twin-armed combination distance and towing bar can be added to the outfit. The total weight is 13-cwt., making the crane suitable for attaching to trucks of no less than 30-cwt. capacity.

Vulcans for the Argentine.—Vulcan Motor & Engineering Co. (1906), Ltd., Crossens, Southport, have recently received an order from the Argentine for a 30-cwt. forward control chassis, 50-cwt. forward control chassis, 3/5-ton medium 6-wheeled chassis and 35-cwt. "Shaftesbury" low loading chassis.

Tyres by Avon.—The Avon India Rubber Co., Ltd., 343-5, Euston Road, London, N.W.1, have issued a new and interesting brochure illustrating and describing the new Avon tyres; the brochure also contains a mass of useful information concerning the care and management of Avon tyres of all descriptions both solid and pneumatic. In a foreword it is stated that the new Avon wired balloon motor cover carries a handsome buttressed tread of the three-ribbed type and is offered in a full range of normal and heavy duty sizes—the former to be known as Avon and the latter as Avon "Loadster." For beaded-edge and flat-base rims carrying high pressure tyres the "Tricord" type is retained so far as outward appearances go, but nevertheless the tyres are new in conception and construction. New tread patterns distinguish the giant pneumatic range, which includes a number of new sizes. All are of the "Loadster" grade, and a few sizes are available of "Loadster" extra-heavy construction. There is also a useful group of low-pressure (bus balloon) giants and three sizes of chevron-grooved tractor tyres, as used on War Office six-wheelers. All these are new on the Avon list.

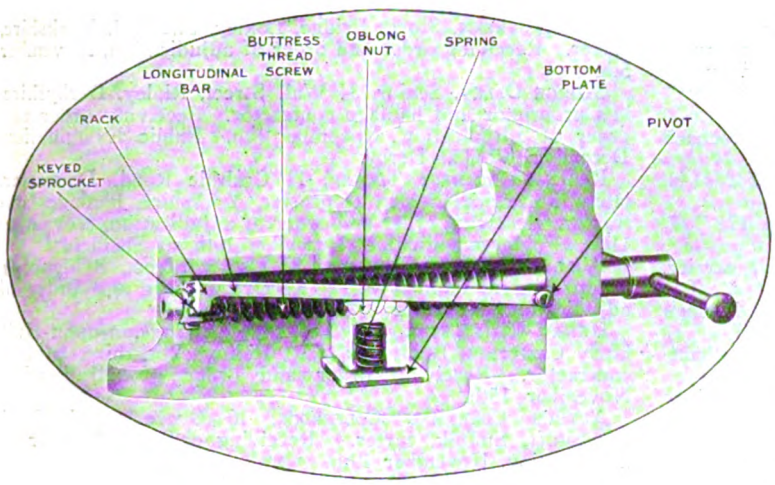


THE H.F. OMNIPRESS VULCANIZER.

"The Nickel Bulletin."—The December number of "The Nickel Bulletin," issued by the Bureau of Information on Nickel, The Mond Nickel Company, Limited, Imperial Chemical House, Millbank, London, S.W.1, contains much valuable information concerning the application of nickel cast iron in the motor manufacturing and commercial transport industries generally. The publication also contains abstracts and references concerning applications, properties, technology, electrodeposition and patents, all relating to nickel.

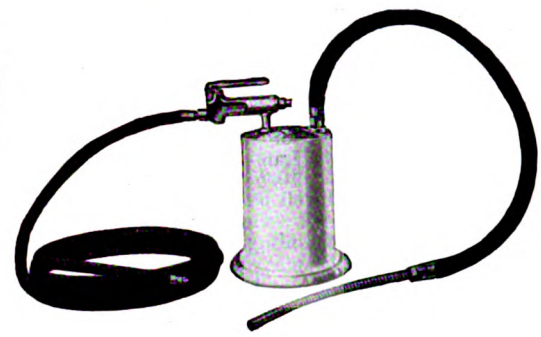
Digitized by Google

The Beatall Vice.—Our attention has been drawn to an entirely new type of engineers' vice known as the "Beatall." The main features of the patent are the quick action device and the provision made for the ordinary screw vice should the quick action device go wrong, which, however, is practically impossible. The action is as follows:—By giving the operating screw a half turn to the left a rachet on the end of a threaded screw depresses a longitudinal bar; this presses the spring and frees the operating nut from contact with the buttress thread of the screw. When the anti-clockwise pressure is taken off the nut comes back into action and the vice can be used like an ordinary one. A special feature is that the mechanism is protected by being housed in the vice. The vice is made in three sizes, namely, 3¼ in., 4¼ in. and 5¼ in. jaw opening and 2½ in., 3¼ in. and 4½ in. depth of jaw; prices 28/6, 41/- and 50/6 respectively. The vice is manufactured by Andrew Page & Son, Ltd., 99, Albion Street, Leeds, and 21, Sycamore Street, Sheffield.



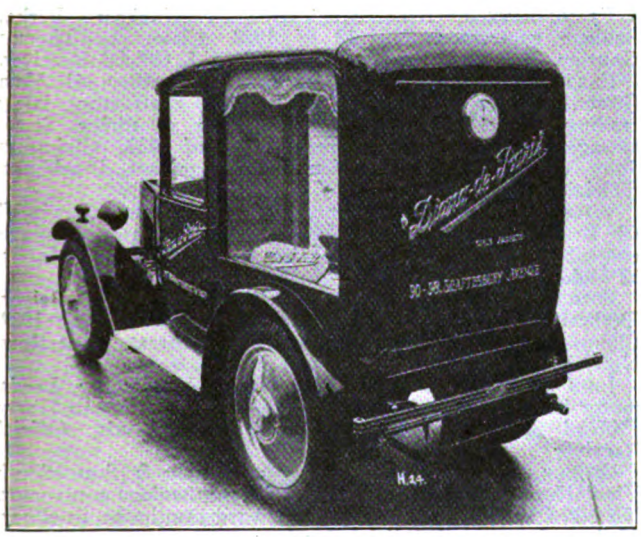
THE "BEATALL" VICE.

The "Air-Way" Flusher.—H. A. Moore & Co., Ltd., 150, Southampton Row, London, W.C.1, are marketing the "Air-Way" flusher—an equipment for cleaning old grease from rear axles or transmissions. It reduces grease to a liquid and removes it with great thoroughness and rapidity. It operates from the compressed air supply line. Utilising a cleaning fluid, agitated by air pressure, it is claimed that it will clean and flush the most inaccessible parts of a gear case and its high vacuum will remove practically the last drop of liquid in the case. It consists of a cylindrical container of heavy pressed steel and has a capacity of one gallon. The operating valve is of brass, nickel plated. It is supplied with 12 ft. of ¼ in. air hose with ¼ in. connections. Its weight is 9 lb.

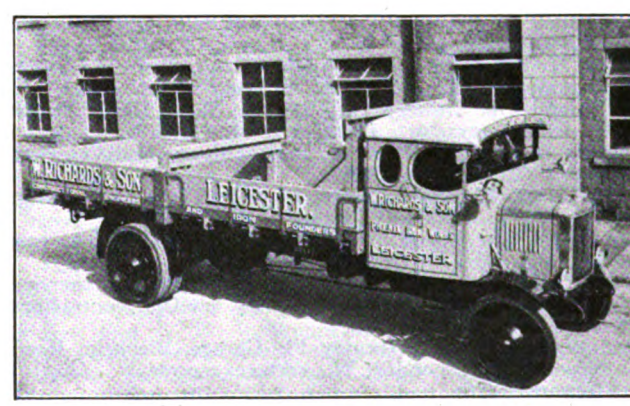


THE MOORE "AIR-WAY" FLUSHER.

SKF Power Transmission Equipment.—We have received from the Skefko Ball Bearing Co., Ltd., Luton, an excellent publication giving the fullest possible particulars of the SKF ball and roller bearing power transmission equipment, including SKF split belt pulleys. It has been the firm's endeavour to make the publication as comprehensive as possible on all matters concerning the erection and maintenance of SKF line shafting accessories, and in addition to the standard ranges of transmission accessories previously listed they have included supplementary ranges which are available at other SKF factories. Copies of the catalogue are now available for all those genuinely interested.



A BONALLACK PUBLICITY BODY.



A KARRIER 7-TONNER FOR W. RICHARDS & SON, LEICESTER.

Bonallack Coach Work.—The accompanying illustration shows a special body mounted on a Morris "Minor" chassis. It is designed so as to represent as nearly as possible one of the shop windows of Messrs. Diana de Paris, of Shaftesbury Avenue, London, W.1. The show windows on each side are fitted with mirrors at back and side and the floor is parquet and lighting is by vacuum tube lamps. Each window is designed to show three model dresses or blouses on stands. The back represents part of the shop premises between the windows, in which the clock is conspicuous. The body has a capacity for about 30 dress boxes. The spare wheel is carried in a special compartment under the floor.

Recent Karrier Deliveries.—Karrier Motors, Ltd., Karrier Works, Huddersfield, announce that during the past few weeks they have received many orders for their popular "K" type goods models, and a very satisfactory number of deliveries of both chassis and finished vehicles have been made to users in various trades, amongst these is a 5-ton flat lorry with 4-ton trailer for fast delivery in Scotland. A hinged sided 7-tonner for W. Richards & Son, Phoenix Ironworks, Leicester, and an hydraulically operated 5-ton end tipper for the Manchester Corporation Waterworks.

County Court Judgments.

THE following returns from the Registry of County Courts' Judgments, Whitehall, have been received relating to judgments entered up in the respective County Courts of England and Wales. Publication does not imply inability to pay. Many judgments may have been settled between the parties or paid. Judgments settled otherwise than through the Court may appear unless "satisfaction" is entered up within twenty-one days from judgment or allocatur. Registered judgments are not necessarily for debts. They may be for damages or otherwise, they may relate to actions *bona fide* contested between the parties, or they may be against defendants, liable in a representative capacity, and not personally; but no distinction is made on the register. Judgments are not returned to registry if satisfied in Court books within twenty-one days.
